3. Dyes.—Red is most often obtained from madder root (*Rubia tinctorum*). Thus the red of the Noin Ula carpets is madder with the usual alum mordant. The shade, which runs through the gamut of reds and pinks to reddish brown and orange, varies with the age of the plant, and also other factors, including the mordant, the density of the solution, and the duration of the immersion. Some reds, however, are obtained from the *Coccus ilicis* which breeds on oaks in the Near East, related to but not identical with, the cochineal (*q.v.*; *Coccus cacti*) of Mexico. Blues are made from indigo. The yellow of the Noin Ula carpet is rhamnetin, the dye obtained from unripe berries of various bushes of the genus *Rhamnus*. The famous saffron (*q.v.*) dye, made from the dried stigmas and part of the style of a crocus (*Crocus sativus*), is too expensive to use to any extent. Greens are usually blue plus yellow; violets (only rarely used), red plus blue. Black, when not the natural wool, is done with iron filings in citric acid, a corrosive dye whose destructive effect on wool especially is often conspicuous in old rugs. White is the natural wool, but occasionally, when a sharper white is desired, a little cotton is introduced.

Carpets in museums are almost all underlighted. Oriental fabrics, in particular, were all woven and used in regions where the light is very bright and their colours are at their maximum and in proper relation to one another only when the illumination is strong.

4. Design.—Rugs were not designed purely to be seen on the floor. Many of them were worked on vertical elements and the designs are traditional and derivative and not very often planned in relation to the destined environment of the carpet. The great court carpets of the 16th century, for example, were the work of illuminators who were accustomed to think of the book page and a vertical design. The designs of the great carpets, when seen on the floor from a normal eye height, are compressed and distorted. Their full effect comes only when hung where they can be viewed so that the eye is nearly equidistant from all points.

Both the pile carpet technique and the flat techniques, whether straight tapestry or the looped Shemakha weaving, permit unlimited variation within the design—in sharp contrast to all shuttle weaving which necessitates regularly recurring repeats. But while the rug designer thus theoretically has unrestricted liberty, he is constrained by habit, tradition, and his own aesthetic judgment. A division into field and border is the basis of all rug design. The border serves, like the cornice on a building or the frame on a picture, to emphasize the limits, isolate the field, and sometimes control the implied movements of the interior pattern. The value of a border had already been recognized by pottery painters in 4000 B.C. and is fully developed in rug patterns from Assyrian times onward.

The border invariably consists of a minimum of three members: the main band, which varies greatly in width according to the size of the rug and the elaborateness of the field design, and the inner and outer guard stripes, decidedly subordinate bands on either side of the main band. These latter may be the same on both sides of the band or different. Multiple border systems also are quite common, as on one of the Noin Ula carpets, very elaborate schemes having been developed in mosaic floors of the Roman period. Some of the greatest carpets, however, have the simplest border arrangements, while on certain types of commercially produced carpets of the late 19th and early 20th centuries meaninglessly multiple and complex compositions were developed. The court designers of the 16th century developed many beautiful correlations of rhythm and accent between border and field.

The field may be decorated with an allover pattern, a panel composition, or a medallion system. The allover pattern may be of identical repeats, either juxtaposed or evenly spaced, though the latter, while common on textiles, is rare on carpets; or it may be of varied motives in a unified system, *e.g.*, different plant forms of about the same size, but even this freest type of design almost invariably includes bilaterally balanced repetitions which perhaps reflect the human bilateral equilibrium. The latter type of design is found most typically in formalized representations of the parks or woods which were a feature of Persian palace grounds. An-

other type of allover design appears entirely free but is actually organized on systems of scrolling stems, notably on the east Persian carpets of the 16th–17th centuries.

The value of panel subdivisions for controlling patterns had been discovered in a simple rectangular version by the Upper Paleolithic Period (*c.* 25000 B.C.), and panel systems have been a basic form of design since 4000 B.C., when pottery painters were already devising varied systems. On carpets the lattice provides the simplest division of the field, often a diagonal lattice as on the embroidered carpet from Noin Ula, a scheme that also appears on Sasanian capitals and in Coptic tapestries. But a characteristic field design of the court carpets of the Shah Abbas period, the so-called Vase pattern, is constructed from the ogee, a motive that becomes prominent in Near Eastern textile design in the 14th century (see *Persia,* above). Simple rectangular paneling—really a large-scale check—is typical of one style of Spanish rugs of the 15th–16th centuries.

The most frequent medallion composition consists of a more or less elaborate medallion superimposed on the centre of a patterned field. This is also often complemented with corner pieces, which are typically quadrants of the central medallion.

But multiple-medallion systems also are developed: either a succession or a chain of medallions on the vertical axis; or two or more forms of medallions alternating in bands, a scheme typical of the Turkish ("Usak") carpets of the 16th–17th centuries; or systematically spotted medallions which may or may not be interconnected, or which may interlock so that the scheme logically becomes an elaborate lattice.

Persian carpets of the great period (15th–17th centuries) commonly have multiple-design schemes, that is, composition systems on two or more "levels." The simplest is the medallion superimposed on an allover design, but more typical are subtler inventions such as two- or three-spiral stem systems, sometimes overlarded with large-scale cloud bands, all intertwining but each carried independently to completion. The finer Vase carpets have double or triple ogival lattices set at different intervals ("staggered"), each with its own centre and tangent motives which also serve other functions in the other systems. What at first sight appears to be a great multiplicity of independent motives thus proves on careful exploration to be ingeniously contrived and firmly controlled.

Occasionally stripe systems are used, either vertical or diagonal, but this conception is more natural to shuttle-woven fabrics, and when employed in the freer techniques of rug weaving is probably an imitation of textiles.

5. Patterns.—Four main classes of motives are used: geometrical, conventional, plant, and illustrative. The geometrical repertoire is built up from variations and combinations of meanders, polygons, crosses, and stars. Meanders, chiefly for borders, range from the simple serration which was employed from earliest times (actually already much used in the Upper Paleolithic Period) to fairly complex hooked forms, characteristically the angular "running wave" or "Greek key," which is also very ancient. Such meanders typically constitute reciprocals, *i.e.,* designs which form the identical shape in the positive and negative areas, so that when they are executed in contrasted colours they can be alternatively interpreted; or differentiated reciprocals, where the negative space created by the main motive has a different but destructive form, a type of narrow border well-developed in early medieval textile design. Little trefoil reciprocals are used for guard stripes in the Caucasus, central Persia (so-called *Polonaise*), and in India. Chief among the polygons employed are the lozenge and the octagon. The Maltese cross is frequent, as is the gamma cross, or swastika. The purely geometrical stars are usually based on the cross or the octagon. Many of these motives, which are rudimentary and very ancient, may have originated in basket weaving and the related reed-mat plaiting, for they are natural to both techniques; but in rug weaving they have survived chiefly in the work of central Asia, Asia Minor, and the Caucasus, in both pile-knotted and flat-woven fabrics.

One of the principal motives in the 16th- and 17th-century Persian carpets is the so-called arabesque, an ambiguous term that generally implies an intricate scrolling-vine system. In a common Persian ornamental scheme two asymmetrical members cross at an acute angle, forming a lilylike blossom, and then describe curves in opposite directions, readily continuing into further scroll systems. This highly individual form was well begun in China in the late Chou period (*c.* 600 B.C.), notably on a few bronze mirrors, and is beautifully developed during the Han dynasty (202 B.C.–A.D. 221). Although it does not appear in Persia until the 12th century (on pottery and architectural stucco ornament), and although its intermediate history has not been traced in either country, when it does reemerge the essential forms are so close to those of early China that a hiatus and reinvention seem improbable.

Directly traceable to China, on the other hand, are the cloud

knot (or *'tchi*) and cloud band or ribbon—both begun by the Han period at least and with a continuous history thereafter. The cloud knot, a feature of the court carpets of the time of Shah Abbas, was continued to the end of the 18th century. The cloud band or ribbon, already skilfully used on book covers, manuscript illumination, and in architectural faience, became important on 16th-century carpets and was employed with especial elegance and skill by the Persian designers, and perhaps most beautifully in the Turkish court carpets which owed much to Persian inspiration. The combination moved from Syrian textile design into Asia Minor textile design with the Ottoman Turkish conquest in the 15th century and became typical of one group of 16th–17th-century Turkish carpets.

Palmettes, a second major class of conventional motives dominant in a considerable range of carpet designs from Asia Minor to India, are of plant derivation, and are justifiably named in that they originated in Assyrian design as stylizations of the palm, a symbol of the vitalistic power, often, if not always, in relation to the moon. Many of the almost uncountable variations that developed through the centuries continued to refer directly to the palm. Others, however, also beginning early in the 1st millennium B.C., derived from the lotus blossom, a complementary motive since it was connected primarily with the fertility symbolism of the sun. Still others involved the pomegranate, another fertility symbol, utilizing primarily the fruit, while yet another group presented the general vitalistic emblem, the vine, this last design being built on the single leaf. The forms of all these four main types of palmettes found in the rug designs are directly descended from styles current in textile designs from the 4th century onward, and are often modified by Chinese influences. These patterns in

the 16th and early 17th centuries were beautifully and realistically elaborated, and blossoms like the Chinese peony sometimes compete with the more conventional lotus. The lanceolate leaf often associated with palmettes, especially in east Persian designs, is also largely conventional.

Outstanding among the more naturalistic plants are the cypresses and blossoming fruit trees, symbolizing life eternal and resurrection respectively. Willows are prominent in the Shah Abbas Vase carpet, as are jasmine flowers, and in Turkish court carpets, tulips. Many minor foliate and floral forms had no specific botanical identification though they give a realistic effect. Naturalistic red or pink roses, as on Karabakh and Kerman rugs from the 18th–19th centuries, are imitated from French patterns or English chintz and had no place in the old Persian repertoire, despite the importance of the rose in Persian poetry, life, and even economy, and its ancient symbolic importance throughout western Asia as an alternative to the lotus blossom.

In one widely distributed class of design some of the plant forms grow out of a vase, a development of an older symbolic scheme, portraying the Tree of Life, sustained by the Water of Life as implied by the "cloud jar," a design already well developed in Babylon.

The most important illustrative motifs, other than naturalistic plants, are those connected with the garden and the hunt: many small songbirds (particularly, in Persia, the nightingale), the *fêng huang* (pheasant) taken over from China and much favoured in the 16th century, and occasionally the peacock, which farther west in Asia had had considerable symbolic value; the great felines —lions and the semiconventional lion mask, sometimes used as the centre of a palmette; tigers; cheetahs; bears; foxes; deer of numerous species; goats, sometimes picturesquely prancing; or the wild ass, a fleet prey; ferocious looking Chinese dragons and the gentle *kilim*, a fantastic equine likewise imported from China. Fish sometimes swim in pools or streams, or are conventionally paired to suggest an escutcheon in the borders of the carpet. Huntsmen, usually mounted, are the major human figures though musicians also occur. Angels are occasionally present.

The underlying theme of both the conventional and illustrative vocabularies is nearly always fertility or abundance. The great carpet of Ardabil, for example, embodies a huge golden stellate medallion, developed from the multiple-pointed rosette that from time immemorial symbolized the sun. At its centre are four lotus blossoms floating on a little gray-blue pool, which represents the source of rain in the heavens. The medallion thus symbolizes the two basic vitalizing elements—sun and water. As proof of its magical potency, a complex system of tendrils and blossoms issues from it.

III. PRACTICAL CONSIDERATIONS

1. Uses of Carpets.—While many of the finest rugs were special productions for a wealthy clientele, it must be remembered that the common people also had their rugs. Throughout the Near East rugs have from the beginning been in common use and their universality was one of the reasons for their excellence. The English traveler Herbert, writing in the 17th century, said there was no house so poor but what it was furnished with carpets. From time immemorial carpets covered the floors of house and tent as well as mosque and palace, and served many other uses besides. They made handsome portieres and were sometimes hung on the wall like tapestries. They were a convenient portable and durable form of wealth, served as tribute money, and were frequently gifts of one state to another. They were used as blankets, canopies, and tomb covers. In past times they were also handy for committing and concealing murder. The last caliph of Baghdad (1258) made his tragic exit via a carpet in which he was rolled up and beaten to death, a not uncommon mode of execution, quite the reverse of Cleopatra's dramatic entrance to the presence of Julius Caesar when she stepped out of an unrolled rug. Woven with an apex that could be pointed to Mecca, they served as prayer mats for an individual or, given sufficient size and reduplicate prayer panels, they could serve simultaneously for a whole family or some religious fraternity. They made excellent saddle covers and carryall bags as well. These modest rugs had their own merits. They were closer to the life of the people; the best of them have an air of genuineness and respect for the limits of the craft. On them were lavished loving care, and into them were woven life-protecting symbols which in early times people understood and took seriously; even now the meanings of the more obvious patterns are dimly remembered.

2. Size and Shape.—Rugs, a term understood to include all carpets for use on the floor, are mostly rectangular, though occasionally pieces are made to fit into irregular spaces, and a few round carpets are known, probably woven for tents. The rectangle may vary from a square to a strip at least six times as long as it is wide. A very usual ratio is about three to two. The strips, called runners or *kanara*, made in pairs to go along the sides of a Persian room, are very useful in corridors. A very common size for small rugs is about $6\frac{1}{2} \times 4\frac{1}{2}$ ft., while large ones may reach 25 ft. in length or occasionally more.

A very common room size for modern carpets is 10×14 ft., but not for old carpets which are much narrower in proportion to length, owing primarily to their use in combinations in the Oriental house. Some old carpets are nearly three times as long as wide; for example, the famous McCormick Vase carpet now in the Metropolitan Museum is 10×29 ft. Some of the palace carpets woven in the early 17th century (especially of the Herat type) are 50 ft. long. There are recently woven fine quality hall carpets in the ministry of foreign affairs in Teheran that are approximately 6×125 ft. (A. U. P.; X.)

3. Care of Carpets.—It is important that a carpet for use should be soundly made. Accordingly, when buying, the first thing to ascertain is that the foundation threads are sound and strong and that the pile is not unduly worn away. If a rug is held up to the light, holes and thin places are often revealed that were quite unnoticed when it lay on the floor. Holes that have been properly repaired are of little consequence. Few rugs have perfectly parallel sides but they should be of good shape and lie flat on the floor. A rug that is not flat tends to wear badly in the baggy places, but certain good rugs, such as the Shiraz, are rarely quite free from this defect. A guarantee should be asked that the rug has not been chemically treated, as is too often done with the object of effecting a supposed improvement in colour. Such treatment usually results in a hopeless deterioration of the yarns. Undesirable, though less destructive, is the process of hot-rolling, which gives to inferior wool a silky gloss that is only transitory.

Carpets will give remarkably long service if treated with proper consideration. Their two great enemies, apart from the inevitable destructive effect of wear, are moths and damp. The former is best kept at bay by frequent moving or handling and by regular exposure to light and air. If rugs must be stored, then inspection at intervals is essential. A carpet in use is rarely in danger from moths. Certain chemical applications will render the wool uneatable by moths. Damp will in time rot the threads and destroy the fabric, but it can be avoided by obvious means. If any mechanical injury is suffered, such as a cut or burn, the damage should be dealt with as soon as possible by a competent repairer, for such lesions get worse very quickly. In ordinary use, quite apart from accident, the ends and sides often tend to wear and fray out, in which case the parts should be reovercast—a very simple operation if done in time. Places in the middle of the carpet that are locally worn or damaged can have new knots inserted and even large holes can be restored so as to be almost as good as new, though such work is rather expensive. In carpets of lesser value, instead of new knotting, patches cut from a suitable rug can often be inserted at less cost, and sometimes a serviceable small rug can be made from a larger worn one by cutting away the bad parts.

From time to time, but not more often than necessary, carpets should be cleaned. If there is any doubt as to the stability of dyes, the cleaning should be entrusted to one of the many firms that specialize in this kind of work. In many cases, however, surface washing with a limited supply of hot water and carpet soap applied with a stiff brush may be done at home, though drying the fabric afterward is often a difficulty, as a clean and airy place must be available for some days. It is most important to wash out all

traces of whatever cleaning agent is used. In ordinary use carpets are properly kept free from dust by brushing or by means of a vacuum cleaner, but in all cases where a brush is employed it is most important that it should not be used against the lie of the pile.

RUGBY, a municipal borough (1932) in the Rugby parliamentary division of Warwickshire, Eng., south of the Warwickshire Avon, 17 mi. (27 km.) ENE of Warwick by road. Pop. (1961) 51,698. Area 10.9 sq.mi. (28 sq.km.). Rugby was originally a hamlet of the adjoining parish of Clifton-upon-Dunsmore, and is separately treated as such in Domesday Book (where it is called Rocheberie). It became a separate parish in the reign of Henry III, who granted the town a weekly market and a yearly fair.

Oliver Cromwell was quartered there in 1645, and William III passed through on his way to Ireland. The town was not of great importance until the 19th century, its rise being mainly due to the advent of railways. It is an important railway junction with extensive engineering and electrical works, and a very large cattle market.

Rugby School for boys was founded and endowed under the will (1567) of Lawrence Sheriff of Rugby. The endowment consisted of the parsonage of Brownsover, Sheriff's mansion house in Rugby, and one-third (8 ac.) of his estate in Middlesex, which, being let in building leases, gradually increased in value. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the south side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771–1830); the chapel was rebuilt in 1872.

The Temple Observatory, containing an equatorial refractor by the U.S. optician Alvan Clark, was built in 1877 and the Temple reading room and the art museum were built in 1878. The Temple speech room was opened in 1909, the science schools in 1914 (enlarged in 1940), and the music schools in 1925 (enlarged in 1939). The rebuilding enabled the school to expand rapidly and become one of the largest in the country.

Tom Brown's School Days by Thomas Hughes is a chronicle of the period of the headmastership of Thomas Arnold (1828–42). Rugby football originated at the school (*see* FOOTBALL).

RUGBY FOOTBALL: *see* FOOTBALL.

RÜGEN, the largest island in Germany in the *Bezirk* (district) of Rostock, German Democratic Republic. It is situated in the Baltic Sea directly opposite Stralsund, 2 mi. (3 km.) off the northwest coast of Pomerania, from which it is separated by the narrow Strelasund, or Bodden. Its greatest length from north to south is 32 mi. (51 km.); its greatest breadth is 25 mi. (40 km.); and its area is 358 sq.mi. (927 sq.km.). The coastline is exceedingly irregular, as Rügen originally consisted of several separate islands which in geologically Recent times have been joined together by strips of land. The general name is applied locally only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the southeast; and the chief neighbouring islands are Ummanz and Hiddensee, both off the west coast.

The surface of Rügen gradually rises toward the west to Rugard (299 ft. [91 m.])—the "eye of Rügen"—near Bergen, but the highest point is the Piekberg (528 ft. [161 m.]) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. The most beautiful and attractive part of the island is the east coast, with beech woods and chalk cliffs, the promontory of Stubbenkammer, where the cliffs rise to 400 ft., being the finest point. The east of Jasmund is clothed with an extensive beech wood in which lies the Borg, or Hertha Lake. Connected with Jasmund by the narrow isthmus of Schaabe to the west is the peninsula of Wittow, the most fertile part of the island. At the northeast extremity rises the height of Arkona, with a lighthouse.

Rügen is connected to the mainland by the Rügendamm, a road and rail embankment 1½ mi. long over the Strelasund between Stralsund and Altefähr. A railway with branch lines traverses the island, passing the chief town Bergen to Sassnitz on the northeast coast, the base of the deep-sea fishery and ferry station for Trelleborg, Swed. Resorts include Lohme, Binz, Sellin, Göhren, and Lauterbach-Putbus.

The morainic soil is fertile and sugar beet, oats, rye, and potatoes are grown. Cattle and sheep are reared on the drier land. The chief industry is the herring fishery and there are chalk pits in Jasmund. The tourist trade is also important. The poet and patriot Ernst Moritz Arndt (*q.v.*) was born at Schoritz. Rügen is the setting of *The Adventures of Elizabeth in Rügen* by Mary Annette Russell, the author of *Elizabeth and Her German Garden.*

Rügen is rich in prehistoric remains. The original Germanic inhabitants were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stubnitz and elsewhere Huns' and giants' graves are common; and near Hertha Lake are the ruins of an ancient edifice which some have sought to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On the promontory of Arkona in Wittow are the remains of an ancient fortress of the Wends enclosing a pagan temple which was destroyed in 1168 by the Danish king, Waldemar I, when he made himself master of the island. Rügen was ruled then by a succession of native princes under Danish supremacy until 1218. In 1325 Rügen came under Pomeranian suzerainty, being united with the duchy of Pomerania in 1478. In 1648 it passed to Sweden and in 1815 to Prussia.

RUGGLES-BRISE, SIR EVELYN (1857–1935), prison reformer, was instrumental in the founding and development of the Borstal system (*q.v.*) of penal treatment. He was born Dec. 6, 1857, at Finchingfield, in Essex. He received his education at Eton and Oxford, from which he received an honours degree in 1880. After eight years as private secretary to home secretaries

he received appointment as prison commissioner in 1895. At that time the Gladstone Committee made its report recommending significant changes in prison administration; it was Ruggles-Brise's duty as prison commissioner to apply the recommendations, and chief among his accomplishments was the establishment of what grew to be the Borstal system. The Gladstone Committee's position was that young offenders (16–21 years of age) should not be subjected to the harsh punitive treatment that was administered to older, less tractable prisoners; that they should be given education and industrial training at a "penal reformatory" under the supervision of a qualified staff; and that after release they should receive additional help.

Ruggles-Brise visited the United States in 1897 to study the state reformatory system; upon his return to England he collected together at the convict prison at Borstal, Kent, a group of young prisoners to implement the program. In 1908 at the urging of Ruggles-Brise and others, Parliament established the system that permitted magistrates to prescribe "Borstal detention" as a separate sentence for young offenders. In 1910 he became chairman of the International Prison Commission, on which he had actively served as a member for many years. He retired in 1921 and died at Peaslake, Surrey, August 18, 1935.

RUHR, a river of Germany and a major industrial region. The Ruhr River is 146 mi. (235 km.) long, an important right-bank tributary of the lower Rhine. It rises on the north side of Winterberg in the Sauerland, at a 2,376-ft. altitude. It flows north and then west in a deep, well-wooded valley past Arnsberg. Shortly after reaching Neheim it bends southwest and skirts the southern border of the coal-mining district in a tortuous course that passes Witten, Steele, Kettwig, and Mülheim, then joins the Rhine at Ruhrort. The river is navigable from Witten downward, by the aid of 11 locks. Its chief affluents are the Möhne (right) and Lenne (left).

The river has given its name to the largest single industrial area in the world. Although this area (the Ruhrgebiet or Ruhr) has no separate administrative entity it is generally accepted as comprising the district on the right bank of the Rhine as far east as Hamm between the Lippe and Ruhr rivers. Its area is about 1,280 sq.mi. (3,320 sq.km.) and its population (1961 census) 4,985,231. Five towns—Essen, Dortmund, Duisburg, Gelsenkirchen, and Bochum —each had a population of more than 350,000.

The Ruhr coalfield (which extends west as well as east of the Rhine) is one of the largest in the world. In the early 1960s its production was about 80% of the bituminous coal output of the Federal Republic of Germany. In that period the Ruhr district also supplied about 60% of West German steel production. Many kinds of chemical industries developed in the area.

Before World War I most of the iron and steel works in the German-occupied part of Lorraine were owned by or closely affiliated with concerns in the Ruhr, and some of the low-grade iron ore of Lorraine went to the blast furnaces of this region. On the other hand the coke of the Ruhr was needed for smelting Lorraine ores, while the finished iron and steel goods of Lorraine found their market in southwestern Germany.

The Interwar Period.—The return of Alsace-Lorraine to France and the retirement of Luxembourg from the German Customs Union reduced Germany's home supply of iron ore by 80% and led to the greater use of low-grade ores in north Germany. At the same time France became the greatest iron-ore producing country of Europe; moreover it acquired the well-equipped iron and steel mills in Lorraine, expropriating the German iron- and steelmasters. It also temporarily administered the Saar mines, but as the Saar coal did not coke well, special clauses in the Treaty of Versailles guaranteed to the Allies a regular supply of Ruhr coal and coke at statutory prices.

Political pressure apart, however, the German coalmasters held the winning hand. Compensation from the German government enabled them to erect new iron and steel works in the Ruhr, and to modernize and rationalize the coal-mining and coking industries. Plant facilities were adapted for the use of imported ores, chiefly the high-grade ores of Sweden. Smelting in Lorraine, on the other hand, depended on the regular supply of Ruhr coke, and the export of finished products depended mainly on German markets which were open to France without duty for five years. Thus those who controlled the Ruhr coal could influence the Lorraine iron and steel industry.

Deficiencies in German reparation deliveries of Ruhr coal and coke led in 1921 to French military occupation of Düsseldorf, Duisburg, and Ruhrort. Further deficiencies, stated by the Allied Reparation Commission to be "intentional," caused the French to occupy the entire Ruhr region in January 1923. German passive resistance paralyzed the economic life of the region and was the deciding factor in the collapse of the German currency. (*See* GERMANY: *History.*) The dispute was settled when in August 1924 the Allies and Germany agreed to accept the Dawes Plan for reparations. The occupation of the Ruhr ended on July 31, 1925, when French troops left Essen and Mülheim, the formerly occupied districts of Düsseldorf, Duisburg, and Ruhrort being evacuated on Aug. 25.

World War II and After.—The heavy industry of the Ruhr played an important part in Germany's preparations for World War II. Plants were worked at capacity during the Hitler period, though no important new plant was built. Before the war began, annual pig-iron production was about 15,000,000 tons and that of finished steel goods about 12,000,000 tons. Coal output exceeded 110,000,000 tons, much of which was coked; and chemical industries based on coal tar were greatly expanded.

The role of the Ruhr industrialists in bringing Hitler to power and in furthering German rearmament has probably been exaggerated, but was nevertheless considerable. They themselves made far-reaching claims, probably in the hope of standing well with the Nazis. But without the industries and resources of the Ruhr, the power of Germany to wage war would have been signally reduced.

Much of the Ruhr was in ruins by the end of World War II, and more than one-third of the coal mines had discontinued operations completely or were heavily damaged. The capture in April 1945 of 325,000 German troops who were trapped in the Ruhr pocket by the U.S. 1st and 9th armies was one of the outstanding successes of the Allied campaign in Western Europe (*see* WORLD WAR II).

The Allies saw the Ruhr as a prime source of Germany's military strength and its industrialists as a leading factor in German aggression. They proposed to eradicate the danger by reducing the capacity of the Ruhr through dismantling industrial equipment deemed redundant and by breaking up the large manufacturing concerns, which were regarded as excessive concentrations of economic power. These policies were unsuccessful because, in the changed political situation after 1947, they were unrealistic. Dismantling was slowed down; then it ceased, and gave place to modernization and rebuilding. The firms created by the splintering of the older concerns were subsequently merged to form units distantly resembling those operating before the war.

The short phase of dismantling was followed by one of controlled rebuilding. The International Authority for the Ruhr was set up in April 1949, to secure an equitable distribution of the Ruhr's resources, especially coking coal. It was dissolved when, in August 1952, its functions were largely taken over by the newly created European Coal and Steel Community (ECSC).

The sovereignty of the Federal Republic of Germany was reestablished in October 1954, and this ended all Allied control over German industry. Thereafter, the only restriction on the Ruhr industries was that exercised first by the ECSC and later by the European Economic Community.

In the conditions of an expanding economy that characterized the 1950s, the industrial production of the Ruhr reached a level exceeding that achieved under the Nazis. Coal production in 1962 was 114,000,000 tons. Pig-iron production rose to 15,400,000 tons, on the basis partly of low-grade domestic ores and partly of ores imported from Sweden, Canada, Brazil, and elsewhere. Ore from Lorraine by then played a negligible role in the economy of the Ruhr, though the canalization of the Moselle offers possibilities of cheaper importation. Annual steel production increased to about 20,500,000 tons. Deprived of former markets in eastern

Europe, the Ruhr's industrialists turned increasingly to other parts of the world. By the 1960s the Ruhr firms were making a massive contribution to the expansion of plant facilities and the creation of new industries in the underdeveloped countries.

Waterborne communications depend on the Rhine and lower Ruhr rivers and the Rhine-Herne and Dortmund-Ems canals, with Ruhrort (*q.v.*) as the chief port. The Ruhr has one of the densest railway networks in Europe. The Ruhrschnellweg, a 96-ft. highway (1929) between Duisburg and Dortmund, was relieved of congestion by the Berlin–Cologne *Autobahn* of the 1930s, which skirts the Ruhr to the north and west. Further relief was afforded early in the 1960s by the completion of the branch *Autobahn* northeastward from Cologne past Remscheid, Wuppertal, Hagen, Dortmund, and Unna. The heliport at Dortmund is used by local services; international air services use the Düsseldorf airport.

RUHRORT, after 1905 a part of Duisburg (*q.v.*) located in the *Land* (state) of North Rhine-Westphalia (Nordrhein-Westfalen), Federal Republic of Germany. Situated at the confluence of the Ruhr and Rhine, it has one of the largest river harbours in the world and is the principal shipping port for the coal of the Westphalian coalfield and for imported iron ore. The chief industry is iron smelting and steel making. (N. J. G. P.)

RUISDAEL (RUYSDAEL, RUIJSDAEL), **JACOB VAN** (*c.* 1629–1682), Holland's greatest landscape painter, was born at Haarlem about 1629. He was probably the pupil of his father, the frame maker Izack de Gooyer, who later styled himself Ruysdael. There is no truth in the statement that his uncle Salomon van Ruysdael (*q.v.*) influenced his artistic development, let alone was his teacher. The influence of Cornelisz Vroom, another Haarlem landscapist, is often noticeable in his early works of the 1640s; the earliest dated pictures are of 1646. Two years later he became a member of the Guild of St. Luke in Haarlem. Around 1650–52 he traveled extensively in Holland and the neighbouring parts of western Germany (several views of the castle of Bentheim). About 1655 he settled in Amsterdam, of which he became a free citizen in 1659. Meindert Hobbema must have been his pupil before 1660. Ruisdael's name was entered on the list of Amsterdam doctors in 1676, but later his name was deleted. Whether he ever practised as a doctor is not known, but his artistic work was relatively well rewarded. He died in Amsterdam but was buried in Haarlem on March 14, 1682 (the Jacob van Ruisdael who died in 1681 in the almshouse of Haarlem was another painter, the son of Salomon).

"MILL AT WIJK NEAR DUURSTEDE" BY JACOB VAN RUISDAEL. IN THE RIJKSMUSEUM, AMSTERDAM

The early works of Ruisdael, mostly with motifs from the surroundings of Haarlem, are very accurately drawn and executed. Around 1650 his art developed toward a heroic-pathetic style of well-composed romantic landscapes. Unlike most of the Dutch landscape painters, he did not care for a topographical rendering of special scenes. As few of his pictures are dated after 1655, it is hard to place them in exact chronological order. It seems that the many "Waterfalls," varying a theme by A. van Everdingen (who had been in Sweden), belong to his later period, as do the few townscapes which exist. His main motifs are derived from forest scenery ("The Pool in the Wood," Leningrad). Beaches and stormy seas with magnificent clouds had never been painted before with such a power of expression, feeling for atmosphere and space.

The works of Ruisdael are spread over all the great galleries, the National gallery, London, possessing many good examples. His famous paintings also include: "The Jewish Burial Ground" (Dresden and Detroit), based on drawings made at Ouderkerk near Amsterdam; the "View of Haarlem" (Rijksmuseum, Amsterdam); "The Pool" (Berlin and Worcester college, Oxford); "The Wood" (Kunsthistorisches museum, Vienna); two "Views of Egmond" (Philips collection, Eindhoven, and Art gallery, Glasgow); "Wheatfields" (Metropolitan museum, New York); "Mill at Wijk Near Duurstede" (Rijksmuseum, Amsterdam); "The Winter" (Staedel, Frankfurt); "The Burst of Sunshine" ("Le Coup du Soleil," Louvre, Paris). Sometimes, but by no means always, the small figures in his pictures are added by other artists, such as A. Van de Velde, Philips Wouwerman and Nicolaes Berchem.

As can be seen from the subjects, Ruisdael's landscape vision had a wide range. His understanding for the beauty and inner life of the landscape is nowhere hampered by the fact that his poetic and romantic vision transformed the simple Dutch scenery sometimes into unnaturalistic but powerful compositions. Moreover, the rendering of the details—the trees, the water and the ground—is full of careful, sensitive observation. There are several fish markets in white, black and grayish colours, and there is a surprising church interior of the Nieuwe Kerk at Amsterdam (marquess of Bute collection; drawing in Print room, Berlin).

RUIZ, JUAN (*c.* 1283–*c.* 1350), Spanish poet, archpriest of Hita. He is thought to have been born at Alcalá de Henares, though the exact year is unknown. He died about 1350. One of the greatest of Spanish poets, his barefaced, jocund, and yet somewhat moralizing view of life left a profound, still traceable, mark on Castilian literature. His masterpiece, the *Libro de buen amor* (1330, expanded in 1343), was created as something of everyone for everyone, and he seems deliberately to have left it an open book, so that whoever cared to do so might add something further. Three 14th-century manuscripts of the work are extant. The general theme is the relationship between Christian and Moorish concepts as they subsist side by side. Américo Castro compares the work with the erotic poetry of Ibn Hazm, the Cordovan author of the *Tawq al-hamamaw* (1022; *see* COURTLY LOVE). Rafael Lapesa sees it as a characteristic Mudejar work, embodying a profound understanding of Muslim life. Juan Ruiz has adapted elements from the *Ars Amatoria* of Ovid, and, even more clearly, from the 12th-century Latin comedy *Pamphilus*. The influence of the goliardic bards is also apparent, though Juan Ruiz condemns the vice of alcohol. The battle in his book between Don Carnal and Doña Cuaresma has been related to the medieval French poem *La bataille de Caresme et de Carnage*, though it is most likely that both works are based on a common and traditional theme.

The *Libro de buen amor* is rich in language and concept, highly amusing, cynical, and most substantial fare. Its realism is stark and severe and no room is allowed for abstract concepts. The use of popular refrains and figures of speech, a practice which was to yield much that is best in Castilian literature, began with the archpriest of Hita; and his character Trotaconventos is the great antecedent of La Celestina (*q.v.*).

See A. Castro, *España en su historia* (1948); R. Lapesa, "Arcipreste

de Hita" in *Diccionario de literatura española* (1949). (C.-J. Ce.)

RUIZ DE ALARCÓN (Y MENDOZA), JUAN (*c.* 1581–1639), greatest Mexican writer of the colonial era and principal dramatist of early 17th-century Spain after Lope de Vega and Tirso de Molina, was born at Mexico City and educated there and, after 1600, at Salamanca, Spain. Having returned home in 1608 to practise law, he re-emigrated definitively to Spain in 1613 and began to write. A spinal deformity savagely ridiculed by his literary contemporaries isolated him from society and was thus perhaps as responsible as his colonial origin for the atypical character of his work, with its formal polish (with 20 published plays, he is the least prolific major Spanish dramatist) and ethical bias. His finest works are *La verdad sospechosa* (adapted by Corneille as *Le menteur*) and *Las paredes oyen.* He died at Madrid on Aug. 4, 1639.

RULES OF ORDER, as the term is ordinarily used in the United States, embodies the generally accepted rules, precedents and practices commonly employed in the government of deliberative assemblies. Its function is to maintain decorum, ascertain the will of the majority, preserve the rights of the minority and facilitate the orderly and harmonious transaction of the business of the assembly. While it had its origin in the early British parliaments, the modern system of general parliamentary law is, in many respects, at wide variance with the current systems of procedure of both the English parliament and the U.S. congress. These legislative systems are designed for bicameral bodies, generally with paid memberships, meeting in continuous session, requiring a majority for a quorum and delegating their duties largely to committees. Their special requirements and the constantly increasing pressure of their business have produced highly complex and remarkably efficient systems peculiar to their respective bodies but which are as a whole unsuited to the needs of the ordinary assembly. (*See* Congress, United States; Parliament.) As a result there has been simultaneously developed through years of experiment and practice a simpler system of procedure adapted to the needs of deliberative assemblies generally and which, though variously interpreted in minor details by different writers, is now in the main standardized and authoritatively established.

Organization.—Assemblies convene with the implied understanding that they will be conducted and governed in accordance with these fundamental principles. The routine ordinarily followed in the preliminary organization of an assembly includes the call to order by any of those present with a request for nominations for temporary chairman. The temporary chairman having been elected and having taken the chair, a temporary secretary is chosen and those addressing the chairman are recognized to explain and discuss the purposes of the meeting. If the assembly has convened for a single session only or is in the nature of a mass meeting a presiding officer and recording officer will suffice. If permanent organization is contemplated a committee is usually appointed to draft a constitution and bylaws and on the adoption of its report, with or without amendments, the assembly proceeds to the election of the permanent officers thus authorized. In a permanent organization such officers commonly consist of a presiding officer known as the president, chairman, speaker or moderator; a vice-presiding officer; a recording officer, known as the secretary or clerk, who keeps the records, attends to the clerical work of the organization and in the absence of the presiding officers calls for the selection of a temporary president; a treasurer or bursar who receives and disburses its funds; and a sergeant at arms who preserves order and carries out the wishes of the assembly through the presiding officer.

It is the duty of the presiding officer to call the assembly to order at the appointed time, cause the journal or minutes of the preceding meeting to be read, call up the business of the assembly in the order provided by its rules and conduct its proceedings in accordance with parliamentary law. He is especially charged with the responsibility of ascertaining the presence of a quorum, the minimum number of members prescribed by the rules of the assembly as competent to transact business. In legislative assemblies a quorum is presumed to be present unless the question is raised, but where the bylaws of an ordinary assembly require a quorum it devolves upon the presiding officer to ascertain that a quorum is present before proceeding with business.

Motions.—The will of an assembly is determined and expressed by its action on proposals submitted for its consideration in the form of motions or resolutions offered by members recognized for that purpose. In order to make a motion a member must rise and address the chair and secure recognition. If the motion is in order and is seconded by another member it is "stated" by the presiding officer and is then subject to the action of the assembly. A second is not required in legislative assemblies but is requisite under general parliamentary law. Motions may be classified as main or principal motions, introducing a proposition; and secondary or ancillary motions, designed to affect the pending main motion or its consideration. A main motion is in order only when there is no other business before the assembly, and yields in precedence to all other questions. Secondary motions may be subdivided into subsidiary, incidental and privileged.

Subsidiary motions are applicable to other motions for the purpose of modifying the main question or affecting its consideration and disposition. They have precedence of the motion to which applied but yield to privileged and incidental motions. They take precedence among themselves in the following order: to lay on the table; for the previous question; to close or extend debate; to postpone to a day certain; to commit, recommit and refer; to amend; and to postpone indefinitely.

Motion to Lay on the Table.—The motion to lay on the table is in effect a motion to suspend consideration of the question and, if agreed to, also suspends consideration of all pending questions relating to the motion to which applied until such time as the assembly may determine to take it from the table for further consideration. The motion is not debatable and may not be amended, postponed, committed, divided or reconsidered.

Motion for the Previous Question.—The purpose of the motion for the previous question is to close debate peremptorily and bring the assembly to an immediate vote on the pending question. It may be ordered on a single question, a group of questions or any part of a pending question, as on an amendment. It precludes both debate and amendment and requires a two-thirds vote for passage under general parliamentary procedure. It yields to the motion to table, to the question of consideration and to privileged and incidental motions and may be reconsidered, but takes precedence of motions to postpone, amend and commit.

Motion to Close or Extend Debate.—The motion is not admitted in either house of the U.S. congress when not sitting as committee of the whole but is in order under general parliamentary law and insofar as applicable is subject to the rules governing the previous question.

Motion to Postpone to a Day Certain.—This applies to the main motion and its pending amendments and is debatable only as to the advisability of the postponement proposed, and does not open to debate the subject matter of the motion to which applied. It is subject to amendment and reconsideration, to privileged and incidental motions, to motions for the previous question and to lay on the table but has precedence of all other subsidiary motions.

Motion to Commit, Recommit and Refer.—The motions to commit, recommit and refer are practically equivalent and provide for reference of the pending proposition to a committee. While the motion to recommit ordinarily applies to the whole subject including pending amendments, it may apply to certain features only. It may be amended as by adding instructions to the committee as to time and manner of report. Debate on the motion is limited to the question of reference and instructions. It takes precedence of motions to amend and indefinitely postpone but yields to other subsidiary motions and to all incidental and privileged motions. It may be tabled or postponed with the main question but no subsidiary motions except the motions to amend and for the previous question may be applied separately. It is subject to reconsideration at any time before the committee begins consideration of the question submitted to it but after that time

the subject matter may only be reclaimed by a motion to discharge the committee.

Motion to Amend.—Changes in the text or terms of the proposition require a second and must be reduced to writing if requested by the chairman. There is no limit to the number of amendments which may be proposed and new amendments may be offered as rapidly as the pending amendment is disposed of. Amendments in the second degree, that is, amendments to amendments, are admissible but amendments in the third degree, that is amendments to amendments to amendments, are not in order. Only four amendments in the first and second degrees may be pending simultaneously, as follows: (1) amendment; (2) amendment to the amendment; (3) substitute for the amendment (*i.e.*, when it is desired to replace the entire pending amendment); and (4) amendment to the substitute. The amendment must, of course, be offered first and the substitute before the amendment to the substitute, but otherwise there is no rule governing the order in which the four amendments may be presented. They must, however, be voted on in the following order: first, amendments to the amendment; second, amendments to the substitute; third, the substitute; and last. the amendment. Debate on an amendment is in order only when the main motion is debatable, and is then limited to the proposed modification. An amendment which has been rejected may not be offered the second time in identical form, and no amendment may be proposed reversing the operation of an amendment previously adopted. Motions to amend will not be entertained unless germane or relevant to the main question, and no proposition different from that under consideration will be admitted under guise of amendment. This motion yields to all privileged, incidental and subsidiary motions except indefinite postponement. It is subject to amendment, to the operation of the previous question and to reconsideration, and when laid on the table carries with it the proposition proposed to be amended. Likewise, when the main question is laid on the table, postponed or recommitted, all pending amendments accompany it. The motion to amend is not applicable to the motion to lay on the table or for the previous question, to adjourn or to suspend the rules.

Motion to Postpone Indefinitely.—The motion to postpone indefinitely provides for final adverse disposition for the session and amounts to summary rejection. It is debatable and opens to debate the question to which applied but is subject to no subsidiary motion except the motion for the previous question.

Incidental motions include questions arising incidentally in the consideration of other questions and decided before disposition of the one to which they are incident. They have no relative rank and merely take precedence of the pending question in the consideration of which they have arisen. All are undebatable with the exception of appeal. They comprise motions to suspend the rules, withdraw motions, read papers, raise the question of consideration, questions of order and appeal, reconsider, take up out of order, determine method of procedure, divide pending questions and questions relating to nominations.

The motion temporarily to suspend the rules may not be debated or reconsidered and is not subject to the application of any subsidiary motion. The vote required to pass the motion is ordinarily fixed by the rules of the assembly and in the absence of such provision is two-thirds of those present and voting.

Withdrawal or modification of a motion after it has been "stated" by the presiding officer is usually effected by unanimous consent but in event of objection by any member must be submitted to the assembly. Consent of the seconder is not required but if modified the seconder may withdraw the second. When applied to the main motion it includes all adhering motions, but when applied to amendments or adhering motions the main question is not affected. The reading of papers on which a vote is to be taken may be demanded by any member as a matter of right. Papers on which a vote is not required are usually read by unanimous consent but if objection is made the question must be submitted to the assembly.

The question of whether the assembly desires to take up a proposition regularly presented for its consideration may be tested by raising the question of consideration, which may be moved at any time before actual consideration commences and does not require a second. It is not in order after debate begins or after a subsidiary motion has been applied. When the question is properly raised the assembly may by a two-thirds adverse vote decline to take up any business it prefers not to consider.

Points of Order may be made while another has the floor, and when the question concerns the use of unparliamentary language the member so called to order must be seated pending disposition of the matter. The question must be raised at the time the proceeding giving rise to the objection occurs and will not be entertained after the assembly has passed to other business. If the point of order is overruled the member resumes the floor but if the objection is sustained he may proceed only by consent of the assembly. Debate on questions of order is for the information of the chair and may be closed by the presiding officer at any time. Any member may appeal from a decision by the chair and such appeal is debatable unless arising out of an undebatable question.

The motion to reconsider must be made by one who voted with the prevailing side but may be seconded by any member. It is only in order on the day or the next calendar day after the vote proposed to be reconsidered is taken. The motion is of the highest privilege and may be entered for record on the minutes while another has the floor, but cannot be called up for consideration until the pending question is disposed of, when it takes precedence of all new business. If applied to a debatable question it reopens the entire subject to debate. The motion may not be amended, committed or indefinitely postponed and requires a majority vote for passage. If agreed to, the motion reopens the entire question for further action as if there had been no final decision. The motion to take up out of order is merely another form of the motion to suspend the rules and requires a two-thirds vote for enactment. It is not amendable and debate is limited to the specific question presented.

A motion to divide the question is in order where the pending question includes propositions so distinct that, one being taken away, a substantive proposition will remain. Such motions are applicable to main questions and their amendments only and no subsidiary motion except the motion to amend is admitted. The rules of the U.S. house of representatives provide that any member may demand the division of a question as a matter of right, but under general parliamentary procedure the question must be submitted to the vote of the assembly.

Nominations do not require a second. Where the rules of an assembly fail to provide a method of nomination a motion for such provision is in order. The motion to close nominations is subject to none of the subsidiary motions save the motion to amend, and is decided by a two-thirds vote.

Privileged Motions relate to the needs and interests of the assembly and its members in matters of such urgent importance as to supersede temporarily pending business. They take precedence of all other motions and may be offered while other questions are pending. In this class of motions is the motion to fix the time to which to adjourn, to adjourn, to take a recess, raising questions of privilege and the call for the orders of the day, all of which are undebatable.

Other motions variously referred to as supplementary, miscellaneous and unclassified are the motions to take from the table, to discharge a committee, to accept the report of a committee, to rescind, to repeal, to annul, to expunge and to permit a member to resume the floor after having been called to order for words spoken in debate.

Rules for Debate.—In order to debate a question, a member must rise and address the chair and be recognized by the presiding officer for that purpose. The presiding officer should first recognize the mover of a proposition or the member of a committee presenting a report and should endeavour to alternate recognitions between those favouring and those opposing a question. It is also customary, though not necessarily incumbent upon the chair, to permit the proponent of a proposition to close debate. A member may speak but once on the same question at the same stage of the proceedings if others desire recognition, but is entitled to speak

on the main question and on each amendment as presented. Under general parliamentary procedure a member securing the floor may speak without limit and this practice still obtains in the U.S. senate, but the house of representatives by rule limits speakers to one hour in the house and to five minutes in the committee of the whole. Most assemblies and all legislative bodies provide a limit for debate and in conventions it is customary to adopt a rule at the opening session limiting debate to a specified number of minutes. In debate a member must confine himself to the question under consideration, must avoid personalities and must not arraign motives. Members should be silent and respectful while another has the floor and in questioning the speaker should first address the chair, who will in turn inquire if the speaker desires to yield. Where the presiding officer is a member of the assembly he has the right to debate and to participate in the proceedings but should call another to the chair before taking the floor and should not resume it again until the pending question has been decided.

Voting.—Voting may be by ballot; by division, that is a rising vote; viva voce, that is by acclamation, the presiding officer deciding by the volume of voices; by show of hands; by tellers, the members passing between tellers appointed from opposite sides to count them as they pass through; and by yeas and nays, the clerk calling the roll and recording each vote as given. If there is doubt as to the result of a viva voce vote any member may request a division and the presiding officer thereupon proceeds to take a rising vote. A member may change his vote at any time prior to announcement of the result. Only members in attendance may vote and voting by proxy is never permissible unless by operation of law. A tie vote defeats an affirmative motion. The presiding officer, if a member of the assembly, may vote to break a tie or to make one.

Committees.—Much of the work of assemblies and especially of legislative bodies is transacted by committees. The committee system provides for a better division of labour and for a more detailed consideration than the assembly as a whole is ordinarily prepared to give. Committees are classified as standing committees with fixed terms of office and rendering continuous service; and special committees serving temporarily and assigned to limited service. In the absence of a rule making other provision, committees are selected by the assembly. Frequently the chair is authorized to appoint committees. Or selection may be made by ballot, by resolution or by designation in motions of reference. If no chairman is designated the member first named acts as chairman until the committee elects a chairman. As far as applicable the rules of the assembly govern its committees. The chairman of the committee submits its report to the assembly and unless it is of elementary character is required to present it in writing. Members who do not concur in the report may submit minority views over their signatures. When called up for consideration in the assembly such minority report is read in connection with the majority report unless there is objection, in which event the question of reading the minority views is submitted without debate to the vote of the assembly.

The committee of the whole consists of the entire assembly acting as a general committee. In legislative assemblies it affords greater freedom of consideration but in nonlegal bodies is rarely used.

Parliamentary Practice.—Use of motions to effect a purpose in the assembly or its committees when applicable may be summarized as follows: The body may protect itself against business which it does not wish to consider by invoking the motion to lay on the table, by raising the question of consideration or by voting to postpone indefinitely. If it is desired to suppress debate, the motion to limit debate and the demand for the previous question are available. Modification of a proposition may be secured through amendment or reference to a committee with or without instructions. Action may be deferred by postponement to a day certain, by providing a special order or by the motion to table. A question may be brought up a second time for consideration in the assembly by voting to take from the table, by reconsideration or by the motion to rescind, repeal or annul.

See H. M. Robert, *Rules of Order*, rev. ed. (1956). (C. Ca.)

RULES OF THE ROAD AT SEA are internationally agreed upon traffic regulations for ocean waters. They apply to every type of watercraft, including seaplanes. Their purpose is to prevent collisions; this is accomplished by rules specifying the colour, arc and visibility, and arrangement of lights; the size, colour, shape, and position of daymarks; the character, duration, and frequency of sound signals; and the type of avoiding action to be taken when two craft approach each other. Special provisions cover situations involving inability to maneuver, distress, and cases in which three craft approach each other simultaneously. Authority is also provided for countries to have special rules for their own inland waters. In the latter case, the normal practice is for a country to limit differences to additions made necessary by local conditions. The major exception is the United States, which has evolved complex rules for its internal waters that sometimes contradict the ocean regulations.

Radar, which is neither mentioned in the rules nor recognized by cognizant courts as an excuse for deviation from the rules, is considered to be an aid to navigation, which, if properly used, will assist the rules in their purpose.

The history of the modern rules dates back to 1863, when nations first took into account the effect of steam on shipping. The rules have since undergone periodic revision because of advances in technology and of such new developments as seaplanes and the increase in pleasure craft. Texts of the rules normally can be obtained from the governmental agency administering shipping and/or boating in a particular country. The following is a summary of the regulations that came into force on Jan. 1, 1954, based on recommendations of the International Conference on Safety of Life at Sea, 1948. An international conference held in 1960 resulted in further recommended changes to the rules. However, by the mid-1960s they had not been put into effect because a sufficient number of nations had not ratified them.

Preliminary and Definitions.—The regulations apply to all vessels on the high seas. A "power-driven" vessel is any vessel propelled by machinery. When under sail only, a power-driven vessel is considered a sailing vessel; if under both sail and power, it is considered a power-driven vessel. The rules for seaplanes apply when the planes are waterborne, and are similar to the rules for power-driven vessels. Any vessel is under way when not at anchor, moored, or aground.

Lights and Shapes.—The rules concerning lights must be complied with in all weathers from sunset to sunrise. No other lights which might be mistaken for the prescribed lights, impair their visibility, or interfere with the keeping of a proper lookout must be exhibited. Shapes of daymarks shall be not less than two feet in diameter.

Power-Driven Vessels Under Way.—(1) Masthead light: in the fore part of the vessel a white light visible for five miles over an arc of 225°, *i.e.*, from right ahead to 22½° abaft the beam on either side, must be displayed. (2) Range light: a second white light of similar character shall be exhibited either forward or abaft the above light (not compulsory for vessels less than 150 ft. in length or when towing). These two lights must be in line with the keel, one 15 ft. higher than the other. The horizontal distance between them must be at least three times the vertical distance. The lower light shall not be less than 20 ft. above the hull. (3) Side lights: (*a*) on the starboard side a green light clearly visible for two miles over an arc of 112½°, *i.e.*, from right ahead to 22½° abaft the beam, must be shown; (*b*) on the port side a similar red light must be displayed. These side lights must be fitted with screens projecting 3 ft. forward of the light. (4) Stern light: (*a*) vessels under way shall carry at their stern a white light visible for two miles over an arc of 135°, *i.e.*, from right astern to 67½° on each side; (*b*) small vessels unable to carry this light must have ready an electric torch or lighted lantern to show to an overtaking vessel.

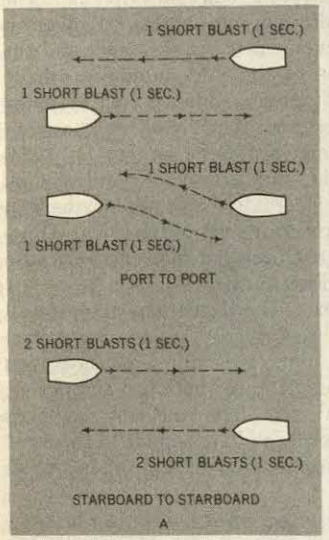
Towing Lights.—(1) A power-driven vessel towing or pushing another vessel shall carry in addition to her side lights two white masthead lights vertically, not less than six feet apart; (2) if the tow consists of two or more and exceeds 600 ft. an additional white light must be carried six feet above or below such lights;

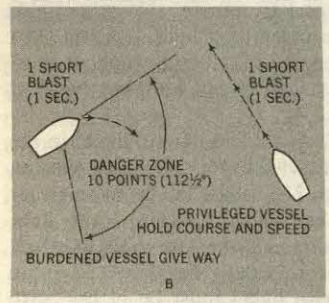
(3) a stern light or a white light must be shown abaft the funnel or aftermast for the tow to steer by.

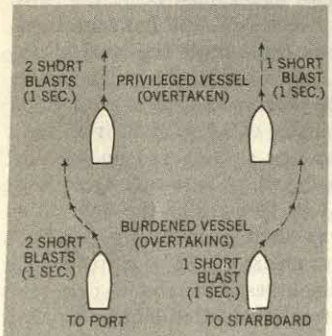
Not Under Control.—(1) A vessel not under command shall carry in lieu of masthead and range lights, where best seen, two red lights vertically, not less than six feet apart and visible all around for two miles. By day, the red lights shall be replaced by two black balls. (2) A vessel working submarine cables, navigation marks, surveying, or on underwater operations and unable to maneuver shall carry in lieu of masthead and range lights three lights vertically six feet apart, thus—red, white, red—visible all around for two miles. By day, similarly placed, she shall carry three shapes vertically, the highest and lowest globular in shape and red in colour, the middle diamond in shape and white. (3) Both types shall carry side lights and a stern light when in motion and shall turn off the side lights when stopped.

Sailing vessels under way and vessels towed shall carry the same lights as prescribed for a power-driven vessel except for masthead and range lights. *Small vessels unable to fix the side lights* must have them ready for immediate display on nearing another vessel.

Power-driven vessels of less than 40 tons and *sailing vessels of less than 20 tons* are authorized to carry under way lights of reduced visibility at less height and less separation. *Small rowing boats* are only required to exhibit a white light in time to avoid collision.







FROM M. WEEKS (ED.), "THE COMPLETE BOATING ENCYCLOPEDIA"

FIG. 1.—RIGHT-OF-WAY RULES APPLIED TO POWER-DRIVEN VESSELS: (A) PASSING PROCEDURE; (B) CROSSING; (C) OVERTAKING

Pilot Vessels.—(1) Sailing pilot vessels under way on station shall carry a white all-around light at the masthead visible for three miles and exhibit a flare-up light at intervals not exceeding ten minutes, and also show their side lights on the approach of or to other vessels. (2) Power-driven vessels under way on station shall carry the above light and flare and also, eight feet below the white masthead light, a red light visible all around for three miles, and side lights. (3) When at anchor on station, pilot vessels will exhibit the above lights and anchor lights, but not side lights. (4) When not on station, they shall carry the same lights as other vessels of their class and tonnage.

Anchor Lights and Shapes.—(1) Vessels less than 150 ft. in length shall carry forward a white light showing all around for two miles. (2) If 150 ft. or more, the above light must be not less than 20 ft. above the hull; and at the stern, at least 15 ft. lower than the forward light, another such light must be shown, both to be visible all around for three miles. (3) Between sunrise and sunset every vessel at anchor shall carry forward one black ball. (4) Working submarine cables, navigation marks, surveying, or on underwater operations, a vessel at anchor shall carry the red-white-red lights and shapes previously described for such vessels and also shall carry anchor lights.

Vessels aground shall carry by night anchor lights and the two red lights prescribed for a vessel not under command; by day three black balls, vertically not less than six feet apart.

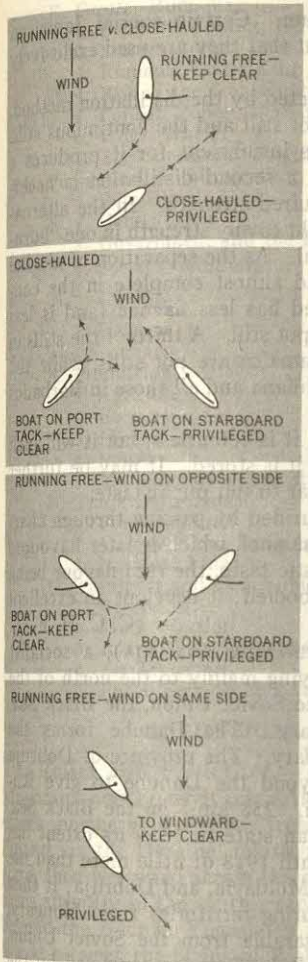
Vessels Fishing.—Only the prescribed lights and shapes must be shown, visible for two miles: (1) (*a*) With nets or lines (not trolling) extending less than 500 ft. into the seaway, an all-around white light, and on the approach of or to another vessel, another white light six feet below it and at least ten feet horizontally from it in the direction of the gear. By day, a basket, which must, if at anchor, be shown in the direction from the anchor ball toward the gear. (*b*) If the gear extends more than 500 ft., three white lights in a vertical triangle, three feet apart, visible all around, also side lights when making way through the water. By day, a basket close to the bow not less than ten feet above the rail; also, conspicuously, one black conical shape, apex upward. At anchor with gear out the basket must be in the direction from the anchor ball toward the gear. (2) (*a*) A power-driven vessel trawling shall carry in lieu of the masthead light, a tricoloured lantern showing a white light from right ahead to 22½° on each bow, and green and red lights showing from 22½° on each bow to 22½° abaft the beam on the starboard and port sides respectively, and not less than 6 nor more than 12 ft. below the lantern a white all-around light and also a stern light; (*b*) sailing vessels trawling shall carry a white light showing all around and on approach of or to another vessel show a white flare-up light; (*c*) by day, vessels trawling shall display a basket in a conspicuous position. (3) Vessels fishing may in addition to the above lights show a flare-up light in order to attract attention, and use working lights. (4) Vessels 1(*a*) and 1(*b*) fishing at anchor shall show anchor lights and an additional white light six feet below the forward anchor light and ten feet horizontally from it, in the direction of the gear. (5) (*a*) If a vessel when fishing becomes fast by her gear to an obstruction, she shall in daytime haul down the basket and show the shape required for a vessel at anchor; by night she shall show anchor lights; (*b*) in bad visibility whether by day or night the signal for a vessel not under control must be sounded, which signal shall also be used on the approach of another vessel in good visibility.

Special Lights and Signals.—(1) Vessels may, to attract attention, show a flare-up light or use sound signals which cannot be mistaken for any signal authorized elsewhere. (2) Ships of war, convoys, and merchant ships may operate station or signal lights or recognition signals adopted by shipowners, duly authorized by their respective governments.

Vessels under sail and power in daytime shall display one black conical shape, point upward, carried forward.

Fog Signals.—A "short blast" means one of one second; a "prolonged blast," one of four to six seconds. Signals prescribed shall be given by power-driven vessels on the whistle; sailing vessels, on the fog horn; vessels towed, on the whistle or fog horn.

In fog and restricted visibility, by day or night, the following signals shall be used (the time intervals indicated are the maximum permitted): (1) (*a*) A power-driven vessel making way must sound a prolonged blast every two minutes. (*b*) A power-driven vessel stopped and not making way must sound every two minutes two prolonged blasts with one second between. (2) Every minute a sailing vessel under way must sound on the starboard tack one blast; on the port tack, two blasts; and when the wind is abaft the beam, three blasts. (3) (*a*) A vessel anchored shall ring her bell rapidly for five seconds every minute. (*b*) If more than 350 ft. in length the vessel must sound the bell forward, and sound a gong or similar instrument aft. (*c*) Both may sound to approaching vessels, one short, one prolonged, and one short blast in succession. (4) A vessel towing or unable to maneuver must sound one prolonged and two short blasts in succession every minute. (5) The last vessel of a manned tow shall sound one prolonged and three short blasts in succession after the towing vessels signal. (6) A vessel aground must sound three separate strokes on the bell immediately before and after ringing the bell and gong as prescribed in (3). (7) Vessels of less than 20 tons and rowing boats must sound an efficient sound signal every minute. (8) Vessels fishing, of 20 tons upward, must sound a blast followed by



FROM M. WEEKS (ED.), "THE COMPLETE BOATING ENCYCLOPEDIA"

FIG. 2.—RIGHT-OF-WAY RULES APPLIED TO SAILING VESSELS

ringing the bell or a blast of several alternate notes every minute.

Speed in Fog.—(1) Every vessel shall in conditions of restricted visibility go at a moderate speed. (2) A power-driven vessel hearing, apparently forward of her beam, the fog signal of a vessel the position of which is not ascertained, shall, circumstances permitting, stop her engines and then navigate with caution until danger of collision is over.

Steering and Sailing Rules.—*Sailing vessels* approaching one another with risk of collision shall take action as follows: (1) A vessel running free shall keep out of the way of the vessel close-hauled. (2) A vessel close-hauled on the port tack shall give way to the vessel close-hauled on the starboard tack. (3) When both are running free with the wind on different sides, the vessel with the wind on the port side shall keep clear of the other. (4) When both are running free with the wind on the same side, the vessel to windward shall keep clear of the one to leeward. (5) The vessel with the wind aft shall keep clear of the other vessel.

Power-Driven Vessels.—(1) When meeting end on or nearly end on with risk of collision, each shall alter course to starboard so that they pass port to port. This applies only to cases when by day each vessel sees the masts of the other in a line or nearly so with her own and when by night each vessel is in such a position as to see both the side lights of the other. (2) When two power-driven vessels are crossing so as to involve risk of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other.

Power-Driven and Sailing Vessels.—When risk of collision is involved the power-driven vessel shall keep out of the way of the sailing vessel.

General.—(1) Where by these rules one of two vessels is to keep out of the way of the other, the other shall keep her course and speed. When from any cause the latter vessel finds herself so close that collision cannot be avoided by the action of the giving-way vessel alone, she also shall take action as will best aid to avert collision. (2) Every vessel which is directed by these rules to keep out of the way of another vessel shall, if the circumstances of the case admit, avoid crossing ahead of the other. (3) Every power-driven vessel shall, on approaching another vessel which she is directed by these rules to keep clear of, if necessary, slacken her speed, stop, or reverse.

Vessels overtaking shall keep out of the way of the overtaken vessel. An overtaking vessel is one coming up with another from any direction more than 22½° abaft her beam, *i.e.*, a position from which by night she would be unable to see the side lights of the vessel she is overtaking; no subsequent alteration of the bearing between them shall make the overtaking vessel a crossing vessel within the meaning of these rules or relieve her of the duty of keeping clear until she is finally past and clear. If the overtaking vessel is doubtful whether she is forward or abaft this direction from the other vessel, she shall assume that she is an overtaking vessel and keep clear.

Narrow Channels.—(1) Every power-driven vessel proceeding along the course of the channel shall, when it is safe and practicable, keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel. (2) A power-driven vessel nearing a bend in a channel when another vessel approaching from the other direction cannot be seen shall give a prolonged blast when within one-half mile of the bend, which signal shall be answered by a similar blast by any approaching power-driven vessel within hearing around the bend. The bend shall be rounded with alertness and caution.

All vessels not engaged in fishing shall keep out of the way of vessels fishing.

Navigational Dangers and Proper Precautions.—A vessel may depart from the rules to avoid immediate danger, but only to the extent necessary. Every vessel shall take the precautions required by the circumstances.

Sound Signals for Vessels in Sight of One Another.—(1) When vessels are in sight of one another, a power-driven vessel, in taking any course authorized or required by these rules, shall indicate that course by the following signals: one short blast to mean "I am altering my course to starboard"; two short blasts, "I am altering my course to port"; three short blasts, "My engines are going astern." (2) A hold-course power-driven vessel that doubts the keep-clear vessel is taking sufficient action to avert collision may indicate such doubt by giving at least five short and rapid blasts on the whistle, but this does not relieve her of any obligations under these rules or of her duty to indicate any action taken by appropriate sound signals laid down under (1).

Distress Signals.—Vessels in distress and requiring assistance from other vessels or the shore shall use or display the following signals either together or separately: (1) a gun or other explosion signal fired at intervals of about a minute; (2) a continuous sounding with any fog-signal apparatus; (3) rockets or shells throwing red stars fired one at a time at short intervals; (4) a signal made by radiotelegraphy or by any other signaling method consisting of the group SOS in the Morse code; (5) a signal sent by radiotelephony consisting of the spoken word "Mayday"; (6) the international code signal of distress NC; (7) a square flag having above or below it a ball or anything resembling a ball; (8) flames on the vessel (as from a burning tar barrel, etc.); (9) a rocket parachute flare showing a red light.

To secure attention, vessels in distress may actuate auto alarms of other vessels by a radio signal of a series of 12 four-second dashes.

RULHIÈRE, CLAUDE CARLOMAN DE (1734–1791), French writer, historian of Poland, was born in Bondy, Seine, June 12, 1734. In 1762, as secretary to the French ambassador at St. Petersburg, he witnessed the revolution—described in his *Anecdotes sur la révolution de Russie*—which put Catherine II on the throne. His manuscript was circulated until published, on Catherine's death, in 1797. Abandoning diplomacy in 1765, he began, in 1768, his *Histoire de l'anarchie de Pologne*, written for the young dauphin's instruction. Talleyrand called it "a manifesto in favour of liberty"; though never completed, it was published in 1807. Rulhière became the future Louis XVIII's secretary in 1772, was elected to the Académie Française (1787), and wrote—at the government's request—*Éclaircissements Historiques sur les causes de la révocation de l'édit de Nantes* (1788), justifying the restoration of Protestants' civil rights. He was also an accomplished writer of light verse. He died in Paris, Jan. 30, 1791.

See A. Chevalier, *Claude-Carloman de Rulhière* (1939).

RULLUS, PUBLIUS SERVILIUS, a Roman tribune of the people in 63 B.C., who, on entering office in December 64, proposed an agrarian law for the establishment of a commission of ten, empowered to buy land in Italy for distribution among the poorer citizens and for the foundation of colonies. Pompey, then in the east, was excluded from the commission by a provision that personal attendance was necessary to election. There

were provisions for the purchase of further land by the sale of recently conquered territory and the use of the revenues from Pompey's provinces. The places to which colonies were to be sent were not specified, so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property. Cicero delivered four speeches against the bill, of which three are extant. It was not greeted with enthusiasm and was dropped before the voting. The whole affair was obviously a political move, probably engineered by M. Licinius Crassus and Caesar (*qq.v.*) with the object of gaining a "corner" in land which Pompey would need for his veterans after his return. Even if the promoters of the bill hardly expected it to pass, the *optimates* (senatorial aristocracy) would be saddled with the odium of rejecting a popular measure. In some respects the bill anticipated Caesar's agrarian legislation of 59 B.C.

See E. G. Hardy, *Some Problems in Roman History* (1924).

RUM (ROUM), a term in use among Muslims at different dates for Europeans generally and for the Byzantine Empire in particular; hence also Rumelia (*q.v.*).

When the Arabs met the Byzantine Greeks, the latter, being the heirs of the Roman Empire, called themselves *Romaioi* (Romans); so that the Arabs called the people "the Rum" (*see* Koran xxx), their territory "the land of the Rum," and the Mediterranean "the sea of the Rum." "Rum" is also the name given by the Arabs to the Greek Orthodox Patriarchate of Jerusalem.

The sultanate of Rum in Asia Minor, with capital at Konya (*q.v.;* Iconium), was a kingdom carved out of Byzantine territory by the Seljuk Turks during the 11th–13th centuries (*see* SELJUKS).

RUM is a spirit obtained by distillation of the fermented products of sugarcane. Although it is produced in most sugar-growing countries of the world (United States, Cuba, Australia and South Africa) for local consumption, the world demand for rum is mainly supplied by the West Indies, where it originated. Types of rum are legion, for they depend upon the quality of the ingredients, upon methods of fermentation and distillation and upon subsequent treatment and maturation.

The manufacture of rum was developed in the British West Indies in the 17th century, soon after the settlement of the islands. After Columbus had discovered Cuba in 1492 the Spaniards introduced sugarcane there, whence it spread to the other West Indian islands; the sugar industry has been paramount ever since. In Barbados, rum was certainly produced as early as 1647, 23 years after the island's settlement, and probably earlier. At first it was known as "kill-devil"; three years later it was referred to as "rumbullion" and by 1667 it was called simply rum.

Rum is made out of either pure cane sugar or, more frequently, molasses. The main territories that produce rum for export are Barbados, Trinidad, Jamaica and British Guiana; Puerto Rico and Cuba also export considerable quantities. Most of the other West Indian islands produce rum in small quantities. Where the sugar industry is undeveloped, pure sugarcane juice is used rather than molasses. Rum can be made, however (as in the United States and Germany), from imported molasses.

Molasses (*q.v.*), the commonest ingredient for fermentation, is the treacly residue left after sugar has been crystallized from sugarcane juice; sometimes skimmings from the purer cane juice are also added. Fermentation can be of either the Demerara or the Jamaican type. In the Demerara method either sugarcane or molasses is prepared into a liquid known as the "wash," and diluted to a low specific gravity (1.060); usually a little sulfuric acid is added to assist the saccharomyces, or alcohol yeasts, and sometimes also a small quantity of ammonium sulfate, as food for the yeast. The fermentation thus encouraged is completed in 48 hours. This method produces a high alcohol yield but a low ester content; thus the spirit is comparatively lacking in bouquet, although it is sometimes subsequently flavoured.

In the Jamaican method, the fermentation lasts for about 10 or 12 days with a wash of between 1.078 and 1.096 specific gravity. Apart from introducing into the wash some of the waste, known as dunder, from a previous distillation, no special encouragement is given to the alcohol yeasts; it is thus possible for esters to develop more easily and this is one of the origins of the distinctive flavour possessed by Jamaican rum. Certain special Jamaican rums have such a high ester content that they are used exclusively for blending.

The flavour of a rum also is affected by the distillation method. Two methods are available: the pot still and the continuous still. In the first, a single distillation is insufficient for it produces a spirit too weak for consumption; a second distillation is necessary to bring the spirit to the required strength. In the alternative method the spirit can be brought to any strength in one "burning"; it is thus far more economical. As the separation of alcohol from water can be very quick and almost complete in the continuous still, the spirit so produced has less flavour (and is less heavy) than that produced by the pot still. A third of the stills in British Guiana and all those in Jamaica are pot stills, while the remainder of the stills in British Guiana and all those in Barbados and Trinidad are continuous.

After the rum has been distilled it is colourless, but it will pick up colour from the casks in which it is stored. It may be further coloured with caramel or burnt sugar to suit public taste.

In Cuba the distilled spirit is purified by passing through charcoal so as to obtain a flavourless alcohol, which is later flavoured independently; it has a characteristic taste, the rum flavour being weak. U.S. rum is mostly heavy bodied; it develops an excellent aroma when aged. (C. C. H. F.)

RUMANIA (REPUBLICA SOCIALISTĂ ROMÂNIA), a socialist republic of southeastern Europe, lying mainly to the north of the Danube River and bordered by the Soviet Union, the Black Sea, Bulgaria, Yugoslavia, and Hungary. The Danube forms the greater part of the southern boundary. The province of Dobruja (Dobrogea) extends eastward beyond the Danube to give Rumania a frontage of about 160 mi. (258 km.) on the Black Sea. Since the creation of the Rumanian state in 1859 its extent has fluctuated greatly. It consisted until 1918 of little more than the provinces of Walachia (Valahia), Moldavia, and Dobruja; it then gained Transylvania and neighbouring territories from Hungary, Bukovina from Austria, and Bessarabia from the Soviet Union. In 1940 Bessarabia and northern Bukovina were annexed by the Soviet Union, and southern Dobruja was ceded to Bulgaria. The present area of Rumania is 91,699 sq.mi. (237,500 sq.km.) and its population, according to the 1963 estimate, 18,813,131. The capital is Bucharest (București).

I. PHYSICAL GEOGRAPHY

1. Relief and Structure.—The great arc of the Carpathian Mountains and Transylvanian Alps, a branch of the Alpine system, enters northern Rumania from Czechoslovakia and southern Poland via the Ukraine, taking a curving course, first southeastward, then westward across the central part of Rumania. It then turns abruptly to the south, reaches the Danube, and is continued beyond the river in Yugoslavia and Bulgaria. It forms a major divide between the plains of Walachia, Dobruja, and Moldavia to the south, southeast, and east, and the Transylvanian Basin to the northwest of the mountain arc.

The Carpathian Mountains and the Transylvanian Alps (*qq.v.*).—These were folded during the Alpine mountain-building process in early Tertiary times by pressures exerted from the south and west against the resistant platforms, which now comprise southern Russia and the plains of the lower Danube Valley. The mountains, composed mainly of limestones, sandstones, and shales, have been eroded into a series of longitudinal ranges, lying parallel to the general direction of the ranges themselves. In the course of the mountain building process, the beds were intruded by igneous rocks at many places. These are especially numerous and extensive in the more westerly parts of the Transylvanian Alps, where the areas of most rugged relief are formed in granite.

After their formation, the mountains were subjected to extensive faulting and accompanying volcanic action. The northern part of the Rumanian Carpathians is dotted with the craters of former volcanoes and is covered with volcanic ash, lava, and other extrusive deposits. The average height of the Carpathian-Transylvanian chain is about 3,300 ft. (1,006 m.). The two highest mountains in Rumania are Moldoveanu, 8,343 ft. (2,543 m.), and Negoiu, 8,317 ft. (2,535 m.). Although there is abundant evidence of former glacial action in the ranges of the Munţii Bucegi, Făgăraşului, Parîngului, and Retezatului in the Transylvanian Alps, there are today no permanent snowfields.

The Plains of Walachia, Moldavia, and Dobruja.—The low rolling hills of this area resemble the plains of southern Russia. Walachia, lying between the Transylvanian Alps and the Danube, is a region of gentle relief which drops gradually from the mountains to the river. It is thickly covered by the Tertiary and Recent deposits, though deeply buried beneath the present surface is the stable Paleozoic massif against which the yielding beds were in part forced to build up the present mountains. Moldavia is fundamentally similar, though its altitude is somewhat greater and it has been dissected by southward flowing rivers into a maze of rounded hills. Dobruja, enclosed on west and north by the Danube and its delta, and on the east by the Black Sea, is different from the last two regions. It is part of the hidden massif which extends beneath the lower Danube and Soviet Ukraine. Its Paleozoic rocks show through at the surface, though covered in part by Cretaceous and Tertiary deposits and also by Quaternary and Recent deposits of loess and alluvium.

The Transylvanian Basin.—The segment of Rumania that is enclosed within the curve of the Carpathian Mountains is in all respects more complex. Within the arc of the mountains is the Transylvanian Basin. In late Tertiary times it constituted a lake basin in which were deposited clays, sands, and some limestones. The basin has since been drained, and with the uplift of the region rivers have cut their valleys into its surface. It is today a hilly region, in which the soft rocks yield deep and generally fertile soils, and the surrounding mountains give it some protection from the harshness of the east European climate.

PRINCIPAL PHYSICAL FEATURES, CITIES, AND REGIONS OF RUMANIA

(LEFT) EASTFOTO; (RIGHT) CHIC DONCHIN—PIX FROM PUBLIX

(LEFT) THE OLT RIVER IN THE COZIA DEFILE BETWEEN THE COZIA AND NAURUŢU MOUNTAINS. THE VILLAS OF THE CĂLIMĂNEŞTI SPA CAN BE SEEN ON THE RIGHT BANK; (RIGHT) EASTERN ORTHODOX TYPE CHURCH IN THE CENTRE OF THE TOWN OF TIMIŞOARA

Rumania. In the opposite direction, the Mureşul (Mureş) separates the Munţii Bihorului from the Munţii Poiana Ruscă, as the Timişul (Timis) does the Poiana Ruscă from the Semenicului (Seminic Mountains). These latter are structurally part of the western Transylvanian Alps, from which they are separated only by recently eroded river valleys.

Extension of the Hungarian Plain.—To the west of this series of massifs lies a plain from 20 to 60 mi. (32 to 97 km.) in width, which extends along the western border of the country from the Soviet boundary in the north to that of Yugoslavia in the south. It is part of the Hungarian Plain, and, like the Walachian Plain, it is low-lying and undulating, and its deep-seated ancient rocks are thickly buried by Tertiary and Recent deposits.

Drainage.—Most of the land surface is drained to the Danube River, and only in Dobruja are there a few short rivers which flow direct to the Black Sea. Walachia is traversed by a large number of rivers which rise in the Transylvanian Alps and flow south to the Danube. The largest of these, the Olt (Oltul), rises to the north of the mountains which it crosses by a highly picturesque gorge. Moldavia and the eastern flanks of the Carpathian Mountains are drained by the Siretul (Siret) and Prut (Prutul) rivers and their tributaries.

These rivers join the Danube near the head of its delta. The Danube delta is the most extensive in Europe. It is a vast area of about 1,000 sq.mi. (2,590 sq.km.) of lagoon, swamp, and damp pasture, traversed by branches of the Danube on their way to the Black Sea. The inner or west-facing slopes of the Carpathians, together with the Transylvanian Basin and Bihor Mountains, are mainly drained westward to the Hungarian Plain, by the Mureşul and Someşul. Beyond the boundary of Rumania, they are gathered to the Tisza or the Danube.

2. Climate.—Rumania experiences a continental climate with hot summers, moderated by altitude in the mountains, and long and severe winters. The south wind of summer (*austru*) brings hot and oppressive conditions and in winter the wind from the northeast (*crivat*) imparts to the Rumanian countryside all the severity of the Russian steppe, except where mountains give some protection.

The incidence of rainfall in particular is influenced by relief. Rainfall is heaviest in the mountains, especially on the west-facing slopes of the northern Carpathians, the Bihor Mountains, and the western parts of the Transylvanian Alps. There the annual average is generally more than 31 in. (79 cm.) and rises to over 55 in. (140 cm.). In the drier eastern Carpathians it is consistently over 28 in.

By contrast, the margin of the Hungarian Plain, the Transylvanian Basin, and the plains of Walachia, Moldavia, and Dobruja are dry, with an annual average rainfall everywhere of less than 28 in.

The influence of relief on temperature is no less marked. In July, the hottest month, temperatures in the mountains average 61° F (16° C) or less, in the plains of Walachia and southern Moldavia more than 71° (22°), and along the Danube Valley and on the border of the Hungarian Plain, over 73° (23°). In January the whole country, with the exception only of the part of the Dobruja close to the Bulgarian border, has an average temperature of below freezing. In the mountains the average drops to 16° F (−9° C), and in both the mountains and the plains extremes as low as −22° F (−30° C) have been widely recorded.

3. Vegetation.—The vegetation of Rumania varies with altitude. Forest covers about 27% of the country, mostly in the area above 1,000 ft. The hills and lower mountain slopes have a plant association dominated by oak. The beech forests extend up to 4,250 ft. (about 1,300 m.) and above this are forests of principally fir and spruce. Above about 5,900 ft. (1,800 m.) are summer pastures and alpine vegetation.

Most of the plains and much of the Transylvanian Basin are under cultivation, and the original vegetation, generally open woodland, has been destroyed. Patches of deciduous woodland survive, especially on the poorer soils and steeper slopes. In the dry region of eastern Walachia, the Bărăganul (Baragan) steppe, as well as along the margin of the Hungarian Plain, are areas of natural grassland, or prairie, and locally there are patches of sand dune, more or less stabilized by a covering of drought-resistant grasses. Along the valley of the lower Danube, from Turnu Severin eastward, and over the whole region of the delta are

marshes, made up of shallow lakes, partially reclaimed, and sluggish streams which enclose small low islands with willows and poplars. (N. J. G. P.)

4. Animal Life.—In its fauna Walachia has far more affinity to the lands lying south of the Danube than to Transylvania, although several species of *Claudilia,* once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Bărăganul steppe resemble the Russian prairies in their variety of mollusks and the lower kinds of mammals. More than 40 species of freshwater mussels (Unionidae) have been observed in the Rumanian rivers. The lakes of the Dobruja abound in mollusks—parent forms, in many cases, of species which reappear greatly modified in the Black Sea. Salmon and trout characterize the mountain streams, and in the Danube itself carp and sturgeon are particularly important.

The mountain fauna includes the chamois and the bearded eagle; the forest fauna the bear, wolf, fox, lynx, wildcat, stag, deer, and wild boar. In the steppe region are rodents, such as the hamster and gopher.

Birds are numerous, including four varieties of crows, five of warblers, seven of woodpeckers, eight of buntings, four of falcons, and five of eagles, while among the hosts of waterfowl which inhabit the marshes of the Danube are nine varieties of ducks and four of rails. (G. W. S.; N. J. G. P.)

II. THE PEOPLE

1. Ethnic Origins.—The Rumanian people, like all national groups in Eastern Europe, are of extremely mixed ethnic origins. In the main they appear to derive from the Thracian peoples who lived in the region in late prehistoric and Roman times, but they incorporate many other elements: the Roman settlers of the 2nd century A.D., the Slav invaders of the 7th and 8th centuries, Magyar invaders of the 9th and 10th centuries, as well as Turks, Germans, gypsies, and Jews. Other groups, the Celts, Goths, and Tatars, at some time occupied some part of Rumania, and must have influenced the racial composition of its people.

This variety of ethnic origin is reflected in the physical diversity of the Rumanian people. In terms of head shape there is a marked contrast between the brachycephalic peoples of the mountains and Transylvania, and the mesocephalic peoples of the eastern and southern plains. This division ignores language and ethnic tradition. In general the Rumanians are of medium height, 5 ft. 5½ in.–5 ft. 5¾ in. (166–167 cm.) though somewhat shorter in the northwest. Pigmentation shows greater variation; coloration is predominantly dark in the southeast, but over much of the country people are of medium to dark coloration, with a tendency for brunets to predominate. In a few areas, notably Transylvania, a blond type is numerous.

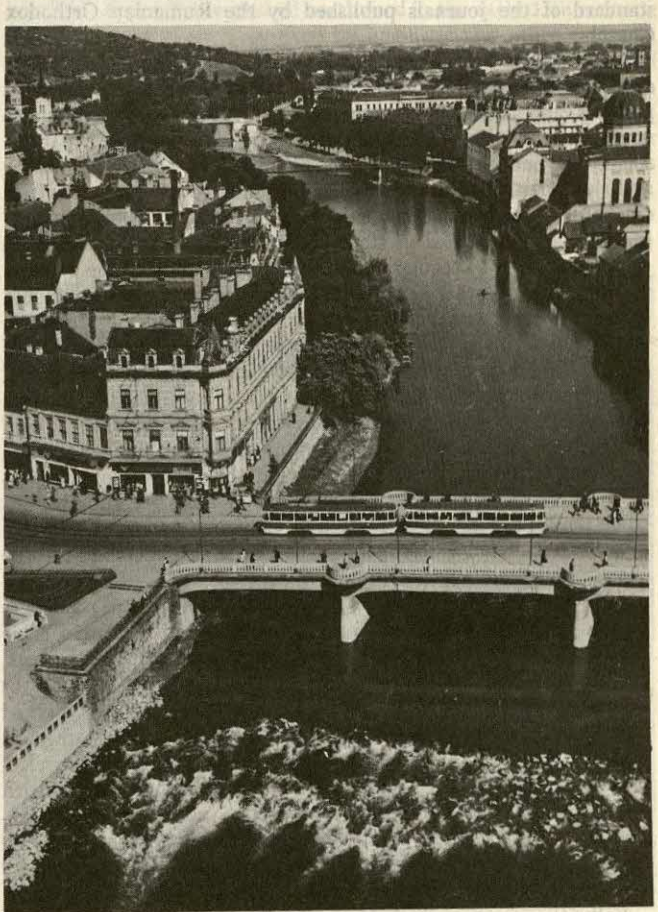
At the time when much of Rumania was conquered by the Romans, it was thinly peopled by Thracian tribes, which have come to be known as Dacians. They already possessed a complex racial history, and to this complexity the Romans contributed other elements. According to Rumanian tradition, Romans settled there in sufficient numbers to impart a veneer of Latin civilization to the region. Supposedly after the withdrawal of the Roman armies the romanized provincials maintained their Latin language and culture in the fastnesses of the mountains, and from this stock was gradually fashioned the Rumanian nation. It is more commonly held that the Rumanians are part of a wider group of romanized Dacians, known as Vlachs (*q.v.*). Their language, like Rumanian, is largely derived from Latin, and they are the descendants of the romanized inhabitants of the Balkans, as the Rumanians also claim to be. There is, however, this important difference: the ancestors of the Vlachs of the Balkan peninsula lived under Roman rule for many centuries, whereas Roman occupation of Dacia was relatively short-lived. Vlachs of the Balkans are known to have migrated northward across the Danube, and at one time were numerous in Slovakia. Some writers, especially Hungarian and Slav, doubt whether the Rumanians are the descendants of romanized Dacians and suggest that they derive from these Balkan Vlachs. The truth may perhaps lie between the two extremes, and the Rumanians of today probably derive from romanized Dacians, reinforced by Vlachs from beyond the Danube.

After the withdrawal of the Romans from Dacia, the region was invaded and probably also settled by Goths and other Germanic tribes, by invaders from the Russian steppe, and by peoples from central Europe. The cultural and linguistic pattern of many areas of Rumania was drastically changed, and undoubtedly many of these immigrant peoples were assimilated to the Rumanian people, losing their own linguistic and cultural traits in consequence. Nevertheless, the Rumanian language today has absorbed a great many Slavic and other elements. (*See* RUMANIAN LANGUAGE.)

2. Minority Groups.—Late in the 9th century the Magyar tribes invaded the Hungarian Plain from the south Russian steppe. They came by way of the Carpathian passes, and some of their number, the Szeklers (*q.v.*), were left behind in Transylvania, or were deliberately settled there after the arrival of the Magyars in the present area of Hungary, in order to protect the new state from fresh invaders from the east. The Szeklers have inhabited their present area in northern Transylvania at least since the Middle Ages. They are still a notable minority group, having retained their language, only slightly modified from the Hungarian of Hungary itself. By the terms of the present Rumanian constitution the province of Mureș (Hungarian, Maros) is a Magyar Autonomous Region.

The second most important national minority is the German, descended from settlers who came in the 13th century mainly from the Moselle Valley. They settled in the good farming country of Transylvania, and have since constituted a compact and distinctive group, perpetuating the costume, architecture, and folkways which they brought from Germany. In 1956 the number of this minority group was officially put at 384,708.

Other minority groups are relatively small. The Yugoslavs, numbering 46,517 in 1956, live mainly in the southwest, in territory annexed by Rumania in 1919 from Hungary, despite counter claims from Yugoslavia. They live in an area that is ethnically



BY COURTESY OF "CARPATI" RUMANIAN NATIONAL TOURIST OFFICE

VIEW OF ORADEA, SITUATED ON THE CRIȘUL REPEDE RIVER IN THE PANNONIAN BASIN

very mixed, with German and Hungarian communities in addition to the Rumanian and Yugoslav.

Jews lived in Rumania in the 15th century, but the majority came in from Poland and Russia during the 19th. They usually lived as a class apart from the rest of the population, and in 1939, 518,754 were recorded by the census as Yiddish-speaking. The Jewish population was greatly reduced by the territorial losses of 1940. The Jewish community suffered a great deal less from wartime persecution than those of Hungary, Czechoslovakia, and Poland, and in 1947 numbered about 428,300. This was greatly reduced by emigration to Israel, and in 1956 the Jews numbered only about 146,000.

In the east Rumania includes part of the settlement area of Ukrainians, Russians, Tatars, Turks, and Bulgarians. Each of these communities is, however, quite small; the largest, the Ukrainians, Ruthenians and Hutzuls, numbered 60,479 in 1956 and the smallest, the Bulgarians, 12,040. The Ukrainians are most numerous in northern Moldavia; the Turks, Tatars, and Bulgars in Dobruja, a region which throughout its history has been of great ethnic complexity. Russians numbered 38,731; the largest groups are in Dobruja, with others in western Rumania. The rest of the population—14,996,114 out of a total in 1956 of 17,489,450—are described as Rumanian. (N. J. G. P.)

3. Religion.—When the Rumanian Orthodox Church (*q.v.*) joined the World Council of Churches in November 1961 it claimed a membership of 13,000,000, or more than 70% of the population, although Communism had then been in power in Rumania for about 16 years. After a break of 20 years it was thus able to resume the prominent part it played at ecumenical conferences in the years before World War II, when its relations with the Anglican Church, in particular, were close. Many Orthodox theologians, who now train students at the two Orthodox theological institutes and six seminaries in Rumania, were trained in the West in prewar years, and they contribute to the high theological and ecumenical standard of the journals published by the Rumanian Orthodox Church.

Rumania has the most active of all Orthodox churches. There are 5 metropolitanates and 12 dioceses, each with several hundred parishes, and an extensive monastic life. As in other Communist countries, however, the church has no freedom to play a part in society beyond the restricted role permitted by the state. Patriarch Justinian, appointed in 1948, did much to promote activities to conserve and strengthen Orthodoxy in Rumania, while remaining an overt supporter of state policies. His activities included the organization of regular courses for priests all over the country to equip them to carry out their pastoral duties in a Communist society in such a way as to remain loyal citizens of the state. Within a few months of his enthronement the Eastern Rite Catholics in Rumania, numbering 1,500,000, mostly in Transylvania, were reincorporated in the Orthodox Church and their five bishops were arrested. At the same time the Roman Catholic Church, with a slightly smaller membership drawn mostly from Hungarians and Swabians in Transylvania, also suffered the removal of its hierarchy through imprisonment. The smaller minority churches include the Lutheran, the Reformed or Calvinist, and the Unitarian. The Lutheran and Reformed churches are also members of the World Council of Churches. (X.)

4. Customs and Culture.—The Rumanians are a peasant people and have retained a strong and vigorous peasant culture. Their folkways, like their language, derive from several ethnic roots, and this, together with prolonged isolation, helps to account for both its variety and its richness. There are strongly marked regionalisms in the predominant cultural traits. Homes are built of wood in mountainous and forested regions, of mudbricks elsewhere. They are often highly decorated and, with their garden fences and entrance gates, have long been a vehicle for the expression of folk art. In the mountainous areas the churches are often of wood and highly decorated. At Bucharest is a "village museum," where examples of village houses have been gathered.

Folkways continue to show themselves in peasant dress. Men still wear the white, baggy trousers and long, white coats in many areas, and women's costumes and embroideries, conforming to the local style and pattern, are not kept only for Sundays or for the amusement of tourists, as in more sophisticated peasant countries. Traditional peasant music, with strong gypsy overtones, is widely played, both on modern instruments and on the traditional wind and string instruments and drums. Some of this peasant music has been collected and made available by Béla Bartók and the Rumanian Georges Enesco.

The basic food is a pasta, known as *mamaligo*, prepared from corn meal. The national drink is made from plum juice, and resembles the Balkan *slivovica*. Music and costume, and even church and domestic architecture, have a gay and colourful appearance, in contrast with the tragic history and the sombre folklore—concerned above all with vampires and evil spirits—of the Rumanian people.

III. ARCHAEOLOGY

Scientific archaeological work in Rumania can be said to have begun when G. Tocilescu published his *Fouilles et recherches archéologiques en Roumanie* in 1900. Research is coordinated by the Rumanian People's Academy; annual reports with French and Russian summaries appear in *Materiale şi cercetări arheologice* and articles in foreign languages in *Dacia*.

Lower Paleolithic discoveries, especially from caves and gravels in the Dîrjov Valley, near Slatina, include early tools resembling the Oldowan of East Africa. At Mitoc and Ripiceni in Moldavia, flints akin to the Clactonian tools of England and the Levalloisian of France were found. Extensive Upper Paleolithic and Mesolithic finds were made near Ceahlău in the Moldavian Carpathians.

The Neolithic has been more widely discovered and more fully studied than the Paleolithic, and 16 distinct cultures have been identified. The earliest, the Criş culture, was closely related to the Starcevo and other cultures of the Balkan peninsula. From the Criş culture evolved a number of related cultural groups, including the Fiera-Dudeşti culture in southern Rumania and the Turdaş culture in the southwest. These were based on agricultural village settlements. At the same time cultures characterized by pottery with geometrical decoration spread from the north into Moldavia and southeastern Transylvania, and the Hamangia culture, in which southern (Aegean) elements were incorporated, evolved in the Dobruja.

The Fiera-Dudeşti culture gave rise to the Boian, characterized by terrace settlements, consisting at first of mud huts and later of fortified promontory settlements. This phase was marked by the introduction of copper axes, the extension of agriculture, and the breeding of domestic animals. The Boian culture spread northward into Transylvania and northeastward to Moldavia, assimilating the earlier cultures found there. In the core area of the Boian culture, graphite-decorated pottery, marble, gold, and terra-cotta figurines, and inhumation marked the emergence of the Gumelniţa culture.

The excavations at Cucuteni near Iaşi marked the culmination of Neolithic culture in Rumania. Three large Cucuteni-type settlements, each of from 40 to 80 dwellings, have been excavated. These were rectangular, with wattle-and-daub walls, and floored with split wooden beams. A pottery of extraordinary beauty and delicacy was made, ornamented with spirals, wavy lines, and geometrical figures, and decorated in white, red, and black.

The end of the Neolithic in Moldavia and southern Rumania was troubled. Many Neolithic settlements were destroyed by fire. Subsequent burials show a change in funerary practice, and the evidence of material culture suggests the pastoral nomads of the Russian steppe rather than the earlier Neolithic inhabitants of Rumania. There was evidently a massive westward movement of steppe dwellers, and pastoral tribes overran much of Rumania. In time new—though still primarily pastoral—cultures emerged from the ruins of the old. One of these was the Coţofeni culture, so known from its type-site in Oltenia.

The Bronze Age made its appearance in Rumania early in the 2nd millennium B.C. and bronze-working began to flourish in Transylvania and neighbouring areas, where the raw materials could be obtained. Bronze tools allowed the forest to be cleared more easily and agriculture to be extended. Lowland areas, having

better soils, were brought under cultivation, and pastoralism was relegated to the hills. In three regions agricultural communities emerged with a relatively high cultural level. A large fortified settlement at Sărata-Monteoru, near Buzău, gave evidence of a well-developed culture. At Gîrla Mare, in southwestern Rumania, another culture, characterized by the practice of cremation and by elaborate ornaments and beautifully carved figurines, appeared; and at Otomani, in the Criş region, yet another developed, distinguished by its fortified settlements, beautifully decorated pottery, and bronze ax-heads. These Bronze Age cultures achieved their maximum development in the 15th century B.C., when they spread through the middle and lower Danube valleys.

In the 12th century B.C. iron appeared, first as small ornaments, then replacing bronze in tools and weapons. But Rumania never really shared the Iron Age culture that emanated from the upper Danube Valley, because invaders from the Russian steppe, this time the Scythians, again overran it. The Scythians appear to have made semipermanent settlements of their own, especially in the Dobruja, and their burials are extensively found in Transylvania and Walachia. They also greatly influenced the local societies, which now display weapons and ornaments of types commonly associated with the Scythians. Though the Scythians were ultimately assimilated by the local peoples, the prosperity of Rumania received a blow from which it never really recovered until Roman times.

Greek colonists began to settle on the coast of the Dobruja in the 7th century B.C. when the Milesians occupied the promontory of Istros (Latin Histria) in a lagoon near the Danube mouth. Excavations, begun there in 1914, recovered much of the ancient city plan. To the south, the Greeks established two other coastal cities: Callatis, a Megarian settlement at modern Mangalia, and the Milesian colony Tomis (modern Constanţa). Callatis became in classical times a port for the export of grain from its rich hinterland. Many interesting Greek and native finds have been made at Callatis and Tomis.

The contemporary native culture grew out of the fusion of Geto-Dacian peoples with Scythian and Celtic invaders; they were never hellenized as the Thracians were. Fortresses with earth defenses were widely built in Rumania. Those at Zimnicea near the Danube, at Poiana in Moldavia, and at Piscu Crîsani, Tinos, and elsewhere in Walachia, have been excavated, revealing a wide range of local artifacts and also evidence of extensive trade with the Greeks. In the Orăştie Mountains in Hunedoara are the particularly complex fortifications on a succession of hilltops leading up to the citadel of Grădiştea Muncelului; on the terraces around it were civil and religious buildings, including what appears to have been an astronomical observation platform. This is identified with the Dacian capital Sarmizegetusa (replaced by the Roman colony and modern town of the same name).

The Dacians were beginning to create an organized state but it crumbled under Roman attacks in A.D. 101–106. Traces of these campaigns are numerous, and some of the piles of Trajan's bridge across the Danube survive at Turnu Severin. One of the great walls across the Dobruja from Hinog (ancient Axiopolis) to Constanţa may also be his, but the most impressive of all the Roman monuments in Rumania is the Tropaeum Trajani at Adamclisi in the Dobruja; much of its sculptured decoration still lies around the massive concrete core. Roman towns explored in the Dobruja include Ulmetum and Capidava. Much of what is now Rumania—Banat, Transylvania, Oltenia—became the Roman province of Dacia. Roads were laid out, colonies and cities founded, and forts built along the frontiers (*see* LIMES). Roman inscriptions have been found almost as far north as the Ukrainian border. At Verespatak, near Cluj, there are considerable traces of Roman mining.

Probably in A.D. 271 the Roman armies of Aurelian and some of the Roman colonists withdrew from Dacia, under pressure from the Goths and other invading tribes. The Rumanians claim, on the evidence of a number of post-Roman sites excavated, that part of the romanized population lived on in humble circumstances, withdrawing to more remote and protected settlements. To the Gothic occupation belongs the famous 4th-century hoard of gold treasure found at Pietroasa. The Goths were followed by the Huns and other migrating peoples.

The civilization of Byzantium had little influence upon Rumania. Byzantine remains are not of importance until the 14th century when the church of St. Nicholas at Curtea de Argeş was built. The frescoes there rank as the finest and oldest Byzantine works of art in the country. A distinctive and beautiful architectural style later evolved, particularly in Moldavia, flourishing mostly in the 16th and early 17th centuries. The church of Trei Erarchi ("Three Saints") at Iaşi, founded in 1639, is one of the finest examples. This style owes little or nothing to Greek or Slavonic tradition in matters of decoration, though the structure is in essence Byzantine. Byzantine traditions dominated religious art down to the 18th century. (N. J. G. P.)

IV. HISTORY

The early history of the lands which constitute modern Rumania, down to the end of the period of Roman domination, is traced in the article DACIA. Roman rule in Dacia lasted for 163 years. From the 3rd to the 12th century wave after wave of barbarian invaders from the east passed over the undefended country—first came the Germanic Goths and Gepidae, then Slavs, followed by the Avars (*q.v.*), and in the second half of the 7th century by the Bulgars. The Bulgarian domination, lasting for two centuries, allowed a rudimentary civic life to take shape, and it was the Bulgars who, after the conversion of their tsar Boris in 864, brought Christianity in its eastern form to the ancestors of the Rumanians, building on earlier Latin foundations (see *Religion*, above). At the end of the 9th century the Bulgars were overcome by the Magyars; later came a brief incursion by the now almost vanished Pechenegs and Kumans (*qq.v.*).

One school of historians maintains that the Daco-Roman population north of the Danube was obliterated during these invasions and that the Rumanians of today are descended from Vlach tribes south of the river who pushed northward in the early 13th century. The Rumanian view, supported by linguistic and other evidence, is that the Roman withdrawal affected only the military and official classes, while the body of the Daco-Roman inhabitants were driven by the invaders into the Carpathians, becoming the Vlachs of Transylvania. The Macedo-Romans south of the Danube, later known as Kutso-Vlachs, similarly sought shelter in the Pindus mountains. The controversy is considered in the article VLACHS.

Transylvania, regarded by Rumanians as the cradle of their nation, was conquered in the 11th century by King Stephen I of Hun-

EASTFOTO

MEDIEVAL CASTLE AT BRAN IN THE BRAŞOV REGION, BUILT IN THE 13TH CENTURY BY GERMAN SETTLERS IN TRANSYLVANIA

gary, but all records of its early inhabitants were destroyed in the Tatar-Mongol invasion of that country in 1241. The authentic history of the Vlachs does not begin until the end of the 13th century, when they are found establishing themselves south of the Carpathians in two distinct groups, one settling in the area later known as Walachia (called Muntenia by the chroniclers) and the other to the east in Moldavia. The incoming Vlachs fused with a population that already contained a Vlach element, but consisted mainly of Slavs and Tatars with an admixture of Pechenegs and Kumans.

The two regions thus colonized became the principalities of Walachia and Moldavia, whose annals remain distinct until 1774, but can thereafter be combined in one narrative, the Turkish administration being uniform. In 1859 the two principalities were formally united under the name of Rumania. The historical narrative which follows is therefore arranged under five headings, *Walachia, Moldavia, The Danubian Principalities, Rumania,* and *Greater Rumania.* The history of Transylvania is given in a separate article.

A. Walachia

Tradition, embodied in a local chronicle of the 16th century entitled "History of the Ruman Land Since the Arrival of the Rumans" (*Istoria tierei Românesci decându au descălicati Românii*), gives 1290 as the date of the founding of the Walachian state, asserting that in that year a voivode (prince) of Fagaraş in southern Transylvania crossed the mountains with a body of followers and established himself at Cîmpulung in the foothills, moving later to Curtea de Argeş. The name given for this first leader, Radu Negru (Ralph the Black), is probably a confusion with that of a later Walachian voivode, but the southward movement at that period of Vlach peoples from the mountains to the Danubian plain can be affirmed with certainty. Walachia itself was known to its own people as Muntenia, land of the mountains, after their former home. Historians who deny the continuity of Daco-Roman (Vlach) settlement in Transylvania have to postulate a northward migration of Vlachs from across the Danube to the Carpathians at the beginning of the 13th century to account for the indisputable southward movement at its close. The search for a new home in the south was due to the consolidation of Hungarian feudal power in Transylvania and of the feudal system, to the arrival of German settlers, and to the growing proselytizing zeal of the Hungarian kings as faithful servants of the papacy. The Vlachs, since the introduction of organized Christianity under Bulgarian influence, had belonged to the Eastern Orthodox Church, taking the Byzantine side against Rome in the schism of 1054, though later some of their leaders came under Roman influence.

The new principality remained at first under the domination of Hungary, but the prince Basarab I defeated the Hungarian king Charles I Robert in 1330 and secured independence. Vladislav (*c.* 1364–77), although again defeating the Hungarians, accepted a form of Hungarian suzerainty in return for investiture by Louis I the Great, Charles Robert's successor, with the banat (frontier province) of Severin and the duchy of Omlas.

The early days of the principality were conditioned by the struggle against Hungary, but with the reign of Mircea the Old (1386–1418) a new period began, that of the struggle against the Turks. The first princes of Walachia, in search of help against Hungary, had contracted matrimonial and military alliances with the two Slav states south of the Danube, Bulgaria and Serbia, but both empires were already at the point of extinction at the hands of the Turks. Tradition recounts that a Walachian contingent helped the Serbs at the Battle of Kosovo in 1389; it is a fact that the sultan followed up his victory by invading Walachia, which first appears in 1391 as a tributary of the Sublime Porte. The final overthrow of Bulgaria in 1393 left Walachia open to further Turkish advance but Mircea succeeded in holding the invaders back on the Danube marshes in 1394, and in the following year made an alliance with Hungary. The joint Christian forces, which included French and Burgundian contingents, were defeated in 1396 at the Battle of Nikopol (Nicopolis). Mircea had thrown over an earlier alliance with Poland in order to secure one with Hungary; accordingly the Poles, taking advantage of the defeat at Nikopol, intrigued for his deposition and replaced him by his son Vlad, who accepted Polish suzerainty. Mircea later returned, reestablished, and, for a time, increased his power by exploiting the quarrels between the sons of the sultan Bayazid I. In 1417, however, Walachia was forced to capitulate to Turkey under Sultan Mohammed II, though its dynasty, territory, and Christian religion were left intact. Mircea died a year later.

1. Early Years of Turkish Rule.—After Mircea's death, Walachia, convulsed by internal struggles, could take no active part against the Turks, but they were for a time again driven back by the Hungarians under the brilliant János Hunyadi (*q.v.*), a Rumanian by race though enrolled in the Hungarian nobility. He deposed one of the weak Walachian princes and nominated Vlad IV—who in 1456 acknowledged Hungary as suzerain—a man whose unbelievable cruelties earned him the name of "the Impaler" (Tepes). Vlad (1456–62 and again in 1476) was able briefly to defy the Turks; with his death, resistance crumbled rapidly, Walachian princes succeeding one another after very short reigns.

The instability of the throne was in part due to the mixture of the hereditary and elective principles in the system of succession; the council of boyars (nobles), which came under Turkish rule to be known as the divan by analogy with the Turkish institution of that name, chose the prince from legitimate and illegitimate heirs of his dead predecessor.

The only prince of the 16th century deserving mention is Neagoe Basarab (1512–21), who founded cathedrals at Curtea de Argeş (*q.v.*) and at Tîrgovişte, which had become the Walachian capital, and endowed monasteries in Walachia, besides making noble contributions to Mount Athos. The patriarch of Constantinople honoured the dedication of the Argeş monastery with his presence.

Neagoe's son and successor was imprisoned by the Turks who proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately. They elected Radu, a kinsman of Neagoe, as prince and defeated the Turkish commander Mahmud Bey with Hungarian help at Grumatz in 1522. The continuance and extension of Turkish control became inevitable, however, after the crushing defeat of Hungary in 1526 at the Battle of Mohács.

Walachia thereafter became a line of communication for Turkish expeditions against Hungary and Transylvania. The prince Alexander, who succeeded in 1591, actually farmed out his possessions to his Turkish supporters, and it seemed that Walachia must succumb to direct Ottoman rule.

2. Michael the Brave, 1593–1601.—The Turkish advance was once more to be halted, though for the last time, under a new prince, Michael (*q.v.*), son of Petraşcu, ban of Craiova. In 1593 he secured the deposition of Alexander and his own election by raising a loan at Constantinople of 400,000 ducats to make the customary presents to the Porte and was supported by Sigismund Báthory (*q.v.*), prince of Transylvania, and by the English ambassador at Constantinople, Edward Barton. Michael was to prove a thorn in the flesh to the Turks, but was much criticized for making Walachia once more subject to Hungarian princes in return for their help. In concert with the Moldavian prince Aaron, Michael organized a massacre of Turkish guards and settlers (November 1594) and with the support given by Báthory in return for the acknowledgment of his suzerainty proceeded to invade Turkish territory, taking Ruse (Ruschuk), Silistra, and other places on the right bank of the Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was defeated in the battles of Serpăteşti and Stăneşti (1595). The sultan next sent Sinan Pasha the Renegade to invade Walachia with 100,000 men. Michael withdrew to the mountains, but with aid from Báthory and a Transylvanian contingent resumed the offensive and stormed Bucharest, pursuing the main body of Sinan's forces to the Danube. In 1597 the sultan, wearied with these defeats, reinvested Michael for life.

Walachia's subjection to Hungary was not permanent. On the abdication of Sigismund Báthory, Michael, with the support of the emperor Rudolf II, attacked and defeated his successor Andreas

Báthory in October 1599 and had himself proclaimed prince of Transylvania, being acknowledged by the emperor as his lieutenant and having his position ratified by the diet. The Vlach peasant population of Transylvania was encouraged to revolt against the Magyars by having an overlord of their own race, but Michael, whose support in Walachia rested on the boyars, helped the Magyar nobility to suppress the peasant rising. Despite this the Magyars distrusted Michael, both as a despised Vlach and as a Habsburg agent, and he found his position in Transylvania insecure while Moldavia remained as a centre for Magyar and Polish intrigue. In May 1600 he invaded that principality, deposed the prince Jeremy (Ieremia) Movilă and without waiting for the emperor's sanction had himself proclaimed "prince of Walachia, Transylvania, and of all Moldavia."

Though Rudolf confirmed Michael in his appointment he grew suspicious of his vassal's progress and determined to undermine his position. The imperial commissioner, Gen. Georgio Basta, was instructed to give support to the disaffected Magyar element in Transylvania, and Michael was driven out by a successful revolt. At the same time the Poles invaded Moldavia, and restored the unseated prince, while Walachia itself was also attacked. Michael appealed to the emperor, who restored him to favour, and in conjunction with Basta he defeated the Transylvanian forces at Goräslău in 1601. Basta, however, jealous of Michael's returning prosperity, procured his murder at Turda (Cîmpia Turzii) almost immediately after their joint victory.

Michael the Brave (Mihai Viteazul) is the leading Rumanian national hero, partly because it was he who made the last stand before the era of Turkish and Greek domination, but chiefly because for the first time since Dacian days he brought all the Rumanians, scattered in three principalities, under one rule, thus weaving the stuff of the national dream which was not to become reality until 1918.

3. The Period of Greek Penetration, 1634–1711.—After Michael's death Radu Şerban of the Basarab dynasty was appointed prince of Walachia by the emperor's wish, but was deposed by the Turks in 1611. A succession of insignificant puppet princes followed him, the Greek element becoming increasingly apparent. There was a temporary rally in the second quarter of the 17th century under Matei Basarab, who succeeded in holding the throne for 22 years—warding off repeated attacks from his rival Vasile Lupu of Moldavia—and did much for the arts and the endowment of churches. He founded a printing press at the Govora monastery which issued a compendium of canon law, *Pravila cea mică*, the first Rumanian book to be printed in the principalities (Gospels in Rumanian had been printed in the preceding century by the Protestants in Transylvania).

The successor of Matei, Constantin Serban, was the last Basarab to rule in Walachia. On his death the Turks, who in 1698 moved the capital to Bucharest—at a safer distance from the Transylvanian frontier—began to exercise a more direct influence over the ruling families, who were now frequently of Greek origin. Şerban Cantacuzino (1678–88), the first important Greek prince, was an able man; forced to assist the Turks at the siege of Vienna, he opened up secret communications with the emperor, who granted him a diploma creating him a count of the empire and recognizing his descent from the imperial house of Cantacuzino. In 1688, the year of Şerban's death, the first Rumanian Bible was printed.

Şerban's successor was his nephew Constantin Brancovan (Brîncoveanu), descended on his mother's side from the Basarabs, who pursued a policy of cautious balancing between the Porte, the emperor, Poland, and the rapidly westward-thrusting Russia. Brancovan sent congratulations to Peter I the Great on his victory at Poltava and asked for help for the Christian cause. Finally falling a victim to intrigues, Brancovan was deposed and executed at Constantinople in 1714.

4. The Phanariote Regime, 1714–1821.—At the beginning of the 18th century Turkish power was in obvious decline and the strength of Austria and Russia growing. Alarmed by the intrigues of Brancovan of Walachia and Cantemir of Moldavia with Vienna and Moscow, the Porte decided to exercise direct control over the principalities. Instead of reducing them to mere pashaliks, however, the Turks employed Greeks from the Phanar district of Constantinople as their agents. The new princes, or hospodars, insecure of tenure, had to extract the maximum from the country in the minimum of time—the average duration of a reign was only two and a half years—and thus the word Phanariote has come to stand for bribery, exaction, and corruption, though the hospodars themselves were often men of culture and intelligence.

Under this oppressive regime many peasants emigrated; in 1741 there were 147,000 peasant families in Walachia, but four years later their number was reduced by half. In the face of this, the enlightened prince Konstantinos Mavrokordatos decreed the abolition of serfdom in 1747, but after numerous rises and falls from favour he was finally imprisoned in 1763 after efforts at reform had proved abortive.

The tide of Ottoman domination was now ebbing fast under Russian pressure; after defeating the Turks at Hoţin in 1769, Russian troops occupied both principalities, the bishops and clergy taking an oath to the empress Catherine. At Focşani in 1772 Catherine demanded that the Porte recognize the independence of Walachia and Moldavia under Russian guarantee, but she was deterred by Austrian opposition, and temporarily satiated by the partition of Poland.

B. Moldavia

1. From the 14th Century.—Moldavia took shape in circumstances similar to those of its sister state but somewhat later: according to chronicles, more plentiful than those dealing with Walachia, Dragoş, founder of the principality, emigrated southward with his followers from Maramureş in the northern Carpathians (the dates given vary from 1299 to 1342). An independent state first emerged about 1359 under Bogdan I. One of the early princes, Petru Muşat (1374–92), was a member of the Basarab family of Walachia and, in pursuance of the interests of his kinsman, Mircea the Old, recognized the suzerainty of the king of Poland whose sister he married. From this period date Poland's ambitions to control the new state, which had hardly emancipated itself from Hungarian tutelage. The first important prince, Alexander the Good (1400–32), acknowledged Polish overlordship and laid the foundations of organized life in the principality. Civil war reigned among Alexander's successors, but a new era in Moldavian history opened with the reign of his grandson Stephen the Great (1457–1504), who was to prove one of the greatest champions of Christendom against the Turks. Patriotic and religious, Stephen was doubly affected by the fall of Constantinople four years before his accession; the cutting of the trade route through the Bosporus was disastrous for the commerce of the principalities and the desecration of Hagia Sophia was a blow to Christian feeling. Stephen's whole reign was devoted to the attempt to rally the west against the infidel; he appealed for help to Poland, Hungary, and Venice as well as to the pope Sixtus IV, who gave him the title "athlete of Christ."

Stephen inflicted a crushing defeat on the Turks at Vaslui in 1475, and again repelled them the following year. Poland and Hungary, however, never gave him the solid support for which he had hoped; in 1484 the Turks captured his key fortresses of Chilia and Cetatea Albă (Akkerman, from 1944 Belgorod-Dnestrovski), and the following year burned the Moldavian capital Suceava. Once again Stephen rallied and defeated the Turks in 1486 at Scheia near Roman. As early as 1484, after the loss of his fortresses, he had been compelled to do public homage to King Casimir IV of Poland, but in 1499 he was able to draw up a treaty on equal terms. Poland, however, once again failed to honour its pledge to give help. On his deathbed Stephen, realizing the hopelessness of securing united action from Christendom, advised his son to submit to the Turks if they would respect the framework of church and state.

Stephen encouraged the arts, gave generous grants of monastic lands, and built more than 40 stone churches and the great monastery of Putna. Stephen's son Bogdan III, the "one-eyed" (1504–17), at feud with Poland over Pokuţia (Pokucie), which his father had annexed, and lacking support from the already shaken Hungary, was forced in 1513 to pay annual tribute to the sultan

while securing guarantees for the Christian religion and Moldavian institutions. In the anarchy following the Battle of Mohács a strange figure ascended the Moldavian throne, Petru Rareș (1527–38 and 1541–46), an illegitimate son of Stephen. Allying himself with the Turks, he made war on the imperial forces in Transylvania and on Poland, attempting to recover the lost Pokuția. Later he allied himself with the emperor against Poland and the sultan, but was defeated and deposed in 1538. In 1541 he returned to the throne with Turkish help, but concluded a secret treaty with the emperor against the Turks. His successors could no longer oppose Turkish power.

2. Turkish Penetration.—Petru's son actually accepted Islam; the sultan strengthened his hold on Moldavia by occupying a series of fortresses and increased the tribute. From the middle of the 16th century each aspirant to the Moldavian throne had to buy the consent of the Porte, and the way was thus open to adventurers. The most dramatic was Jacob Basiliscus Heraclides who seized Moldavia from the prince Alexander IV Lăpușneanu (1552–61) with Turkish support. A Greek by birth, he had traveled over Europe and had become the friend of Philipp Melanchthon; he attempted to found an educational system in Moldavia, but his heavy taxation led to revolt and he was assassinated in 1563. Under the restored Lăpușneanu (1563–68) and under Bogdan IV (1568–72), Moldavia relapsed into obscurity. Bogdan's successor John the Terrible (1572–74), provoked by the Porte's demand for increased tribute, rose against the oppressor, but was defeated and slain in 1574. Moldavia did not rally until the victories of Michael the Brave at the turn of the century when it was actually incorporated for a year in Michael's Great Dacian realm. After Michael's murder, the Poles again asserted supremacy, but the Porte resumed its domination in 1618. No prince of any importance occupied the throne until Vasile Lupu (1634–53), a brave soldier of Albanian origin. He might have achieved success against the Turks, but chose instead to attack his neighbour Walachia, coveting its throne. He married one of his daughters to Timothy, son of the celebrated Ukrainian hetman (general) Bohdan Chmielnicki and raided Walachia with the help of his son-in-law, but was routed by the veteran Matei Basarab. He was overthrown by a conspiracy of Moldavian boyars, and after his death Greek influence became paramount. One of the Greek princes, Dimitrie Cantemir (1710–11, *q.v.*), attempted to exchange Turkish for Russian sovereignty, and proving unsuccessful went into exile in St. Petersburg. He was a scholar whose *Descriptio Moldaviae* is a valuable historical source.

The Phanariote regime in Moldavia is generally reckoned from the reign of Nikolaos Mavrokordatos, Cantemir's successor; it was similar to that in Walachia, and indeed the princes were frequently shifted by the Turks from one throne to the other. Moldavia was perhaps more prosperous than Walachia at this period and had a considerable export trade in timber, salt, wine, and foodstuffs.

C. The Danubian Principalities

1. After 1774.—The Treaty of Kuchuk Kainarji which ended the Russo-Turkish War in 1774 altered the situation in both Walachia and Moldavia. Russia restored the principalities which it had occupied, to the sultan (Moldavia, however, lost its northern tip, Bukovina [*q.v.*], which Austria, profiting by the situation, annexed in 1775) on conditions which included provisions favourable to the territories themselves. The tribute was to be reduced, and the agents of Walachia and Moldavia at the Porte were to have diplomatic status; Russia was accorded a virtual protectorate. In view of Turkish attempts to evade fulfilment of the treaty, Russia secured a more precise definition of its rights in the convention of Ainali-Kavak (1779) and strengthened its position in 1782 by appointing a consul in Bucharest. Austria countered by dispatching an "agent" Ignazio Rajčević, whose *Osservazioni storiche intorno la Valachia* (1788) is one of the best sources for the period. In the Russo-Turkish War which broke out again in 1787 the principalities once more provided battlefields, and Prince G. A. Potemkin made his headquarters at Jassy (Iași). In 1791, when peace was imminent, a group of Walachian boyars, fearing the effects of renewed Ottoman rule, addressed an appeal to Austria and Russia which, though it achieved no results, is of interest as an early sign of the awakening of national feeling. The boyars asked for the ending of Phanariote rule, the return of native princes and the creation of a national army. By the Peace of Jassy (Jan. 9 [N.S.], 1792) Russia had to evacuate the principalities, the Dniester (Nistru) being recognized as its frontier, and the privileges of the principalities accorded in earlier treaties were confirmed. In defiance of treaties the Porte continued to change the princes almost yearly, until in 1802 the Russians obtained a fresh convention under which every prince was to hold office for at least seven years and could not be dispossessed without Russian consent.

The two new princes were strongly under Russian influence. Konstantinos Ypsilantis of Walachia, encouraged by the convention, refused some Turkish requisitions, acted as intermediary between the Serbs and Russia in the Serb revolt of 1804 and tried to embroil the French and the Porte. Napoleon's envoy at Bucharest denounced both princes as traitors and influenced the Porte's decision to dethrone them in 1806 without consulting Russia. Russia occupied the principalities and the Turks declared war in December 1806; Moldavia and Walachia had become pawns in the intrigues between the emperor Alexander, the Porte, and Napoleon. The Russian occupation, which lasted six years, reduced the country to a desert; produce was carried off, the coinage debased, and labour requisitioning was enforced by the deportation of recalcitrants to Siberia. The Christian populations exchanged hope and confidence in a liberator for a profound suspicion and fear of Russia which remained rooted in Rumanian minds.

Russia's design to incorporate the principalities in its empire was frustrated by the Peace of Bucharest (1812), but it secured the cession of southeastern Moldavia, known as Bessarabia (*q.v.*). The two princes who were appointed after the peace in 1812, Ion Caragea in Walachia and Scarlat Callimachi in Moldavia, were masters of extortion. The former increased the taxation eightfold, partly by creating 4,000 new boyars. Both were strongly Greek in feeling, and were supported by some of the boyars, who, disappointed in Russia, dreamed of a new Greco-Rumanian Byzantium. Caragea was in secret relations with the Greek revolutionary movement, Philiki Etaireia, which was being fostered at Odessa under Russian auspices. The way was thus prepared for the adventure of Alexandros Ypsilantis, son of the Walachian prince Konstantinos and *aide-de-camp* of the tsar, who marched into Moldavia at the head of the Etairists in 1821. He received the support of the Moldavian prince Michael Suțu, but the boyars were hostile in Moldavia and still more so in Walachia where a national popular movement led by Tudor Vladimirescu (*q.v.*) turned not against the Turks but against the Phanariots. Turkish troops which invaded to crush Ypsilantis were not finally withdrawn until 1824. The Turks, anxious to divide the Rumanians from the Greeks, thought it wise to heed the former's demands and the Rumanians took advantage of this to secure a number of reforms in the national interest. The reforms included the promulgation of laws in Rumanian and the appointment of native princes, the first of whom were Ioan Sandu Sturdza (Sturza) in Moldavia and Grigore IV Ghica in Walachia. Ghica's family, though of Albanian extraction and settled at the Phanar, was entirely rumanized. Both princes were anti-Greek and unacceptable to the Russians; Sturdza was accused of subversive tendencies because he cherished plans for constitutional reform, including an elected assembly.

2. Kiselev and the "Règlement Organique."—Russia and Turkey resumed relations in 1825 and by the convention of Akkerman signed by them in 1826 the privileges of the principalities were once more confirmed, and Russia was again allowed a voice in elections to the two thrones. On the outbreak of hostilities between Russia and Turkey again in 1828, Russia once more occupied Walachia and Moldavia. The Peace of Adrianople in 1829 left them still tributary to the sultan, but wholly under Russian protection. The two princes were thenceforth elected for life.

Russia secured a continuation of its occupation by making evacuation conditional on the payment of an impossibly high indemnity by Turkey. The occupation, which had again been exceedingly onerous during the war, became more enlightened after the sign-

ing of the treaty, a change which was largely due to the Russian administrator, Count Pavel Kiselev. The boyars, under Kiselev's supervision, drew up a constitution known as the *Règlement organique*, promulgated in Walachia in 1831 and in Moldavia in 1832. It was wholly oligarchic in character, but was an advance insofar as legislative and administrative powers were vested in a native elected body. The economic provisions of the *Règlement*, however, deepened the cleavage between the boyars and the peasant class and were censured by Kiselev. The *Règlement* was ratified by the Porte in 1834, whereupon Russia withdrew its troops.

3. The National Movement and 1848.—The new princes, Alexandru II Ghica (1834–42) in Walachia and Mihai Sturdza in Moldavia, were, however, strongly under Russian influence. Ghica's successor Gheorghe Bibescu (1842–48) had been educated in Paris and was influenced by the new spirit of romantic nationalism. In agreement with Sturdza he removed the fiscal barriers between the principalities. Meanwhile a new generation of Rumanians was growing up, educated in Paris or looking to France for inspiration; these came rapidly to the front in the great crisis of 1848 which in the principalities took a form partly national and partly social. The national movements in Moldavia and Walachia were spurred on by the dramatic upsurge among the downtrodden Rumanian peasants of Transylvania, which culminated in the "field of liberty" demonstrations at Blaj in May 1848. Sturdza in Moldavia proved able to quell popular agitation; Bibescu, although he had some sympathy with the movement, lacked courage to lead it and fled, leaving in power a provisional government largely controlled by Ion C. Brătianu (*q.v.*), first head of the great Liberal family which for so long dominated Rumanian politics. The Turks, under Russian pressure, were forced to put down the new movement; joint Russo-Turkish military intervention restored the *Règlement organique*. The Balta-Liman convention of 1849 laid down that the princes should again be appointed for seven years only; the assemblies were replaced by so-called *diwans ad hoc*. Grigore V Ghica was appointed prince in Moldavia, and Barbu Ştirbey, brother of Gheorghe Bibescu, in Walachia.

4. Crimean War and Treaty of Paris.—Russian troops did not evacuate the principalities until 1851, and during the Crimean War they were occupied in turn by Russia and Austria. Although they suffered severely, the Austrian occupation brought material benefits and opportunities of contact with the west. The Treaty of Paris (1856) placed the principalities with their existing privileges under the collective guarantee of the contracting powers, thus ending the Russian protectorate, though retaining the suzerainty of the Porte. The Russian frontier was withdrawn from the mouths of the Danube by the return of a strip of southern Bessarabia to Moldavia. The existing statutes were revised in 1857 by a European commission with a Turkish member meeting at Bucharest, assisted by two *diwans ad hoc* called together by the Porte.

5. Union of the Principalities.—The *diwans* voted unanimously for autonomy, union of the principalities under the name of Rumania, a foreign hereditary prince, and neutrality. The *diwans* were dissolved by the Porte in January 1858 and in August the convention of Paris accepted their decisions with modifications. There were still to be two princes and two assemblies, but a central commission at Focşani was to prepare measures of joint concern. The two assemblies, meeting at Iaşi and Bucharest respectively, then elected a single prince in the person of Alexandru Ion Cuza (*q.v.*) on Jan. 17 (N.S.), 1859. The *de facto* union of Rumania was thus accomplished.

D. Rumania

A new conference met in Paris to discuss the situation and in 1861 the election of Prince Cuza was ratified by the powers and the Porte. In February 1862 a single ministry and a single assembly replaced the *diwans* and central commission. Cuza, in May 1864, promulgated by plebiscite a new constitution providing for a senate as well as an assembly and extending the franchise to all citizens, with the reservation of a cumulative voting power for property. An important agrarian law of the same year emancipated the peasantry from forced labour. Prince Cuza's agrarian and educational reforms were progressive, but his methods of enforcement were despotic. He alienated the boyars by abolishing forced labour, and the clergy by confiscating monastic estates (see *Religion*, above), while the agrarian reform was not radical enough to satisfy the peasantry.

In February 1866 Cuza was compelled to abdicate, and the principalities by referendum elected as prince, almost unanimously, Charles (*see* Carol I), second son of Prince Charles Antony of Hohenzollern-Sigmaringen, the candidate of Ion Brătianu, who had secured the veiled support of Napoleon III. The new prince reached Bucharest on May 22, 1866, and in July took the oath to a new constitution modeled on the Belgian Charter of 1831, which provided for upper and lower houses and gave the prince an unconditional veto on all legislation. Turkish assent was secured in October; Prince Charles was recognized as hereditary ruler and was allowed to maintain an army of 30,000 men.

1. Internal Politics, 1866–75.—Prince Charles's policy was to avoid all political adventures and to give Rumania a sound administration. The internal situation was at first unsettled; ten governments held office in five years. The dominant figure was the Liberal leader Ion Brătianu.

In 1869 Prince Charles paid a series of state visits to consolidate his position, and married Princess Elizabeth of Neuwied, the poetess later known as Carmen Sylva, who earned great popularity in her adopted country. Prince Charles was a Roman Catholic and his wife a Protestant, but he agreed to bring up his successor in the Eastern Orthodox faith.

Tension arose between the German prince and his pro-French politicians on the outbreak of the Franco-German War in 1870 and there was an abortive attempt to overthrow him in a revolutionary outbreak at Ploeşti. Anti-German feelings were increased by a scandal in the new Rumanian railways; the German contractor failed to honour the coupons of the bonds, mainly held by influential Germans, and the Prussian government attempted to coerce the Rumanian government into payment. Indignation in Rumania culminated in a mob attack on the German colony in Bucharest in March 1871, and Prince Charles contemplated abdication. A Conservative government formed under Lascăr Catargiu succeeded in restoring order, however, and retained office for five years. After another crisis threatening Prince Charles, the Liberals again took office in 1876 and Brătianu became premier; he enjoyed almost absolute power for the next 12 years.

2. The Russo-Turkish War, 1877–78, and the Treaty of Berlin.—Domestic problems were temporarily eclipsed by the reopening of the Eastern Question in 1877. Russia rejected Rumania's offer of cooperation on equal terms against Turkey and threatened occupation. On April 16, 1877, Rumania signed a secret convention allowing free passage to the Russian armies, while the tsar promised to respect Rumanian territory. The Russians crossed the Rumanian frontier in April, and on May 11 Rumania declared war on Turkey. Rumanian troops contributed materially to the joint victory at Plevna (Pleven; *q.v.*), which left the Russian forces free to march on Constantinople. Nonetheless Russia refused to admit Rumanian representatives to the peace negotiations at Adrianople and later at San Stefano. The Russians insisted on the handing back of southern Bessarabia which had been restored to Moldavia after the Crimean War, and despite bitter Rumanian protests this provision was incorporated in the Treaty of Berlin (July 13, 1878); Rumania received an alternative outlet to the mouths of the Danube in northern Dobruja, a territory with little or no Rumanian population, the possession of which later caused discord with Bulgaria.

The treaty recognized Rumanian independence and guaranteed absolute freedom of worship without loss of political rights. The latter article (XLIV) caused indignation in the country and could not be implemented without constitutional revision. Art. VII of the 1866 constitution stated that "only Christians can become citizens of Rumania," thus excluding Jews from civic rights. Jews had not been numerous in the principalities until the early 19th century, but their influx after the Treaty of Adrianople had caused the safeguard to be put into the constitution. Under pressure from the powers, Art. VII was finally repealed.

3. Independence of Rumania: the Kingdom.—The independence of Rumania was recognized by Italy in December 1879 and by Great Britain, France, and Germany in February 1880. Prince Charles, having no children, regulated the succession in 1880 in favour of his nephew Prince Ferdinand of Hohenzollern, and the idea of making Rumania a kingdom was mooted. The Liberal government, accused by the Conservatives of republican tendencies, itself took the initiative in proclaiming the kingdom. This action was hastened by the general fear of revolution consequent on the assassination of Emperor Alexander II. Charles was crowned king on May 22, 1881, and secured the immediate recognition of the powers.

4. Internal Politics, 1878–1912.—Since 1876 Brătianu had exercised almost dictatorial power. His Liberals stood for the rapid development of a strong middle class able to control the Jews, and were mainly Francophile. The Conservatives were divided into the old boyar group, which tended to look to Russia, and the so-called Young Conservatives, the Junimists, led by Petre Carp, who had studied in Germany rather than France and favoured the Central Powers. Brătianu retired after electoral defeat in 1888, and died three years later. Thereafter various Conservative and Junimist administrations held office, the Liberals under Dimitrie Sturdza returning to power in 1895.

The country was in considerable financial difficulties and there was much discontent, particularly in the countryside where the peasants, though emancipated in 1864, were forced by poverty into the hands of Jewish moneylenders. A serious peasant rising in 1907, stimulated by the Russian upheaval of 1905, attacked first the Jews and then the large landowners. The Conservative ministry had to resign and it was a Liberal government which restored order. In 1909 the Liberal leader Sturdza resigned and was succeeded by Ionel Brătianu, eldest son of the great statesman, who continued to base his policy on the expansion of the urban middle class, though some of his younger colleagues concentrated on the agrarian problem. The Conservatives under Carp came to power again in 1911, but were violently attacked by the Liberals and a group of Conservative dissidents formed after the peasant rising under Take Ionescu. Under the pressure of foreign events the cabinet was reconstituted in 1912 with Titu Maiorescu as premier and Ionescu as minister of the interior. In January 1914 Ionel Brătianu succeeded Maiorescu and formed a Liberal administration; together with the party theorist Constantine Stere, a Bessarabian boyar who had been banished to Siberia for his radical views, he worked out a program of agrarian reform.

5. Foreign Affairs, 1878–1912.—The foreign political situation remained comparatively calm between the Treaty of Berlin and the outbreak of the Balkan wars, though Rumania's relations with its neighbours could not be cordial. Bulgaria, a traditional friend, was embittered by the loss of northern Dobruja; against Russia the Rumanians were incensed by the forced retrocession of southern Bessarabia. The resentment aroused against Austria at the end of the 18th century by its seizure of Bukovina, the first home of the Moldavian principality and repository of its chief artistic and ecclesiastical treasures, had died down, but ill feeling was aroused by the commercial treaty of 1875, which Rumania considered unfair, and was intensified by Austria's insistence on having a delegate on the Danube commission, though the commission's writ only ran from Galaţi to Orşova and did not reach Austrian soil. The oppressed Rumanians of Transylvania had been increasingly conscious of grievance against Hungary since 1848 and their feelings were shared in Rumania. With Greece there was a constantly reviving dispute in which Bulgaria was also involved, concerning the status of the Vlach communities in Macedonia over which Rumania claimed the rights of a protector; this caused a diplomatic rupture between Rumania and Greece from 1905 to 1911.

King Charles had a natural and pronounced preference for the Central Powers, and in this he was supported by Ion Brătianu, whose fear and dislike of Russia after the Treaty of Berlin outweighed his Francophilia. It was Brătianu, with Sturdza as foreign minister, who signed the secret treaty of 1883 with Austria and Germany. The treaty, remaining a close secret, was formally renewed under a Conservative administration in 1892. It was, however, the first signatory, Sturdza, leader of the Liberals since 1893, who was most active in support of the claims of the Transylvanian Rumanians against Hungary. The Bosnian crisis of 1908 alarmed Rumania because it showed that Austria was prepared to further the fortunes of Bulgaria in order to destroy Serbia. Ionel Brătianu, however, on succeeding Sturdza in 1909, remained faithful to the secret treaty.

6. First Balkan War, 1912.—The outbreak of war between the Balkan League and Turkey in October 1912 found the Conservatives in office. Rumania's sympathies were at first uncertain; the secret Serbo-Bulgarian military convention of March 13, 1912, had provided against a possible Rumanian attack. The rapid success of the Bulgarians caused Rumania to abandon its original profession of disinterestedness and to stake a claim. Rumania intimated to Bulgaria that in the event of a partition of European Turkey it would, in the interests of the balance of power in the Balkans, require a frontier rectification in the Dobruja. Stoyan Danev, the Bulgarian foreign minister, returning through Bucharest from a visit to Vienna and Budapest, offered only minor frontier rectifications, excluding Silistra, which was the kernel of Rumania's claims. He did, however, consider the renunciation of Bulgaria's claim to northern Dobruja and the giving of a guarantee for the Vlachs of Macedonia. No agreement was reached in Bucharest or in London in January 1913. The case was finally submitted for arbitration to the Conference of St. Petersburg (May 1913) which assigned Silistra to Rumania. Bulgaria regarded the concession as excessive and Rumania no longer looked on it as a satisfactory price for neutrality.

7. Second Balkan War, 1913.—Bulgaria's attack on its allies on June 28, 1913, was used by Rumania as a pretext for intervention. The Rumanian Army, 500,000 strong and commanded by the crown prince, crossed the frontier (July 11), occupied southern Dobruja, and advanced on Sofia. Negotiations were immediately opened at Bucharest, where an armistice was signed on July 30, 1913, between Rumania, Serbia, Greece, and Bulgaria. By the Treaty of Bucharest, signed on Aug. 10, Rumania obtained southern Dobruja which it had already occupied.

Rumania's position was now precarious in view of the growing tension between Vienna and St. Petersburg. The king renewed the secret treaty with the Central Powers at the beginning of 1914 and Austria made great efforts to win Rumanian friendship, but popular sentiment ran the other way. The feeling of kinship with Transylvania grew steadily among the younger generation, while Austria's continued diplomatic support of Bulgaria aroused resentment. The growing feeling of the need for a policy covering the interests of the entire Rumanian nation, within and without the national frontiers, led to a new inclination toward Russia. Though Russia held Moldavian Bessarabia, Austria-Hungary, as arbitrator of the destinies of the much more highly developed Rumanian communities in Transylvania, was the greater obstacle to the realization of dreams of unity. The visit to St. Petersburg of Prince Ferdinand, heir to the throne, in March 1914 and of the emperor Nicholas II to Constanţa in June, did not bring about a definite change of policy, however.

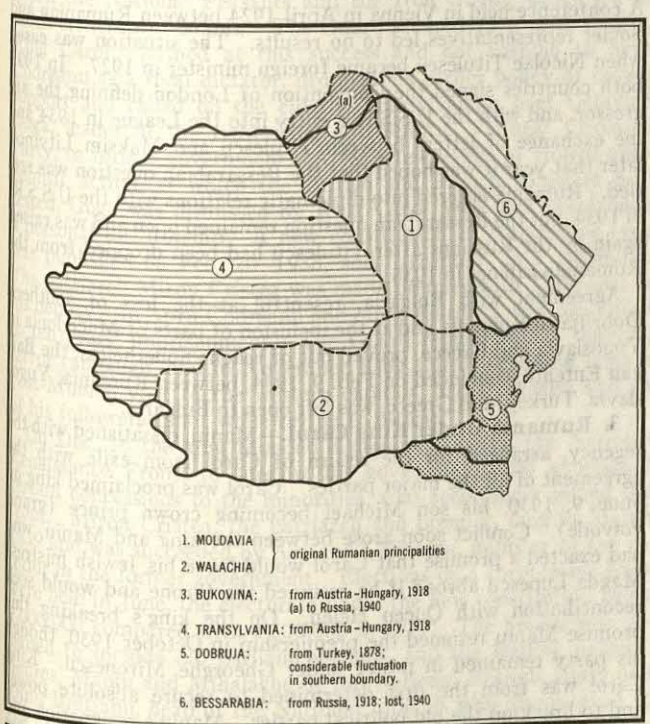
8. Rumania and World War I.—On the outbreak of war in 1914 Ionel Brătianu and his Liberal Party were in office. The politicians were divided in their views, not along party lines, and Rumania at first maintained armed neutrality, though tempted by the Central Powers with the promise of the return of Bessarabia and by the Allies with the offer of Transylvania. Grief at the country's failure to honour the secret alliance hastened King Charles's death in October 1914. His successor, Ferdinand, had married Marie of Edinburgh, granddaughter of Queen Victoria and of Alexander II, stronger in character than her husband and a staunch lover of Britain and Russia. Her influence, Allied promises, and alarm at the extent of German victories finally brought Rumania into the war. By a treaty of Aug. 17, 1916, Great Britain, France, Russia, and Italy guaranteed Rumania the Banat, Transylvania, the Hungarian plain up to the Tisza River, and Bukovina as far as the Prut River. Rumania declared war on Austria-Hungary on Aug. 27; its troops at once crossed the passes into

Transylvania, but were expelled by mid-November. Bucharest was occupied by the Central Powers on Dec. 6, 1916. The king and his ministers and Parliament had already retired to Iaşi and were followed by the Army, which reorganized in Moldavia under the shelter of the Russian forces. The Russian Revolution of February 1917 led to the collapse of the front and left the German Field Marshal August von Mackensen free to throw all his forces against the Rumanian Army, which was rendered incapable of further resistance after a prolonged stand at Mărăşeşti (Aug. 16, 1916), Mărăşti, and Oituz. After the October Revolution the Russian Army disintegrated into pillaging bands, hostilities were suspended and an armistice was concluded on Dec. 6, 1917, at Focşani.

During this period the Parliament in exile at Iaşi was busy with projects of agrarian and electoral reform. Brătianu had already been considering these topics in 1914, and in December 1916 he made a coalition with Take Ionescu and his dissident Conservatives, who had been concerned with the peasant question since the 1907 rising. The effects of the Russian Revolution in the Ukraine and Bessarabia, where the peasants had appropriated the land, made the question urgent. King Ferdinand was personally concerned and induced the Conservatives to agree to a project of radical expropriation, which was passed in July 1917.

9. The Treaty of Bucharest.—After Brătianu resigned on Feb. 9, 1918, Gen. Alexandru Averescu was charged with the peace negotiations at Buftea, near Bucharest. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which it had lost in 1913, while the Central Powers administered the northern half conjointly. Rumania was to have a trade route to the Black Sea via Constanţa. The old frontier of Hungary was restored. The Central Powers secured such terms on the Danube, in the Rumanian oil fields, and over the railways as would have placed Rumania in a state of economic slavery to them for many years. Averescu's cabinet hesitated to sign and resigned on March 12 in favour of the pro-German Alexandru Marghiloman ministry, which signed the treaty at Bucharest on May 7, 1918.

Marghiloman's ministry struggled against almost unsurmountable difficulties throughout the succeeding months. The Central Powers forced the Banque Générale to issue 2,500,000,000 lei in paper money. This disorganized the finance of the kingdom, while economic ruin was ensured by the forced export of sheep and cattle, the cutting down of forests, and the dismantling of factories. The population meanwhile was starving, and the morale of the working class was being perverted by revolutionary propaganda.



THE GROWTH OF RUMANIA, SHOWING TERRITORIAL CHANGES IN THE 19TH AND 20TH CENTURIES

On Nov. 8, 1918, when the defeat of the Central Powers was assured, the king called to power General Coandă, who repealed all laws introduced by the Marghiloman ministry and decreed universal, obligatory, and secret suffrage for all male voters over 21 years of age. War was declared again on Nov. 9. The king reentered Bucharest (Nov. 30) after the German troops had evacuated Rumania under the terms of the Armistice. Ionel Brătianu again became premier on Dec. 14.

E. Greater Rumania

The dream of greater Rumania was realized, but it was no easy task to unite provinces which had been under the domination of different alien states. Bessarabia (*q.v.*) was already incorporated in the old kingdom, having abandoned an earlier idea of autonomy. Its council voted for unconditional union on Dec. 9, 1918. The incorporation of Transylvania (*q.v.*) followed in virtue of a resolution passed by a Rumanian assembly at Alba Iulia on Dec. 1, and that of Bukovina (*q.v.*) on Nov. 28. The government had to carry on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the agreement of August 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea (Nagyvárad), and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Rumanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further neutral zone was established, and Rumania was given the right of occupying it. Béla Kun's Communist government which then came into power in Hungary started a campaign as a result of which the Rumanians advanced to the Tisza River, where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive, but the Rumanian Army defeated his troops, crossed the Tisza—despite the interdiction of the Allies—and occupied Budapest on Aug. 4. There they remained, in the face of numerous protests, until Nov. 14. The treaties of Saint-Germain and Trianon recognized as Rumanian the predominantly Rumanian territories of the old Dual Monarchy, and the Treaty of Neuilly sanctioned Rumanian possession of southern Dobruja.

1. Domestic Politics, 1919–30.—The political scene was transformed after 1918; the old Conservative Party was swept away because of its pro-German policy and the impoverishment of its chief supporters, the boyars. The Liberals became the party of the business and professional classes, while the peasants, who gained new status through the land reform, founded a party of their own in the old kingdom headed by Ion Mihalache. More radical elements came in from Transylvania, notably the National Popular Party headed by Iuliu Maniu and Alexandre Vaida-Voevod. The Socialists were not influential, as more than 80% of the population of Rumania were peasants; in the old kingdom the Socialists were mainly Marxist and supported the Russian Revolution, but in Transylvania they looked to the West.

The new parties had their chance as early as December 1919 in a coalition cabinet headed by Vaida-Voevod, the Brătianu government having resigned in protest against the minorities clause of the Treaty of Trianon (Art. LX), but their tenure of office was short. General fear of Communist propaganda and the alarm of the landowners at the proposed expropriation led to the government's resignation in March 1920 and the return of a new People's Party containing many former Conservatives, led by General Averescu, hero of two wars.

He secured the able Take Ionescu as minister of foreign affairs. The general, despite personal sympathy with the peasants, had to take strong measures to restore order. A revolutionary movement was breaking out on the Dniester and securing support among Socialists and Communists in the old kingdom, and social tension reached a climax in the general strike of October 1920. The failure of the strike split the Rumanian Socialist movement. The more moderate leaders were imprisoned, and the Communists, who had kept underground, gained the upper hand. They voted for the affiliation of the Social Democratic Party with the Comintern at a congress in May 1921, whereupon 70 leaders were arrested. The Social Democrats thereafter kept separate,

and the newly formed Communist Party was outlawed in 1924.

Meanwhile Averescu had to put through the promised land reform. The bill was introduced in the spring of 1921 by the minister of agriculture, Constantin Garoflid, himself a large landowner. After impassioned controversy, expropriation was put through on the lines agreed in July 1917, estates being limited to 500 ha. in the old kingdom, and to much smaller areas in Bessarabia and Bukovina. The peasants were not wholly satisfied; the holdings allotted were often unduly small and there was no adequate arrangement for the granting of credits for the purchase of seed and tools. (By 1934 less than 1,500,000 peasant families had been granted land, and there were still 700,000 landless peasants.)

The Liberals came to power at the beginning of 1922, remaining in office with one short break until 1928. Brătianu dominated the scene until his death in 1927 and thus had the satisfaction of being in office for the coronation of King Ferdinand as sovereign of united Rumania at Alba Iulia on Oct. 15, 1922.

A new constitution was adopted in March 1923 based on that of 1866 but with the addition of manhood suffrage. The Jews were given citizenship rights, but their inflow in large numbers after World War I provoked violent hostility. In the financial sphere the Liberal government pushed through the difficult policy of coupling industrialization with the exclusion as far as possible of foreign capital, which bore heavily on the peasants who had to pay for it by export duties. The chief cause of Liberal unpopularity, however, was the centralization of administration. All the new provinces, even including backward Bessarabia, had hoped for a measure of autonomy, and this feeling was strongest in Transylvania where bitter hostility was aroused by the arrival of officials from the old kingdom. The minorities problem was to prove troublesome to all Rumanian administrations in the years following World War I, and none succeeded in finding a solution.

Brătianu proceeded in 1926 to push through an electoral law giving great advantages to the party in power at election time. By this law those who secured 40% or more of the votes were given half the seats in the chamber, plus a share in the remainder in proportion to the number of votes obtained. When a ministry fell as a result of an adverse vote in the chamber, the king could call on the leader of the next largest party to form a cabinet and hold elections. Until 1937 no party in charge ever failed to secure the necessary 40%. The Liberal Party's popularity was slowly waning at the end of 1925, and in the face of growing discontent King Ferdinand again called on General Averescu to form a cabinet. His party, with some peasant support, secured four-fifths of the seats in the chamber in the elections of March 1926, largely because of successful pressure at the polls. Though the Liberals only had 16 deputies it was clear that the new administration governed largely with their support. Meanwhile the opposition was greatly strengthened by the fusion, in October 1926, of Maniu's National Popular Party with Mihalache's Peasant group to form the National Peasant Party, which was to represent the majority of the Rumanian people. Averescu resigned in June 1927 and Brătianu was again returned; the newly formed National Peasant Party, despite universal popularity, polled only 22% of the votes in the obviously manipulated elections.

The political situation was complicated by the dynastic position. In December 1925 Crown Prince Carol (*see* CAROL II) was forced to leave Rumania, renouncing all his rights in favour of his young son Michael. In view of King Ferdinand's precarious health a council of regency was formed in January 1926 consisting of the patriarch Miron Cristea, the president of the supreme court Gheorghe Buzdugan, and the king's second son, Prince Nicholas.

King Ferdinand died on July 20, 1927, and Brătianu died in November of the same year. The Liberal Party, thus weakened, was faced with an economic crisis and peasant demonstrations. The regency council in November 1928 entrusted Maniu with forming a government and holding elections: on Dec. 12, in the first and, so far, only free elections in Rumania, his National Peasant Party was returned with a majority of 349 seats out of 387. The new government abolished censorship and martial law, mitigated the police regime, promised concessions to the minorities, and in June 1929 introduced, to the great satisfaction of the Transylvanians, an administrative reform bill aiming at extensive decentralization. The peasants were helped by the repeal of the export duties; cooperatives were encouraged and free sale of land allowed, a measure which unfortunately led to an increase of the rural proletariat rather than to a consolidation of prosperous peasant holdings as had been intended. The economic situation was greatly eased by the entry, at last allowed, of foreign capital.

2. Foreign Policy, 1920–37.—Rumania's foreign policy after Trianon was necessarily based on an endeavour to maintain the *status quo* and to protect itself against aggression. Rumania was from the first a consistent member of the League of Nations, but built up a careful system of regional pacts to buttress collective security. The first such pact was concluded with Poland in March 1921, when Take Ionescu and Prince Eustachy Sapieha signed a treaty providing for mutual assistance in the event of unprovoked attack on the eastern frontier. Both countries were threatened by the U.S.S.R., which had not recognized Rumania's right to Bessarabia and seemed little satisfied with Poland's possession of its former Ukrainian and Belorussian territories.

Take Ionescu had hoped to form a Baltic-Aegean bloc to act as a buffer between Germany and the U.S.S.R., but had to be content with joining the Little Entente (*q.v.*) system. An agreement with Czechoslovakia for mutual protection against Hungary was signed in April 1921 and with Yugoslavia for similar protection against Hungary and Bulgaria in June. He sought further to cement Balkan friendships by dynastic alliances. Marriages were concluded between Crown Prince Carol and Princess Helen of Greece (March 10, 1921), between his elder sister Princess Elizabeth and the crown prince of Greece (February 1921), and between Princess Marie and King Alexander I of Yugoslavia (June 8, 1922).

General Averescu, in his 1926–27 administration, extended Rumania's system of pacts to include its "Latin sisters." A treaty of alliance and nonaggression was signed with France in June 1926 and another in September of that year with Italy. The Italians, after long hesitation, recognized the incorporation of Bessarabia in Rumania in March 1927. Relations with the U.S.S.R. remained in a state of tension; during 1924 the Soviet Union kept up continuous agitation and threats of war, even setting up a three-day Communist republic at Tătăr Bunar in southern Bessarabia. A conference held in Vienna in April 1924 between Rumanian and Soviet representatives led to no results. The situation was eased when Nicolae Titulescu became foreign minister in 1927. In 1933 both countries signed the Convention of London defining the aggressor, and with the U.S.S.R.'s entry into the League in 1934 and the exchange of letters between Titulescu and Maksim Litvinov later that year it was hoped that the Bessarabian question was settled. Rumania entered into diplomatic relations with the U.S.S.R. in 1934, but the Bessarabian question remained open and was raised again by the Russians after Titulescu had been dropped from the Rumanian cabinet in 1936.

Agreement with Bulgaria, resentful at the loss of southern Dobruja to Rumania and at the inclusion of parts of Macedonia in Yugoslavia and Greece, proved out of reach; nonetheless, the Balkan Entente, concluded on Feb. 9, 1934, between Rumania, Yugoslavia, Turkey, and Greece, was left open to Bulgaria.

3. Rumania Under King Carol.—Maniu, dissatisfied with the regency, arranged for the return of Carol from exile with the agreement of all the major parties. Carol was proclaimed king on June 9, 1930, his son Michael becoming crown prince (grand voivode). Conflict soon arose between the king and Maniu, who had exacted a promise that Carol would leave his Jewish mistress Magda Lupescu abroad if he resumed the throne and would seek reconciliation with Queen Helen. On the king's breaking this promise Maniu resigned the premiership in October 1930, though his party remained in power under Gheorghe Mironescu. King Carol was from the first determined to secure absolute power and to break up the old political parties. Maniu's resignation and the world economic crisis helped to bring down the National Peasants in 1931. After Mironescu's resignation the foreign

minister Titulescu attempted to form a cabinet, and on his failure the king appointed one of his own choice headed by his former tutor Nicolae Iorga. The elections of June 1931 gave the government a majority of 291 seats out of 387, but it resigned a year later. The National Peasants had a brief return to power and it fell to Vaida-Voevod to deal with the serious Communist-inspired railway strike at Grivița in February 1933, but the party, split through King Carol's intrigues, could no longer keep itself in power. The Liberal opposition was also split; the leaders Ionel Brătianu and his brother Vințila were dead and the third brother Constantin (Dinu) had not their grip over the party, while their nephew Gheorghe was on the king's side. Nevertheless the Liberals returned to power in 1933 under an anti-Carol leader Ion Duca.

4. Rise of the Iron Guard.—The king was helped in his disruption of the older parties by the rise of a new group of fascist type which was taking shape in Moldavia, feeding on endemic Rumanian anti-Semitism and the economic crisis. The leader, a young man named Corneliu Zelea-Codreanu, first called his group the Legion of the Archangel Michael; later it had many names, the best known being the Iron Guard. Priests, officers, and students flocked to Codreanu's standard; the party had a mystical appeal and its leaders wore the trappings of romance. Its slogan was the Christian and racial renovation of Rumania: in foreign affairs it opposed cooperation with France, the U.S.S.R., or the League of Nations and sympathized with Germany and Italy and later with Francisco Franco in Spain; at home it tempted the peasants with the slogan *omul și pogonul*—"one man, one acre."

The Iron Guard gained its first five seats in Parliament in 1932; its policy of violence, which had already been demonstrated by the murder of the prefect of Iași, was carried forward by the assassination of the premier Duca, on Dec. 30, 1933, a month after he had assumed office. Unlike the neighbouring Balkan states Rumania had not in modern times been prone to political murders and the country was profoundly shocked. The new Liberal premier Gheorge Tătărescu proscribed the Iron Guard, but reappearing under another name—*Totul Pentru Țara* ("everything for the country")—it succeeded in securing Titulescu's removal from the foreign ministry in August 1936.

In the 1937 elections, presided over by Tătărescu, the government for the first time failed to secure the necessary 40% of the votes. It was highly unpopular, and the opposition was unexpectedly consolidated by the conclusion of an electoral pact between the National Peasants and the Iron Guard, which led to much criticism of Maniu. The Guard secured 16% of the votes. King Carol, alarmed at this success and not wishing to have Codreanu as a rival dictator, dropped his earlier policy of covert support and called on the elderly Transylvanian poet Octavian Goga, leader of the right wing anti-Semitic National Christian Party, to form a government. After a few weeks of violent anti-Semitic action, at which the British and French ministers protested, Goga was dismissed by King Carol, who then proclaimed a personal dictatorship. A new constitution of corporative type was published on Feb. 20, 1938, and "accepted" in a plebiscite. The patriarch Miron Cristea was made premier with Tătărescu as his deputy. In April Codreanu and other guardists were sentenced to ten years' imprisonment. The Guard replied with a renewed terror campaign, and in November King Carol, returning from a post-Munich visit to the western capitals, had Codreanu and 13 of his followers "shot while trying to escape."

On Dec. 16 the king founded a monopoly party, the National Renaissance Front, to support his government, and announced certain concessions to the minorities, who accordingly joined the front. Miron Cristea, the patriarch and premier, died in March 1939 and was succeeded by Armand Călinescu, minister of the interior in the former government. Elections on a corporative basis were held in June, the electorate under the new constitution being 2,000,000 compared with 4,500,000 in 1937. The Senate was designed to include old parliamentarians, and the leading political figures, Maniu and Mihalache of the National Peasant Party and Dinu Brătianu, head of the National Liberals who disapproved of the Tătărescu faction, automatically became members. They refused, however, to take the oath to the new constitution, and were suspended. Women could vote and, for the first time in Rumanian history, stand as candidates, but only for the Senate. The Iron Guard continued to foment unrest during the summer of 1939 with German backing and on Sept. 21 murdered Călinescu; after the brief premiership of Gen. Gheorghe Argeșanu, who was able to secure some degree of public order, Constantin Argetoianu became premier for two months and was then succeeded by Tătărescu.

5. Foreign Policy, 1938–39.—The annexation of Austria and the sacrifice of Czechoslovakia in 1938 overthrew the whole system of Rumanian foreign policy. Relations with Italy were already embittered through Rumania's adopting sanctions at the League's bidding during the Abyssinian War, and the pact with Italy had lapsed in 1936. Rumania had been ready to fulfill its obligations under the Little Entente and to come to the aid of Czechoslovakia during the Munich crisis, even secretly agreeing to allow Soviet troops to cross its territory. The Polish alliance stood, even after Munich, but Rumania refused Poland's offer of a slice of Czechoslovak territory in Ruthenia in October 1938. Confidence in the west had been shaken by Munich, and in March 1939 a trade treaty was signed with Germany designed to put the whole of Rumania's economic life at German disposal. The new foreign minister, Grigore Gafencu, made a last attempt to seek support in the west, securing a Franco-British guarantee of Rumanian territorial integrity on April 13, 1939. Rumania's only real hope, however, lay in German-Soviet antagonism, and that was shattered by the anti-Polish Ribbentrop-Molotov agreement in August.

6. World War II.—The invasion and dismemberment of Poland in September 1939 found Rumania powerless to help its ally; Rumania declared neutrality on Sept. 4. The collapse of France in the summer of 1940 removed the last prop of Rumanian morale; nonetheless, King Carol made efforts to put the Army on a war footing and announced that the country's frontiers would be defended at any cost. Under German pressure the foreign minister, Grigore Gafencu, was forced to resign and was succeeded by the strongly pro-German Ion Gigurtu. On June 21 the king agreed to turn the National Renaissance Front into a still more totalitarian national party which included Iron Guardists, under Horia Sima, released on German orders.

The first blow fell on June 27 when in agreement with Germany the U.S.S.R. occupied not only Bessarabia but northern Bukovina, which had never been in Russian possession. Rumania was forced to accept, renounced the British guarantee on July 2 and on July 4 appointed a new pro-German cabinet with Gigurtu as premier and Horia Sima as minister of culture. On July 16 Germany was "invited" to send a military mission. Hungary now had to be conciliated. In order to prevent Hungary from going to war to win back Transylvania (thereby inviting Russia into Rumania in force), Germany and Italy imposed on Rumania the conditions that came to be known as the Vienna Award. Ribbentrop and Count Ciano, the Italian foreign minister, were sent by Hitler to meet with the foreign ministers of Hungary and Rumania. On Aug. 30, at the Belvedere Palace in Vienna, it was agreed that northern Transylvania (about 16,830 sq.mi. [43,588 sq.km.]) was to be handed over to Hungary. This was an especially bitter blow to Rumanian patriotism. (When the Allied-Rumanian armistice was negotiated in 1944, the restoration of "all or the greater part" of the territory lost in 1940 was included in the agreement.)

The people wished to fight and looked for a lead to Maniu, the grand old man of Transylvania. While he hesitated the Iron Guard, despite their pro-German attitude, led the national protest and demanded the abdication of King Carol, who was made the scapegoat. The king left on Sept. 6 with Magda Lupescu, leaving his 19-year-old son, Michael, on the throne as Mihai I. Before his departure he entrusted power to a general, Ion Antonescu, who formed a government consisting largely of Iron Guardists, with Horia Sima as vice-premier. The constitution was suspended and Antonescu given full powers. Meanwhile Bulgaria, with German support, had been agitating for the return of southern Dobruja; the agreement for its cession was signed at Craiova the day after Carol's departure. Rumania lost about 3,500,000 subjects to the

U.S.S.R., 2,400,000 to Hungary, and 360,000 to Bulgaria. Germany and Italy guaranteed rump Rumania. Rumania was declared a "national legionary state" on Sept. 15 and joined the anti-Soviet Tripartite Pact on Nov. 23.

German troops had been pouring into the country since September, but as the Germans had decided to reduce Rumania to complete subservience by playing off the Iron Guard against Antonescu, the *Wehrmacht* stood by when the guardists staged a St. Bartholomew's night on Nov. 28 in which 64 prominent members of the old regime were assassinated, including Iorga and the peasant leader Virgil Madgearu. Antonescu now secured German support in putting down the Guard, which staged a more serious rising at the end of January 1941 under the leadership of Sima, vice-premier in Antonescu's cabinet, and Ion Codreanu, father of Corneliu.

The revolt was finally suppressed with about 6,000 casualties; Sima escaped. The new administration formed at the end of January was mainly military, all guardists being excluded. About 500,000 German troops were in the country by February, and on Feb. 10 Great Britain broke off diplomatic relations. Antonescu refused to join Adolf Hitler in smashing Rumania's ally Yugoslavia in April 1941, but the country was behind him in entering the war against the U.S.S.R. as Germany's ally on June 22. Great Britain declared war on Rumania on Dec. 7 and on Dec. 12 Rumania declared war on the United States.

Rumania's recovery of Bessarabia in the summer of 1941 was highly popular in the country, but the opposition leaders underground, in particular Maniu, strongly disapproved of the Army crossing the Dniester into Soviet territory in 1942 and of the organization of a new Rumanian province beyond the river known as Transnistria. The nation, however, did not become thoroughly war weary until the disastrous casualty lists came in from Stalingrad.

7. The Communist Regime.—Although Rumania had not had a parliamentary government since 1938, the chief political parties had kept their organizations intact: the National Peasants under Maniu and the Liberals under Dinu Brătianu formed a rallying point for popular discontent with the fruits of Antonescu's pro-Axis policy and undertook secret negotiations with the Allies during 1943. These parties were supported in the desire for an armistice by the pro-Soviet left, namely the Social Democrats under Constantin Titel Petrescu and the Communists under Lucreţiu Patraşcanu. In the spring of 1944 the four parties agreed to form a National Bloc to bring Rumania out of the war.

The *coup d'état* of Aug. 23, 1944, which overthrew Antonescu and brought Rumania into the war against Germany, was largely the work of King Michael himself, supported by the National Peasants and Liberals, but the Social Democrats and Communists were given representation out of proportion to their numbers in the first postarmistice administration. The armistice was signed in Moscow on Sept. 12, Soviet troops having been in occupation of Rumania since the end of August. The peace treaty subsequently provided for their remaining until after the conclusion of the Austrian treaty, a period that would ensure their presence while Rumania was being remodeled on the Soviet pattern. The Russians had prepared during the war a division of indoctrinated Rumanian prisoners named after the hero of 1821, Tudor Vladimirescu; these marched into Rumania beside the Red Army.

Internal Affairs.—Until elections could be held, three short-lived governments of a mainly military character took office, the first two headed by Gen. Constantin Sănătescu (1885–1947) and the third by the chief of staff, Nicolae Rădescu (1874–1953), an open anti-Communist. The Soviet deputy foreign minister, Andrei Vyshinski, went in person to Bucharest to insist on Rădescu's removal and the installation as premier of Petru Groza, head of a splinter left-wing party known as the Plowmen's Front which, though not forming part of the National Bloc, had been included under Soviet pressure in the last Sănătescu administration.

The Groza government, which took office in March 1945, excluded the National Peasants and the Liberals and proved highly unpopular. In August of that year the Potsdam Conference of U.S., British, and Soviet leaders proposed the resumption of diplomatic relations with Rumania provided that the government was "recognized and democratic." The U.S.S.R. immediately resumed relations, but Great Britain and the United States refrained on the ground of the unrepresentative nature of the administration. King Michael then appealed to the three powers, which, meeting in Moscow in December 1945, advised that a government, broadened by the inclusion of a National Peasant and a Liberal member, should hold elections. (Antonescu was shot as a war criminal in 1946.)

The 1923 constitution had been restored after the armistice, but before the elections a law was passed abolishing the Senate. The government bloc announced that it had polled 71% of the votes in the elections held on Nov. 19, 1946. The Communists secured the key portfolios in the new government, excepting that of foreign affairs (which was given to Tătărescu), and split the Social Democrats, the bulk of the party remaining aloof under its leader Petrescu, who was later imprisoned. The elections were followed by a wave of arrests of former leaders and their supporters, including Maniu, Brătianu, and Petrescu. The National Peasant Party, which had the allegiance of the majority of Rumanians, was declared illegal in August 1947, and Maniu himself was tried and condemned to life imprisonment on Nov. 11; he died in prison in 1953. Evidence given at his trial was used as a pretext for removing Tătărescu from the ministry of foreign affairs, Ana Pauker, Moscow-trained, taking his place.

In December 1947 King Michael was forced to abdicate. In February 1948 the remnant of the Social Democrats under Lothar Radaceanu (d. 1955) merged with the Communists to form the Rumanian Workers' Party (Partidul Muncitoresc Român), which, together with the Plowmen's Front and the Hungarian People's Union, presented a single list as a People's Democratic Front in the ensuing elections. The front claimed 405 out of 414 seats in the Grand National Assembly elected on March 28, 1948. A constitution of Soviet type was adopted in April and the Rumanian People's Republic proclaimed, with Constantin Parhon as first president. The Communist Party purged itself by 18% during 1949; by the middle of 1950, after the admission of new members, the total membership was put at 720,000. The wartime Communist leader Lucreţiu Patraşcanu, dismissed from the ministry of justice and arrested in February 1948, was tried and executed in 1954. In May 1952 three leading Communist ministers, among them Ana Pauker, were purged. Gheorghe Gheorghiu-Dej then became premier, Groza retiring to the presidency vacated by Parhon.

A revised constitution, still closer to that of the U.S.S.R., was adopted on Sept. 24, 1952, and a new assembly elected on November 30. When Groza died in January 1958 he was succeeded by Ion Gheorghe Maurer. On Oct. 3, 1955, Gheorghiu-Dej abandoned the premiership to Chivu Stoica, himself reverting to the first secretaryship of the Rumanian Workers' Party. In March 1961 the National Assembly elected a State Council, a new organ of supreme administration to replace the former Presidium. Gheorghiu-Dej was made president of the council, while retaining his key party post. Maurer became premier in place of Stoica, who became a secretary of the Central Committee of the party. Gheorghiu-Dej died on March 19, 1965; he was succeeded as first secretary of the party by Nicolae Ceauşescu and as president of the State Council by Stoica.

On March 7, 1965, a new Grand National Assembly was elected, only one candidate being presented for each of the 465 constituencies. The congress which the Rumanian Communist (formerly Workers') Party held in Bucharest in July 1965 approved the draft of yet another constitution and new party rules. The party then numbered more than 1,450,000 members and candidates. The new constitution was voted by the Grand National Assembly on Aug. 21.

Foreign Policy.—By the peace treaty, ratified on Sept. 15, 1947, the cession of Bessarabia and northern Bukovina to the U.S.S.R. and of southern Dobruja to Bulgaria was confirmed; in exchange northern Transylvania was restored to Rumania by Hungary.

A treaty of friendship, collaboration, and mutual assistance was signed with the U.S.S.R. on Feb. 4, 1948, and Rumania later

entered into the network of alliances of similar people's republics. In January 1949 Rumania became one of the members of the Council for Mutual Economic Assistance (Comecon) founded in Moscow. On May 14, 1955, in Warsaw, Rumania joined a treaty of mutual assistance concluded by the U.S.S.R. with its seven European satellite states.

Long docile to the U.S.S.R., Rumania took a more defiant line in 1963. Gheorghiu-Dej refused to follow the Soviet example in relations with Communist China or to commit Rumania to overall plans for the Comecon area. In the same spirit Ceaușescu, in May 1966, claimed that the Rumanian Communist Party was continuing the historic struggle waged by the Rumanian people for complete national independence. Symptomatic also were Rumania's friendly relations with France and, in January 1967, its opening of full diplomatic relations with the German Federal Republic.

(B. Br.; X.)

V. POPULATION, ADMINISTRATION, AND SOCIAL CONDITIONS

1. Population.—The population of Rumania has fluctuated with the changes in the extent of the state. In 1914 it was 7,600,000. In 1939, before the losses of territory to Hungary, Bulgaria, and the Soviet Union, total population was estimated to have been 19,930,000. The 1948 census, reflecting the eventual peace settlement, with Bessarabia and northern Bukovina remaining in Soviet possession and southern Dobruja in Bulgarian, gave a total of 15,872,624. The 1956 census recorded 17,489,450 and the 1966 census total was 19,105,056. The birthrate is fairly high, 15.7 per 1,000 (1963), and the rate of population increase rapid.

Population is very unevenly distributed. The greatest densities occur in Muntenia, which includes Bucharest, and in Transylvania; the areas of sparsest population are in the mountains.

The population is predominantly rural, and the 1956 census showed only 31.3% of the total population living in urban centres. Rumania is still essentially a country of peasants. The administrative regions (*regiuni*) of Rumania, with their area and population, are given in the table.

Area and Population of Rumania

Region	Area (sq.mi.)	Population (1963 est.)	Density (per sq.mi.)
Argeș	6,100	1,189,395	195.0
Bacău	5,174	1,103,964	213.4
Banat	8,417	1,241,832	147.5
Brașov	5,826	1,062,481	182.4
București	7,907	1,681,599	212.7
Cluj	6,494	1,217,401	187.5
Crișana	4,726	873,393	184.8
Dobruja	5,969	517,016	86.6
Galați	4,984	1,065,646	213.8
Hunedoara	4,247	656,452	154.6
Iași	4,286	1,052,378	245.5
Maramureș	4,054	782,127	192.9
Mureș (Magyar Autonomous Region)	4,730	814,632	172.2
Oltenia	7,838	1,570,574	200.4
Ploești	5,058	1,460,693	288.8
Suceava	5,309	1,002,883	188.9
Bucharest (city)	735	1,366,794	1,859.6
Constanța (city)	205	153,871	750.6
Total	91,699	18,813,131	205.2

The capital and largest city is Bucharest (pop. [1963] 1,366,794), followed by Cluj (166,428), Constanța (153,871), Timișoara (150,257), Brașov (133,532), Ploești (131,379), Iași (126,865), and Brăila (119,466). The urban population has increased sharply since World War II.

2. Constitution.—The 1965 constitution describes Rumania as a "socialist, sovereign, independent, and unitary state of the working people of the towns and villages." It states that in the republic "the leading political force of the whole society is the Rumanian Communist Party." It adds:

> The Socialist Republic of Rumania maintains and develops relations of friendship and fraternal collaboration with the socialist countries, promotes relations of collaboration with countries having other socio-political systems, and acts in international organizations with a view to ensuring peace and understanding among the peoples. The foreign relations of the Socialist Republic of Rumania are based on the principles of observance of sovereignty and national independence, equal rights and mutual advantage, non-interference in internal affairs.

The constitution ensures to non-Rumanian nationalities "the free utilization of their native language as well as books, papers, magazines, theatres, and education at all levels in their own language." In districts where non-Rumanian nationalities are in the majority, "all the bodies and institutions use the language of the respective nationality in speech and in writing." "Anybody is free to share or not to share a religious belief," but "the school is separated from the church."

The Rumanian people are the "sovereign holder of power" and they exercise this power through the Grand National Assembly consisting of 465 deputies, elected in single-member constituencies, with only one official candidate, for a term of four years. All citizens who have reached the age of 18 years have the right to vote; those who have reached the age of 23 can be elected. The Grand National Assembly elects the State Council, the Council of Ministers, the Supreme Court, and the Procurator General. The State Council is "the supreme body of state power with a permanent activity." It exercises the legislative power in the interval between the cessions of the Grand National Assembly. The latter, or—in case of emergency—the State Council, declares war. According to the Art. XLIII:

> War can be declared only in case of armed aggression directed against the Socialist Republic of Rumania, or against another state toward which the Socialist Republic of Rumania has mutual defense obligations arising from international treaties, if a situation has come about for which obligation to declare war has been laid down.

3. Government and the Party.—The actual government of Rumania is in two parts, the formal part described above, and that of the Rumanian Communist Party which in its organization parallels the constitution, checking and controlling its operation. The RCP is "the highest form of organization of the working class, its vanguard detachment"; it "serves the vital interests and hopes of the people"; it bases its activity "on the Marxist-Leninist teaching, applying it creatively to the specific conditions and particularities" of Rumania. The supreme body of RCP is the party congress meeting every four years and electing the Central Committee of 121 members. The Central Committee "guides the entire activity of the party in the interval between congresses"; it elects the Political Bureau, the General Secretary, and the Secretariat. "Leadership of party activity is ensured between plenary meetings by the Political Bureau," states Art. XXII of the new rules. The latter is the real policy-making body in the country.

Local Government.—For purposes of local government Rumania is divided into 16 regions (*regiuni*) and two cities, Bucharest and Constanța, which are independent of the regions. These are subdivided into 199 counties (*raione*), which in turn are subdivided into a large number of communes. This hierarchy of local government areas is highly centralized, and provides for the downward flow of directives from the central organs of state and party to the local communities. For each administrative unit there is a People's Council with its executive officers, elected for a period of two years. The voting for the People's Councils is by adult suffrage, except that former landowners and capitalists are denied the vote. The resulting councils are made up very heavily of the top echelons of the local Communist Party members.

4. Social Conditions.—Before World War II Rumania had been a predominantly agricultural state, with about 80% of its population living in rural areas. Under such conditions it had proved difficult to organize trade unions. They were small and relatively weak, and their success in improving working conditions had not been great when World War II began. Communists infiltrated the unions to only a small degree. In 1944, the unions were reorganized. Their former Social Democratic members were excluded on account of their alleged collaboration with King Carol, and leadership within the unions quickly centred upon the Communists. Betterment of working conditions and the improvement of the lot of the working class is the policy put forward by the unions. This is now theoretically the preoccupation of the government, which claims in the fullest degree to represent the interests of the proletariat. The function of the unions has now become that of intermediary between the party and the workers; they exist to stimulate the workers and urge upon them greater efforts to implement the national plans. With the different func-

EASTFOTO

VIEW OF RUMANIAN PEOPLE'S REPUBLIC SQUARE, BUCHAREST, SHOWING PALACE HALL AT LEFT AND STATE-FINANCED HOUSING AT RIGHT

tion has come a change in organization. Unions are organized, not by craft or profession, but by region and area. Union members pay their union small dues, generally 1.5% of their earnings. In return it is claimed that they enjoy priorities in the social benefits, such as hospitalization, vacations, and housing, which are dispensed by the state.

Rumania is a welfare state, in that the state itself claims to furnish all social services required by the people. Doctors are employed and paid by the state, and hospitals and health services are run by the state. The people receive medical attention free of payment. All schooling is provided by the state. Public utilities are also in the hands of the state, which is extending such facilities as rural electrification, piped water supplies, and sewage.

5. Justice.—Justice is administered by the Supreme Court, by 16 regional courts and by people's courts at the *raion* level. The courts serving the larger geographical areas serve as courts of appeal from the lower and more local courts, and the Supreme Court, whose judges are chosen by the Grand National Assembly, has a general oversight of the whole judicial system. Most cases are heard by a judge and two people's assessors, but appeals to a higher court are normally heard by three judges. No use is made of a jury. The chief judicial officer of the state is the procurator-general, who is appointed by the Grand National Assembly and is a member of both the Presidium and the Council of Ministers. He combines the roles of attorney general and public prosecutor; he is described as the "defender of socialist legality," which means that it is incumbent upon him to see that every end is consistent with the policies of the state.

6. Education.—The Communists paid a great deal of attention to the problem of providing adequate elementary education for the Rumanian people. Political instruction became compulsory at each educational stage. Education was made completely secular in 1948, with the abolition of private schools, of religious instruction in school hours, and of all the religious orders.

The present educational system consists of kindergartens for children of from three to seven years, primary schools, secondary schools, and centres of technical and higher education. Primary education is both free and compulsory for eight years. At the secondary level students are divided according to their aptitudes between lyceums, normal or pedagogical schools, and technical schools. Fees are payable by students in secondary schools, but scholarships often relieve this burden in poorer families. The greatest emphasis has been placed by the government on the development of the technical schools, in order to train the technicians required by the expanding industry. Colleges of engineering have been established at Bucharest, Timişoara, Craiova, and Iaşi.

The higher education system is made up of four universities, at Bucharest, Iaşi, Cluj, and Timişoara, and a number of technical institutes and schools of music, art, and drama. An important part is also played by the Rumanian People's Republic Academy of Sciences. This is organized in departments and has branches at Iaşi and Cluj, a large number of institutes and research centres, observatories and experimental stations, and a network of libraries.

7. Defense.—The peace treaty between the Allies and Rumania (1942) permitted Rumania to maintain an army of 120,000 men, a small artillery force, an air force of 150 planes, and a navy with an overall tonnage of 15,000 tons. These limitations were soon ignored, under the protection of the Soviet Union, and the Rumanian Army in 1962 consisted of about 200,000 men, with 100,000 more in para-military organizations such as militia and security police. The Navy, though larger than the limits permitted under the treaty, is made up of small and rather old craft, including three destroyers and ten submarines. The Black Sea naval base is Constanţa. There is a Danube flotilla of small military craft, based on Brăila. The Air Force is probably more than twice the permitted size and may have 350 military aircraft; it was reorganized under Soviet supervision and reequipped largely with Soviet planes.

VI. THE ECONOMY

Rumania is one of the less-developed European countries, primarily because of its exposure to invasion and its record of unstable internal politics. The country failed during the 20th century to attract adequate investment capital, and during the 1930s came to be attached to the German economy very largely in the role of supplier of unprocessed farm products. Nevertheless, Rumania has very extensive natural resources. During World War II the oil and grain surpluses were of supreme importance to Germany. Afterward Germany's position was taken by the U.S.S.R., and Rumanian mineral production and industries were at that country's disposal. The Soviet Union took over most foreign assets in Rumania, and special Soviet-Rumanian joint-stock companies, controlled by the Soviet Union, were set up to exploit these assets. In 1954 an agreement was reached for the "sale and transfer" to Rumania of the Soviet share in 12 of these joint companies, and the others, including the petroleum company, came under exclusively Rumanian direction later.

In 1949 Rumania joined the Council of Mutual Economic Assistance. The resulting trade agreements, as well as the two five-year plans (1951–55 and 1956–60) and the overlapping six-year plan (1960–65), contributed to the more rapid expansion of the economy, which became more closely integrated with the economies of the Soviet Union and other Communist countries.

In its internal development Rumania followed the Soviet pattern. The land reform of 1945 prepared the way for the collectivization of agriculture, which started in 1949. After 1947 privately owned industry and privately operated commerce and finance, as well as western types of trade unions, were gradually destroyed. In 1948 all subsoil rights were nationalized, together with all remaining industrial, banking, insurance, mining, transport, and telecommunication undertakings. This was immediately followed by the establishment of a Supreme State Planning Commission and the reorganization of the existing industrial boards into state industrial centres charged with preparing plans for each industrial group. The work of these groups culminated in the publication of the first five-year plan for capital investment and for the increase of all branches of production. The results of this early planned development were seen in the continued scarcity of food and other consumer goods and the failure of working and living conditions to improve. The second five-year plan saw a considerable increase of industrial production and an improvement of living standards. This process continued during the six-year plan.

A. Production

1. Agriculture.—About four-fifths of the labour force of Rumania was engaged in agriculture and forestry before World War

II, and the proportion still exceeded two-thirds in the early 1960s. The farming areas fall into several natural regions: (1) the Carpathian Mountains are given over mainly to forestry, but are noted for the old-established summer pastures—the *plaiu*—above the timber line. These mountain sheep pastures are the basis of the home wool production which is adequate for the manufacture of the peasants' coarse woolen garments. The Carpathian settlements are of the characteristic line type, often strung out for five or six miles along the valleys; the houses have high-pitched roofs and thick carved beams; (2) Transylvania, an upland, hilly country with forest and a harsh climate, has mixed farming, producing oats, rye, and much cattle and other livestock; (3) the piedmont zone of Banat and Crişana are more akin to the Hungarian plains, Banat producing large quantities of feeding grain for its pigs; (4) the Carpathian foothill zone in Moldavia and Walachia is a verdant country with mixed farming, vineyards, orchards, groves of walnut trees, and market gardens; (5) the Moldavian and Walachian plains slope gradually down to the Danube, and are steppe-like and in part even semiarid. This is the region of concentrated settlement, of extensive farming, of occasional famine and outbreaks of pellagra, of large-scale wheat production, maize (corn), sunflower, rape, soybean, tobacco, cotton, and hemp. The largest areas of oilseed and industrial fibre production were lost when Bessarabia was annexed by the U.S.S.R.; (6) the Danube floodplain produces a certain amount of rice. The lower Danube, in the shallows and lagoons below Giurgiu and in the delta itself, has an important fishing industry, specializing in carp, crayfish, sturgeon, and the black caviar from sturgeon.

Of the total area devoted to agriculture, about two-thirds is arable land and the rest, apart from a relatively small acreage of vineyards and orchards, consists of meadow and pasture.

Land Reform.—By the late 19th century an acute agrarian problem had been produced by the rapid growth of the population, the survival of a feudal system of land tenure, and the failure to develop manufacturing industries. After their emancipation in 1864, the peasants were granted from time to time allotments from crown lands, but these never satisfied the general land hunger. Distribution was equally unsatisfactory in the case of Bessarabia under the Russian Empire and Transylvania under the Austro-Hungarian Empire, but the Bukovinan peasants had been more fortunate in obtaining possession of a considerable share of the land. In 1920 an expropriation law was passed for Bessarabia, which was rapidly followed by similar laws for the old kingdom (1921) and for Transylvania and Bukovina (also 1921), whereby provision was made for the total expropriation of absentee landlords, foreigners, and mortmain estates, and for partial expropriation of large landed properties. By 1927 about 16,500 estates totaling more than 14,825,000 ac. (6,000,000 ha.) had been broken up. Of this land reserve, about 8,400,000 ac. (3,400,000 ha.) had been handed to 1,370,000 poor or landless peasants, but nearly 600,000 peasants were still without land.

Under the Communist regime, two further land reform acts were passed, one in 1945 expropriating private properties in excess of 123 ac. (50 ha.) and the properties of certain categories of individuals, such as Germans and war criminals, and one in 1949 confiscating the remaining property of 15,000 larger landowners. The 1945 act was followed by the distribution of land to the landless and the poorer small landholders; but the whole aim of the Communist reforms was to replace the old system not by peasant ownership but by collective farming. The liquidation of the kulak (*chiabur* in Rumanian), or larger peasant farmer, accompanied the development of collective farms. The large estates of the past and the small peasant holdings still in existence were gradually converted into large collective farms and state farms.

During the 1950s collectivization was pushed ahead rapidly. By the mid-1960s it accounted for about four-fifths of the total cropland, and in many regions agriculture was wholly collectivized. State farms, almost completely mechanized, accounted for less than one-eighth of the cropland, but it was claimed that they produced more than one-third of the wheat and about one-fifth of the meat and milk. In all, the socialist sector contributed more than nine-tenths of the wheat, rye, maize, and sunflower (a source of edible oil) and almost all the sugar-beet crop.

Crops.—Rumanian farming is dominated by grain crops—mostly maize and wheat, which between them cover about three-quarters of the cropland, but also barley, oats, rye, and rice. Vines are grown in most parts of the country, except above about 1,600 ft. (500 m.), and the area of vineyards is the ninth largest in the world. After World War II the yields of certain crops, especially sugar beet and sunflower, were greatly increased. In 1960 it was claimed that the collective farms yielded about 60% more wheat and maize per hectare than private farms, which, however, tended to be on poorer-quality land and to receive a less favourable supply of fertilizer. The use of fertilizer increased by about 30 times during the second half of the 1950s.

Another factor in the improvement of yields has been the greater use of machinery, made possible by the simultaneous development of manufacturing industry. In the mid-1960s there were about 250 machine and tractor stations supplying the collectives. In the socialist sector there were said to be about 57,500 conventional tractors, about 54,000 seeding machines (seed drills), and nearly as many cultivators. The state farms provide other sectors of agriculture with selected seed, young vines and fruit trees, and pedigree livestock.

Livestock.—After World War II improvements were effected in the number and quality of livestock. Model farms specializing in cattle breeding were set up, and between 1938 and the mid-1960s the total number of beef and dairy cattle had increased by one-fifth to about 4,700,000. In the same period the number of pigs increased from about 2,750,000 to 4,600,000. Increases were also registered in the numbers of sheep and poultry, and in the output of meat, milk, eggs, and wool.

2. Forestry.—Forestry has long been one of the most important branches of the economy, and more than one-quarter of the country, including most of the Carpathians, is forested. Lumber is traditionally floated down the mountain rivers to be marketed in the surrounding plains. Between the two world wars, however, exploitation was often not accompanied by replanting. After 1948 the government reafforested about 1,500,000 ac. (600,000 ha.) and reorganized the timber and woodworking industries. Small mills were merged into more economic undertakings, and badly sited ones were closed. New wood-using factories were built, and by the mid-1960s furniture-making capacity had increased by two-fifths and plywood capacity by nearly one-third. A far more efficient use of the timber was also achieved.

3. Mining.—Rumania has a very varied endowment in minerals, but reserves are large only in the case of petroleum. The oil-bearing strata are found in a crescent-shaped belt running along the edge of the Carpathian foothills in Muntenia and Moldavia. Even before oil became the leading industry this belt was one of the most populous in Rumania, and the peasants provided seasonal labour for the oil producers. The chief producing regions are Bacău and Buzău, and the Prahova and Dîmboviţa valleys. Most of the refineries are situated near Ploeşti, from which pipelines go to Constanţa and to Reni, U.S.S.R. The last-named was the former pipeline Ploeşti-Giurgiu, dismantled and rebuilt by the Russians after World War II.

It was not until 1854 that the extraction of petroleum began on a commercial scale. Production increased steadily, except during World War I, until a peak of 8,700,000 tons (3.5% of world production) was reached in 1936. Lack of technical skill and equipment, together with heavy wartime bomb damage, held up production after World War II. Between the end of World War II and the mid-1960s the production of crude oil increased more than threefold to about 12,000,000 metric tons annually. All the crude oil produced is now refined in Rumania.

Rumania also possesses the largest source of natural gas in Europe, with an average annual production in the mid-1960s of more than 12,000,000,000 cu.m. This methane gas, found near Mediaş, Copşa Mică, and Sărmăşel in the Transylvanian Basin, as well as along the Carpathian foothills, is widely used for lighting and heating purposes, and has become an important basis for the chemical industry.

Rumania has no large resources of coal and iron. The most important coalfield, producing anthracite and lignite, centres on Petroşani and Lupeni in the upper Jiu Valley of the southern Transylvanian Alps. At Lupeni there are also plants for the processing of coal. Relatively small reserves of hard coal, some of which is suitable for coking, are found toward the western end of the Transylvanian Alps in the Anina-Reşiţa area of Banat. Other fields of brown coal are found in the foothills in Muntenia (Filipeşti), Transylvania, and Moldavia (Comăneşti). As a result of reopening and reequipping several old mines and sinking many new ones, brown coal production had been increased from less than 3,000,000 tons in 1938 to about 10,000,000 tons annually in the early 1960s.

There are small deposits of iron ore, mainly limonite and siderite, in the vicinity of the metallurgical centres of Reşiţa and Hunedoara, but large deposits were discovered in Dobruja after World War II, though they do not appear to be worked. Gold is found in the Maramureş region, where pyrites, sphalerite, and galena are also obtained. There are extensive deposits of bauxite in the Munţii Apuseni (western Transylvania), and salt mines in the Carpathian foothills.

4. Power.—Before 1950 the consumption of electricity was small and large areas had no supply. A ten-year program of electrification was then introduced. New thermal power stations were built (e.g., at Doiceşti and Borzeşti) and at the same time use was made of the swift mountain streams by the construction of hydroelectric stations. By the early 1960s the installed capacity of Rumanian power stations exceeded 1,860,000 kw. and production was more than nine times that generated in 1938. The ancillary construction of transformers and cables had made great progress, and prospects were opening up for rural electrification and the introduction of district heating plants.

5. Manufacturing Industries.—The small industrial potential of Rumania was greatly diminished by World War II and its aftermath, but nationalization was followed by planned expansion. Between 1948 and 1955 more than 100 new industrial undertakings were built, and 200 more were rebuilt and expanded. Thereafter the rate of growth was even faster. Between 1948 and 1960 industrial production increased at an average annual rate of more than 16%. Overall it increased fivefold between 1938 and 1960.

In the course of this industrial growth the balance was tipped away from consumer goods, which in 1938 made up more than half of production, to capital goods, which in the mid-1960s accounted for more than three-fifths. Compared with 1938, production had increased by two or three times in the case of paper and also cotton, woolen, and silk fabrics, by four times for rolled steel goods, by six times for cement and steel, by eight times for pig iron, and tenfold for metallurgical coke. Virtually new products included: plastics and synthetic fibres; trucks, tractors, and other vehicles; electrical generators, transformers, and other equipment; fertilizers and dyes; and farm machinery.

Iron and Steel Industry.—This was the object of particular attention. The largest plant, at Hunedoara, was modernized and extended, and the number of blast furnaces increased; new steelworks, a rolling mill, and a battery of modern coke ovens were also added. Another integrated iron and steel plant was built at nearby Reşiţa, and a tube mill at Roman. The capacity of the smaller steel mills at Oţelu Roşu, Călan, and Cîmpia Turzii was increased, and a sheet mill built at Galaţi. In the early 1960s more than half the pig iron and seven-tenths of the steel was from plants erected since 1950. The new production of special and alloy steels would be greatly increased with the completion of the new Galaţi combine. During the 1960s as a whole it was expected that total steel production would be trebled to 4,000,000 metric tons annually.

Engineering.—Before World War II Rumania imported almost all its machines and equipment, but most domestic needs are now satisfied at home, and in some categories there is a surplus for export to other Communist countries. The engineering industry produces technically advanced kinds of oil-drilling and mining equipment, tractors, lathes, turbines, electrical apparatus, and river craft. Between 1938 and the mid-1960s the production of machinery and industrial equipment increased more than tenfold.

Chemicals.—Before World War II the chemical industry was very small. After 1948, however, fertilizer works were opened at Valea Călugăreasa, Roznov, and Făgăraş, and factories for sodium products at Govora and Borzeşti, and for synthetic fibres and plastics at Săvineşti. Production of chemicals increased tenfold between 1938 and the mid-1960s.

Consumer Goods.—These did not keep pace with the capital goods industries. Nevertheless, by the mid-1960s the food, clothing, and light industries had in general expanded at least twofold since World War II. Ceramic and tile works and the factories making textiles, ready-made clothing, leather work, footwear, and metal consumer goods had all been extended. Two sugar refineries had been built near Cluj and Suceava, the number of food canneries increased, and a large mechanized dairy set up in Bucharest.

B. Trade and Finance

1. Foreign Trade.—Foreign commerce is completely under state control, and is carried on by bilateral agreements with other governments. In the early 1960s about two-thirds of Rumania's exports went to other Communist countries, more than two-fifths going to the Soviet Union. Imports showed a similar pattern.

Exports consist primarily of lumber and wood products, grain and other vegetable products, cement, and petroleum, but Rumania also exports an increasing volume of factory goods, including complete thermal power plants, oil refinery equipment, small ships, tractors, and a wide range of machinery. The composition of the import trade has changed from primarily finished factory goods to raw materials and semimanufactures, including iron ore, coal, and certain types of machinery.

2. Currency and Banking.—During the 1930s the financial situation was dominated by the sharp drop in world agricultural prices, and by 1935 the foreign debt had risen to four-fifths of the total national debt. A further deterioration was caused by general rearmament in the late 1930s. After 1945, and before reparations payments to the U.S.S.R. were reduced, there was serious inflation. Two currency reforms ensued, the first in August 1947 when 20,000 old units were made exchangeable for one new leu, and the second in January 1952 when one new leu was exchanged for 37 old ones and the Rumanian currency was pegged officially to the Soviet ruble. In 1954 the exchange rates were fixed at 1.50 lei to the ruble, 6 lei to the U.S. dollar and 16.80 lei to the pound sterling, but in 1957 a highly preferential rate was introduced for tourists and business visitors.

Foreign indebtedness, estimated at more than £100,000,000 in the mid-1960s, consists mainly of obligations incurred before World War II. An agreement signed in 1960 provided for repayment in annual installments.

Most Rumanian banks were dissolved in August 1948, and shortly afterward the National Bank of Rumania (founded 1880) was transformed into the Bank of the Rumanian People's Republic. There are also a bank of investments, an agricultural bank, and a savings bank, all owned by the state.

3. National Finance.—In the 1960s the state's revenue slightly exceeded expenditure. The state's income is derived mainly from the operation of the socialized industries. In the mid-1960s, this sector provided rather more than 90% of total income, while direct taxes provided the rest. The budgetary allocation to the social services, including education, social insurance, medical care, housing, and organized vacations, has been gradually increased.

C. Transport and Communications

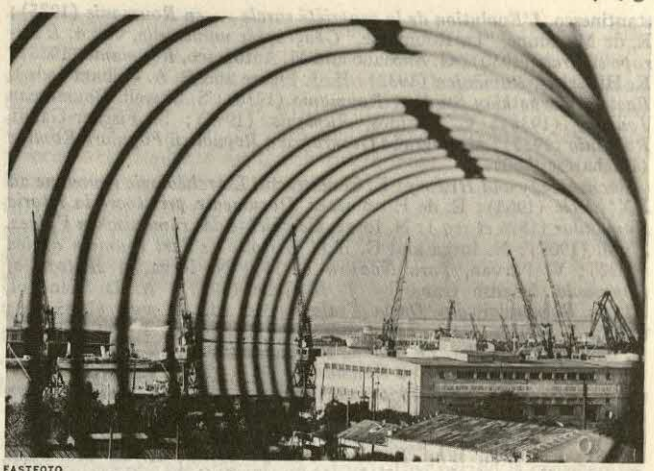
1. Before 1950.—Compared with those of Western Europe, transport and communication standards are low. Up to 1950 political and economic conditions prevented a great development of roads and railways. The former were few indeed, and the ox-cart and unmetaled roads were a more familiar sight than the motorcar and surfaced highway. Most railways were single-track, with the exception of certain sections of the Orient Express route, notably from Bucharest to Braşov, and parts of the Bucharest-Brăila line.

During World War II the Germans attempted to improve certain road and rail communications so that Rumanian resources would be more easily accessible, to relieve congestion at the bigger centres on the Danube by enlarging facilities at minor ports, and to aid the flow of military traffic across the Danube into Bulgaria. After 1945 similar operations were undertaken with the difference that trade was now directed mainly toward the other Communist countries. The new railways were extended into the Jiu coalfield and into the forests of the Moldavian Carpathians.

2. Modernization.—Under the two five-year plans (1951–60) steps were taken to develop the transport capacity of the country and to utilize transport equipment more efficiently. Larger-capacity freight cars, trucks, tankers, and buses were manufactured. By the mid-1960s the movement of freight within Rumania had increased threefold since 1938, while that of passengers had risen even more. The mileage of double-tracked railway lines was still only a very small fraction of the total, however.

In the mid-1960s the mileage of roads suitable for modern traffic was double that at the end of the war. Since 1948 the proportion of all freight carried by road had risen from 3 to about 25%. However, less than half the mileage of national roads was modernized.

3. Inland Waterways and Ports.—The Danube is navigable throughout its length in Rumania, but there are two distinct sectors for traffic: seagoing vessels of 2,000–3,000 tons go upstream as far as Brăila and Galaţi, and river vessels ply on the rest. Heavy-draft shipping does not enter the Danube but docks at Constanţa, as the Sulina bar needs constant dredging to maintain a depth of water of 22–23 ft. (6.7 to 7.0 m.). In the Iron Gate gorge, between Turnu Severin and Orşova, specially skilled pilots and



EASTFOTO

VIEW OF THE HARBOUR AT CONSTANŢA

smaller tows of barges are required to navigate the reefs and rapids, but below Calafat the current is slight. Ice blocks the river during three winters out of every four, the blockage lasting sometimes from mid-December to March. Occasionally late summer droughts close the Danube for a period in the autumn.

The Danube has a steep bank on the Bulgarian side but on the left bank below the Iron Gate gorge the floodplain is several miles wide. The railway bridge carrying the Bucharest-Constanţa line across the Danube at Cernavodă is 7½ mi. (11.8 km.) in length. A new road and railway bridge, between Giurgiu and Ruse, Bulg., was inaugurated in 1954. Another project, the Danube-Black Sea Canal, first publicized in 1949, was reported to have been begun soon after but in 1953 was abandoned.

The volume of waterborne traffic remained small for a few years after World War II but increased subsequently with the development of trade between the Communist countries. The goods carried consist mainly of Soviet iron ore destined for Czechoslovakia, together with Hungarian bauxite and Rumanian timber, oil, and cement for the U.S.S.R. The ports have tended to specialize according to their hinterland and harbour facilities. Thus Constanţa is the chief oil port, Brăila is the chief grain port, and Galaţi, besides being the main port of entry and principal naval base, handles most of the timber which is floated down the Siretul or comes by rail from Bukovina and Moldavia. The chief ports, including the seaport of Constanţa and the river ports of Galaţi and Brăila, have been extended and partially reequipped.

4. Air Transport.—A modern airport has been built at Băneasa, near Bucharest, and airports in other parts of the country have been built or improved. International airlines connect Rumania with the other Communist countries, as well as with many countries of western Europe. All internal air services are operated by TAROM (Transporturi Aeriene Romîne), the state-owned airline.

5. Postal Services and Telecommunications.—These have since their establishment been under governmental control. Postal services reach into all parts of the country, and have been greatly extended, with the creation of 2,400 new post offices, since World War II. The amount of mail handled increased about seven-fold between 1948 and the 1960s. The telephone and telegraphic services have also been greatly extended. In the mid-1960s there were about 347,500 private telephones, approximately one to every 55 persons. Telephone communication has not yet penetrated the remoter areas of the country. Telephones and telegraphic services are operated by the post office.

There are 19 radio stations, all operated by the government. In the mid-1960s there were about 2,400,000 radio receivers, or about one to every eight persons. At the same time there was only one television set to each 125 persons.

Current history and statistics are summarized annually in the *Britannica Book of the Year*.

RUMANIAN LANGUAGE, one of the Romance languages (*q.v.*), in the main is derived from the Latin of the province of Dacia, which roughly corresponds to modern Rumania. Four principal dialects may be distinguished: (1) Daco-Rumanian, or Rumanian par excellence, spoken by about 18,000,000 persons in modern Rumania, the Banat (Yugoslavia), and in some villages of Bulgaria and Hungary near the Rumanian border, that is, mostly on the left bank of the Danube; (2) Macedo-Rumanian, or Arumenian, spoken by some 350,000 persons scattered in various regions of the Balkan peninsula (Thessaly, Epirus, Albania, Macedonia, Bulgaria); (3) Megleno-Rumanian, or Meglenitic, spoken by a few thousand persons northwest of Salonika; (4) Istro-Rumanian, spoken by a few thousand persons on the Istrian peninsula around Monte Maggiore.

Although these dialects are sufficiently different from one another to make communication difficult if not impossible, they may all be classified together because of their similarity in structure.

Dacia was conquered by the Romans during the reign of Trajan in hard-fought campaigns of A.D. 101 and 105–107; it was named after the vanquished Dacians, of whom little is known. The inhabitants were virtually exterminated, and the province was colonized by settlers from all parts of the empire, especially Syria and Asia Minor, who romanized the land. It should be noted that in this romanization of Dacia the substratum population had a small part, if any. But only 170 years later, between 271 and 274, the old province of Dacia north of the Danube was abandoned under the emperor Aurelian, who established a new Dacia Ripuaria south of the Danube at the expense of Moesia and Thrace. Eventually the region became part of the Eastern empire and was the battleground and the gateway into the empire for successive Germanic tribes and nations moving southward and westward from the Baltic countries. From the early 7th century, this part of the Romance-speaking world has remained cut off from the remainder by intrusions of Slavonic peoples (the Slovenes to Pannonia, that is, Hungary and eastern Austria, the Serbs and Croats to the northwestern Balkans).

Linguists are faced with the paradox that in the older Dacia (abandoned by the Romans in 271) Latin speech was preserved, whereas in the newer Dacia Ripuaria south of the Danube (which remained much longer in Roman hands) Slavonic dialects are spoken. Unfortunately, the social and ethnic history of the area during the dark ages is too little known to provide a good explanation. As far as the Romance language of Rumania is concerned, linguists seeking a reason for its presence have proposed two principal theories: (a) Latin speech was continued throughout the ages in Rumania; indeed, the withdrawal of the Romans under Aurelian to regions south of the Danube was not complete, and later non-Romance-speaking invaders were absorbed, at least linguistically, by the tenacious colonists; (b) the retreat of the Romans under Aurelian was indeed total, but Romance-speaking people later recrossed the Danube when onrushing Slavs forced them out of their homes. Some of them moved into other regions, where they planted the various dispersed Rumanian dialects now lying outside of Rumania proper. Since the first report of Neo-Latin speech in Rumania dates only from the 13th century and since the first Rumanian text available stems from the early 16th century, the belief in remigration and noncontinuity of speech seems confirmed. But this is an *argumentum ex silentio* and therefore not conclusive.

The truth lies probably between these extremes: the Aurelian withdrawal was not complete, and a remigration did occur after the 6th century. Some linguists are eager to prove not only an uninterrupted continuity of Romance speech in Rumania but also an ethnic continuity which would make Rumanians the true descendants of the Romans, a notion dear to the heart of many patriots. Linguistic continuity, however, is not dependent on ethnic or local continuity. In the absence of other proofs, therefore, a Romance language in Rumania is no proof of the ethnic Roman-ness of modern Rumanians.

The historical development of the Rumanian language from Latin is quite regular, that is to say, the operation of the rules of phonemic development and substitution (the so-called sound laws) is not greatly disturbed by other factors. One of the most important such interferences is analogy, which restores paradigmatic orderliness that the strict obeisance to sound laws is apt to obliterate. Consequently, in view of the small part played by analogical leveling in Rumanian, it is from the descriptive point of view, and for the learner, a somewhat irregular language.

The following are the most important changes and features of Rumanian linguistic history. (For earliest developments from Latin *see* ROMANCE LANGUAGES.)

Phonology.—As in other Romance languages, Latin *ē* and *ĭ* coincide as *ę: credo* > *cred, lĭgo* > *leg*. Unlike most others, but like Sardinian, Corsican and Dalmatian, Rumanian continued the distinction between Latin *ō* and *ŭ: cōco* > *coc, fŭrcam* > *furcă*. The other Latin vowels have the same proto-Romance developments as they had in other Romance languages. Latin *-ct-* > *-pt-*, *-ks-(-x-)* > *-ps-*, *-gn-* > *-mn-: ŏcto* > *opt*, *coxam* > *coapsă*, *cognatum* > *cumnat*. A similar labialization changes *-qu-* and *-gu-* to *p* and *b: aquam* > *apă*, *linguam* > *limbă*; but before front vowels they become *ts* and *dz: quinque* > *cinci*, *sanguinem* > *sânge*. Rumanian has two high mid vowels, spelled *ă* and *â* or *î*, the first from Latin *a* in unstressed position, the second from *a* before nasal consonant: *carbonem* > *cărbune*, *aqua* > *apă*, *canto* > *cânt*. When stressed *e* or *o* is followed by a syllable containing *e* or *a* (*ă*), diphthongization occurs (through metaphony): *nigram* > *neagră* (but *nigrum* > *negru*), *mollem* > *moale*. Dental and velar consonants if followed by front vowels are palatalized: *diem* > *zi* [*dzi*]; *caelum* > *cer* [*tšer*]; *terram* > *ţeară, ţară* [*tseară, tsară*]; *gelu* > *ger* [džer]. Intervocalic *-l-* rhotacizes: *solem* > *soare*.

Morphology and Syntax.—The noun has: (a) one singular and one plural form without article (*domn, domni* [masc.]; *soare, sori* [masc.]; *casă, case* [fem.]; *carte, cărţi* [fem.]); (b) two singular and two plural forms with the article (direct case: *domnul, soarele, casa, cartea; domnii, sorii, casele, cărţile*; oblique case: *domnului, soarelui, casei, cărţii; domnilor, sorilor, caselor, cărţilor*), where the forms of the article are derived from *illu, ille, illa, illi, illae, illui* (classical dative *illi*), *illaei* (*illi*), and *illorum*, respectively. Note that the article in Rumanian is postposited. A number of nouns have different gender in the singular and plural: *câmp* (masc.); *câmpuri* (fem.). The infinitive of the verb is

shortened, *a cântà* < *cantare*, but the long form *cântare* serves as a verbal noun. The future is formed by means of *uolĕre* (classical *uelle*) "to wish" followed by the infinitive: *voiu cântà* or *cântà-voiu* "I shall (*cf.* 'will') sing"; an alternative way is a form of *a avea* (< habēre) + să + subjunctive: *am să cânt;* in the latter case the auxiliary verb may be used in an invariable form *o: o să cânt.* (Similar formations exist also in Albanian, Bulgarian, Greek and Serbian, which induced some linguists to postulate a general Balkan linguistic area.) Characteristics of syntax are: the repetition of the personal pronoun in nonsubject case forms—*pe mine nu m'a văzut* "(me) he hasn't seen me"; the replacement (not obligatory) of the infinitive direct object by a subjunctive construction (also Albanian, Greek, Bulgarian, Serbian)—*vreau să spun* "I should like to say"; the replacement of the possessive pronoun (when the possessor is not emphasized) by the dative of the personal pronoun—*mi-ai luat cartea* "you took me the book" = "you took my book" (not uncommon in other Romance languages, especially Italian and Portuguese); the use of the preposition *pe* with the direct object if this is a person—*am văzut pe vecinul nostru,* "I have seen our neighbour" (*cf.* the use of *a* in such cases in Spanish).

Vocabulary.—Among words of Latin origin in Rumanian there are a number which do not occur in other, especially the western, Romance languages. This is, of course, due to the isolation of Rumanian. (One hundred and twenty such words, or 6% of the total Romance lexicon, have been counted—but such counts must, for a variety of reasons, be taken with reservations.) It is only natural that Rumanian should contain many loanwords from non-Latin languages, especially Slavonic, but also from Turkish, Hungarian, Albanian, depending on the geographic location of a given dialect and the cultural prestige or propagating power of the donor language at a given time. On the whole, the number of Latin words in the dictionary is smaller than that of the others all together, even smaller than that of Slavonic words alone. But in a count of frequency of occurrence the percentage of Latin would be much higher.

The Rumanian literary language is based mainly on the Daco-Rumanian dialect of Walachia. It assumed importance only at the end of the 18th and the beginning of the 19th centuries. Before that all literary output was dialectal. With the literary language came also, for a time, a purist movement favoring the exclusion of all non-Romance words; this, of course, could only have crippled the language. The change-over from Cyrillic to Latin writing and the establishment of a more etymological orthography, advocated about the same time, were successful.

RUMANIAN LITERATURE. Written Rumanian literature is paralleled by a rich folklore—lyric, epic, dramatic, and didactic—which has continued till modern times. Lyrical poetry is represented by *doine* (love songs, songs expressing an undefined longing), *bocete* (dirges), *colinde* (carols), and *cântece* (lyrics); the epic by ballads in verse (*cântece bătrâneşti*) and folktales in prose; and drama by mystery plays, scenes of the Nativity, new year plays (*Vicleim, Irozi*). The didactic literature is rich in proverbs, riddles, and satiric songs.

Rumania's geographical position enabled its folklore to mediate the transfer of themes from the Balkans to the Ukraine and Russia. The religious homogeneity of the region, between Byzantium and Kiev, favoured, on the other hand, the circulation all over this area of literature written or printed in the Rumanian principalities. Western influence reached the Rumanian lands through Hungary, Transylvania, and Poland when the first political organizations were founded, east and south of the Carpathians, in the 12th–14th centuries. The Reformation inspired translation of church literature from Slavonic in the 15th century. Until the 17th century Church Slavonic was the language of the church and of the chanceries. The first state paper in Rumanian was issued in Alba Iulia, Transylvania, in 1600, by Prince Michael of Walachia. Slavonic manuscripts, of great beauty, include two "Gospel books"; one (1405) by Friar Nicodim and one, with Slavonic and Greek texts, by Gavril Urikovich, written in 1429 (now in the Bodleian Library, Oxford). In the 18th century the autochthonous ruling princes were replaced by Greek rulers from Constantinople (the Phanariotes: *see* RUMANIA: *History*) and for more than a century the culture of the principalities was mainly Greek. As, after the fall of Constantinople and the disappearance of the Slavonic states south of the Danube, the Rumanian principalities became the haven of Slavo-Byzantine culture, so in the 17th and 18th centuries they became the centre of Greek Orthodox culture. The French Revolution and the ideas of the Romantic movement shook off the domination of the Phanariotes and the national revival began under western influence.

The development of Rumanian literature may be divided into five periods: (1) from the first Rumanian texts, written in the 15th century, to the Phanariote period; this period is crowned by the translation of the Bible (1688); (2) the 18th century up to the national movement of Tudor Vladimirescu (1821); (3) the national renaissance from 1820 to World War I; (4) the period of national unity and literary integration; and (5) the period after World War II.

The Old Period.—The earliest translations from Slavonic are interlinear verses or interpolations in 15th-century religious texts. From the same period date the so-called rhotacizing texts, preserved in 16th-century copies, which were written in Maramureş, northern Transylvania, probably under the impetus of the Hussite movement. These include the Psalter of Şcheia; and the Codex of Voroneţ, which contains the Acts of the Apostles and the Psalter of Voroneţ. Linguistically, their characteristic feature is the change of intervocalic "n" to "r" in words of Latin origin (*e.g., bire* for *bine:* Latin, *bene*). The first secular text in Rumanian is a letter, of 1521, by the boyar Neacşu, to the judge of Braşov to inform him of a possible Turkish invasion.

The printing press was introduced in Walachia in the early 16th century from Venice, and the first printed book was a Slavonic liturgical book, published in Târgovişte in 1508. Later in the century a certain Deacon Coresi moved from Târgovişte to Braşov, where he printed a translation of the Gospels from Slavonic (1560–61). No copy has been found of a Lutheran catechism in Rumanian, printed in 1544. Assisted by local clergy, Coresi revised, completed, and printed translations of the Acts of the Apostles (1563). Other of his publications which survive are the *Tâlcul Evangheliilor şi Molitvenic* ("Sermons and Book of Prayers," 1564); a Psalter (1568–70); and the *Evanghelia cu învăţătură* ("Commentary on the Gospels," 1581). Coresi's publications encouraged the use of Rumanian in the churches of all three principalities. Use of Rumanian was encouraged by printing in other centres: Sas-Sebeş, where Coresi's Slavo-Rumanian Psalter was probably produced in 1577; Alba Iulia (the Gospels, 1579; *Evanghelia cu învăţătură,* 1641); Orăştie, where the Old Testament was printed in 1582 for the Rumanian Calvinists. The first Rumanian book printed in Latin characters was a Calvinist hymnbook of 1570.

In this period some secular literature was also produced. Numerous translations were made from Greek and Slavonic of historical and apocryphal books—the latter mainly under the influence of the Bogomils (*q.v.*). There is a collection of such texts in the *Codex Sturdzanus.* Many Byzantine and Oriental popular books (*e.g.,* a history of Alexander the Great, *Aesop's Fables,* and the "Arabian Nights") found their way into Rumanian literature.

Didactic literature is represented by the treatise on policy and ethics compiled from the works of Greek authors and attributed to Neagoe Basarab, prince of Walachia, 1512–21. This was written in Slavonic and translated into Rumanian in *c.* 1654. It is addressed to Basarab's son, Teodosie.

The printing of biblical and religious books was continued in the 17th century, and was given new impetus in Transylvania by the controversy resulting from the Reformation. In 1648 a translation of the Gospels in which the Greek, Latin, and Slavonic texts were collated was finished by the metropolitan Simion Ştefan, and

printed in Alba Iulia (*Noul Testament dela Bălgrad*).

The religious literature printed in the first half of the 17th century in Walachia and Moldavia was partly in reaction to the Reformation. The most important centres of printing in Walachia were Câmpulung (*Învăţături preste toate zilele*, 1642); Govora (*Pravila*, 1640; *Evangheli învăţătoare*, 1642); Mănăstirea Dealului (*Evangheli învăţătoare*, 1644); Târgovişte (*Mystirio sau Sacrament*, 1651; *Îndreptarea legii*, 1652); Râmnicu Vâlcea (*Antologhion*, 1705); Bucharest (Bucureşti; *Cheia Înţelesului*, 1678); Buzău (*Octoih*, 1700); and Snagov (*Carte sau lumină*, 1699). In Moldavia, where the monasteries were centres of theological scholarship, reaction against the Reformation found expression in the *Răspuns* ("Reply," 1645) of the metropolitan Varlaam (1580–1658) to the Calvinist catechism printed in Alba Iulia in 1642. In 1643 Varlaam had published in Jassy (Iaşi) his sermons on the Gospels (*Cartea românească de învăţătură*). In 1646 the *Pravila lui Vasile Lupu* ("Laws of Vasile Lupu," prince of Moldavia) was printed in Jassy. This was later incorporated in the Walachian *Pravila lui Matei Basarab* (1652), a collection of canonical and civil laws that remained in force, with additions, until the mid-19th century.

The Moldavian metropolitan Dosoftei (1624–93), a great scholar and theologian, fled to Poland during the fighting between Poland and Turkey that began in 1671, and in 1673 published there the first Rumanian metrical Psalter (*Psaltirea a lui David*), which was also the first poetry to be written in Rumanian. Influenced by Jan Kochanowski, he adopted Polish principles of versification. He returned to Moldavia in 1675, and in 1679 translated the liturgy from the Greek. His other outstanding contribution to Rumanian literature is his *Vieaţa şi petrecere sfintilor* ("Lives of the Saints," 4 vol., 1682–86), in which he introduced popular idioms and encouraged development of a more flexible prose style.

At this time the Orthodox see of Kiev was occupied by the Moldavian Peter Movilă (Mogila). At his request, Vasile Lupu convoked in Jassy a pan-Orthodox synod (1640) to counteract Catholic propaganda. The *Confessio Orthodoxa* which it drew up remains a doctrinal charter of the Orthodox Eastern churches (*q.v.*). A Rumanian translation, from Greek, by Radu Greceanu (*Pravoslavnica Mărturisire*) was printed in Buzău. Toward the end of the 17th century the monastery of Snagov, near Bucharest, became the centre of a pan-Orthodox literary activity, and on the initiative of the monk Antim Ivireanu, books were printed in Rumanian, Greek, Slavonic, and Arabic. A Rumanian printer, Mihai Ştefan, introduced the press into the Caucasus where he printed the first Georgian books. The humanist Udriste Năsturel translated the *Imitatio Christi* into Rumanian (Dealu, 1647) and Slavo-Russian (Moscow, 1704).

Religious literature reached its climax with the translation of the Bible (1688) from the Septuagint by a group of scholars, printed by Radu and Şerban Greceanu. This was the basis for all later translations.

Early historiography, represented by Slavonic annals and commemorative tables of the monasteries (*Letopiseţul dela Bistriţa, 1359–1506*), reached its climax with the humanist historiographers of 17th-century Moldavia. The Italian *Rinascimento*, through Polish humanism, finds expression in the words of Grigore Ureche (1590–1647), the father of Moldavian historiography: "We descend from Rome, and our language is made of Latin words." Miron Costîn (1633–91), who studied in Poland and who wrote in Polish a chronicle of Moldavia and composed a poem on the history of his country, is the leader of this historiography. He took up the history of Moldavia where it had been left by Ureche (*Letopiseţul Ţării Moldovei, 1359–1594*), and continued it to 1661. Costîn's son Niculae amplified the chronicle; Ion Neculce (1672–1745) carried it to 1743. He was a pioneer in folklore with a collection of historical legends (*Osamă de cuvinte*). Dimitrie Cantemir (*see* CANTEMIR), prince of Moldavia, wrote in Latin the history of the Rumanians (1698), which he translated into Rumanian in 1710 (*Hronicul vechimii Româno-Moldo-Vlahilor*). His Latin historical *Descriptio Moldaviae* (1716) was translated into German (1769), Russian (1786), Greek (1819), and Rumanian (1825). He took his place among western historiographers as a member of the Academy of Berlin (*Societas Regia Berolmensis*) and as a knight of the Roman Empire, with his *Historia incrementorum atque decrementorum aulae Othomanicae* (1715–16), translated into French (1743), German (1745), and English (1734–35, 1756).

A special place among Moldavian historians is occupied by Nicolae Milescu (*q.v.*), who wrote theological, historical, and travel works.

The Walachian chroniclers are less original and more personal. Stoica Ludescu compiled from earlier annals a chronicle of Walachia to 1688. He was chronicler of the Cantacuzino family. Radu Popescu (1650–1729) wrote a history of the rulers of Walachia (*Cronica Ţării Româneşti*) from the point of view of a boyar party headed by the Băleanu family. Radu Greceanu carried the history of Walachia up to 1714. The *stolnic* (steward) Constantin Cantacuzino (1650–1716), a student of the University of Padua, the political mentor and the cultural patron of his country, wrote a history of Walachia (*Istoria Ţării Româneşti* (*c.* 1710).

The 18th Century.—Some Phanariotes patronized Christian culture in the Rumanian principalities. However, this period presents a picture of social oppression and decadence. A rich secular and apocryphal literature circulated in manuscript (*Erotocritul, Fiziologul, Istoria lui Archir, Viaţa lui Esop, Halimanaua*); the monastic printing presses continued to produce beautiful books; but there was no progress in comparison with that of the past. Many liturgical books were printed. In Moldavia a new cultural centre arose at Rădăuţi. The achievements of the century are the *Minei* ("Lives of the Saints"; 1776–80), published in Rîmnicu Vîlcea; and the *Minei* (1807–15), published in the monastery of Neamţ, each in 12 volumes. The richness and lucidity of the language put these alongside the Bible of 1688.

In 1700 a minority of Rumanians of Transylvania joined the Church of Rome to obtain protection from Vienna against the Hungarians. The disciples of the theological schools of Rome and Vienna amplified the ideas of Rumania's Latin origin, taken from the Moldavian chroniclers and from the church books in Walachia. The representatives of the Latinist school of Blaj, the cultural centre of these Uniate Rumanians, were zealous scholars and patriots. Samuil Micu-Clain (1745–1806) wrote a four-volume *Istoria . . . Românilor* (Buda, 1806) and, with Gheorghe Şincai (1754–1816), author of *Hronica Românilor* (1807), published the first Rumanian grammar, *Elementa linguae daco-romanae sive valachicae* (1780). Petru Maior (1760–1821) fought for the introduction of the Latin alphabet with his *Orthographia romana sive latino-valachica* (1819), and wrote a history of the origins of the Rumanian people (*Istoria pentru începutul Românilor in Dacia*, 1812). A collective work of this school is the *Lesicon românesc-latinesc-unguresc-nemţesc* (1825).

Lyric poetry was cultivated toward the end of the century in Anacreontic love songs (publ. 1769–99), by Alecu Văcărescu. His father Ienăchiţă (1730–96?), the moralist poet, also wrote the first grammar in Rumanian: *Observaţii sau băgări de seamă asupra regulilor şi orânduielilor gramaticii româneşti* (1787); his son Iancu (1792–1863), the father of Rumanian poetry, overshadowed his predecessors by his poems (first complete edition, 1830). The fourth Văcărescu poet was Nicolae (1784–1825). The lyric tradition was carried on in Walachia by B. P. Mumuleanu (*Rost de poesii*, 1820; *Caracteruri*, 1825), who was influenced by Alphonse de Lamartine, Edward Young, and neo-Greek poetry; by Eliade Rădulescu (1802–72); Vasile Cârlova (1808–31); and by Grigore Alexandrescu (1812–85). In Moldavia this early versification is represented by Costachi Conachi (1777–1849) and Enache Kogălniceanu, who versified historical events.

Epic verse was first attempted by Ion Budai-Deleanu (1760–1820), who wrote a satirical epic *Ţiganiada* (1812), in which the heroes are gypsies. Vasile Aaron (1770–1822) wrote a vast epic on the Passion (*Patima şi moartea Domnului Isus Christos*, 1805), an imitation of Milton's *Paradise Lost;* and also *Piram şi Tisbe* (1807), inspired by the story of Pyramus and Thisbe in Ovid's *Metamorphoses*. I. Barac (1779–1848) produced the epic *Risipirea Ierusalimului* (1821) on the destruction of Jerusalem, and also translated from Homer and Ovid. Foreign plays were adapted

in Greek and Rumanian: Molière, Corneille, Kotzebue, Metastasio (*Ahilefs la Schiro,* 1797), Schiller, and also Shakespeare's *Hamlet* in a translation from German by Barac.

Anton Pann (1797–1854) popularized folk literature and edited church service books with musical notations. His *Povestea vorbii* (1847–53) is a collection of proverbs in verse, connected by popular tales.

This pre-Romantic period closed with the annexation of Bukovina (1774) by Austria and of Bessarabia (1812) by Russia, which brought about translations of law codes in Russia and Austria. Law codes were also compiled in Moldavia in 1833, and in Walachia in 1780 and 1817.

The National Renaissance.—The first landmark of this period was the rising of Tudor Vladimirescu (1821) and the return of the national rulers. Romanticism carried forward the falling wave of the Latinist movement. In the second half of the 19th century a serious literary criticism, which originated in German philosophy and French culture, inaugurated modern literature.

Transylvanian Latinism crossed the Carpathians and had beneficial effects on the Hellenized culture of Walachia. Gheorghe Lazăr (1799–1823) went from Transylvania to Bucharest as a teacher and started a school, St. Sava's College, in which he humanized the teaching. One of his pupils, Eliade Rădulescu, exercised a great influence on literary development. In 1829 he founded the political newspaper, *Curierul Românesc* (the first Rumanian newspaper in Walachia), followed by a literary supplement, *Curierul de ambe sexe* (1836). He was a pioneer of Italian influence. He founded the Societatea Filarmonică (1833), which later created the national theatre in Bucharest, and was the first president of the Rumanian Academy (Societatea Academică Română, 1866). In 1828 he published his Rumanian grammar.

The Societatea Pentru Cultură (1862) in Bukovina invited the Latinist Aron Pumnul (1818–66) from Blaj to Cernăuţi (Czernowitz), where he had among his pupils the greatest Rumanian poet of the 19th century, Mihail Eminescu. Pumnul published the *Lepturariu rumînesc* (4 vol., Vienna, 1862–64). The historian Simion Bărnuţiu (1808–64), who pronounced the speech of liberation on the Field of Freedom in Blaj (1848), took refuge in Jassy, where he taught in the university and created a school of lawyers and economists.

Gheorghe Asachi (1788–1869) represented the Italian influence in Moldavia; he created the historical short story, wrote verses in Rumanian and Italian, and founded the periodical *Albina Românească* (1829), with a literary supplement, *Alăuta Românească.*

A galaxy of poets enriched the romantic heritage. The Bessarabian Alexandru Donici (1806–66), with Costache Negruzzi, translated from Russian the satires and fables of Antiokh Kantemir; another Bessarabian, C. Stamate (1777–1868), wrote under the influence of the French and Russian Romantics and translated Thomas Moore and Sir Walter Scott. Andrei Mureşanu (1816–63), author of the revolutionary hymn *Deşteaptă-te, Române,* translated Young. The Macedo-Rumanian Dimitrie Bolintineanu (1819–72) versified historical legends. The outstanding literary personality among these poets is Grigore Alexandrescu (1812–85), who wrote *Poezii* (1832, 1838, 1839), *Meditaţii* (1863), fables and satires influenced by Boileau, Lamartine, and La Fontaine, and translated Voltaire and Byron. The learned boyar Dinicu Golescu traveled through western Europe and recorded his experiences in *Însemnare a călătoriei mele* (1826).

The national historian of this heroic period was Niculae Bălcescu (1819–52), author of *Românii sub Mihai Viteazul* (1851–52), *Puterea armată şi arta militara* (1844), and other historical and literary works. He edited the periodical *Magazinul istoric pentru Dacia* (1845–47). Modern historiography was inaugurated by Mihail Kogălniceanu (*q.v.;* 1817–91), the leading statesman in the newly organized monarchy. He produced the first edition of the old chronicles (*Letopiştele Moldoviei,* 1845–52) and edited the historical review *Arhiva românească* (1840) and the literary magazine *Dacia literară* (1840), which marks the beginning of the traditionalist trend in literature. Alecu Russo (1819–59), another leader of 1848, enriched literature with his biblical prose poem, *Cântarea României* (a hymn to Rumania).

The second half of the century was dominated by Vasile Alecsandri (*q.v.;* 1819 or 1821–90) and Mihail Eminescu (*q.v.;* 1850–89). Alecsandri's rich output comprises poetry (*Doine şi Lăcrimioare,* 1853; *Suvenire şi Mărgăritărele,* 1856); prose (*Buchetiera din Florenţa; Călătorie in Africa*); and plays (*Fântâna Blanduziei; Ovidiu; Despot Vodă*). Helped by Russo, he revealed treasures of Rumanian folklore in *Balade* (1852–53) and *Poezii populare* (1866).

Eminescu, the philosophical lyric poet, created modern Rumanian poetry. He was influenced by Hindu thought and German philosophy, but he remained rooted in tradition. He raised Rumanian poetry to new heights, and was the guiding star of every aspect of cultural life. His writings include short stories and political and philosophical essays.

Free from outside influences, Ion Creangă (1837–89), a peasant by birth, from the eastern Carpathians, wrote folktales and *Amintiri din copilărie* ("Childhood Memories," 1892), which depict peasant life with unassuming artistry.

The critic under whose aegis literary creation continued to develop until the early 20th century was the statesman and eclectic philosopher Titu Maiorescu (*q.v.;* 1840–1917). He founded in Jassy (1863) the literary circle Junimea, which reacted against form without content in art and repudiated the extremism of the Latinist school. Its periodical *Convorbiri Literare* (1867) continued to appear until 1939.

Costache Negruzzi (1808–68) excelled in prose, especially with his historical short story "Alexandru Lăpuşneanu," influenced by Scott. The archaeologist A. Odobescu (1834–95) also wrote historical stories (*Mihnea Vodă,* 1857; *Doamna Chiajna,* 1860), but his talent was revealed in *Pseudokinegetikos* (1874), an archaeological mosaic of high aesthetic emotion. I. Ghica (1816–97), the first Rumanian diplomatic representative in London, attempted the same genre in his *Convorbiri economice* (1867) and *Aminţiri* (1890). In his short stories Ion Slavici (1848–1925) described the moral conflicts of village life. I. Popovici-Bănăţeanu (1860–93) wrote about the life of the tradesmen in the Banat (*Nuvele,* 1909). Nicolae Gane (1835–1916) translated Dante's *Inferno* and wrote stories based on memories of his own early life in the countryside. Dante's *Divina Commedia* was translated by Gheorghe Coşbuc (1866–1918), the poet of rustic life (*Balade şi Idile,* 1893; *Fire de Tort,* 1896; *Cântece de vitejie,* 1904). Eminescu's follower in lyrical pessimism, Alexandru Vlahuţă (1858–1919), wrote a masterly description of the Rumanian landscape (*România pitorească,* 1903).

The greatest writer of this period was Ion Luca Caragiale (*q.v.;* 1852–1912), who created the social comedy. He also wrote a realistic drama, delightful "Moments, Sketches and Memories," and short stories. With humour and irony he presented a society in transition from orientalism to occidentalism.

Several writers stood aside from Junimea, and sometimes opposed it. Among them were the creator of the historical national drama, Barbu Stefănescu (Delavrancea) (1858–1918), with his historical trilogy *Apus de soare, Luceafărul, Viforul,* and a number of short stories; the historian-philologist B. P. Hasdeu (1836–1907); and the neoclassicist Duiliu Zamfirescu (1858–1922), whose novel-cycle, *Neamul Comăneştilor,* describes the family life of the old country gentry.

Folklore and folk literature were collected and edited by A. M. Marienescu, Urban Iarnik, and Andrei Bârseanu in Transylvania; S. F. Marian, the Czech scholar, in Bukovina; G. D. Teodorescu in Walachia; T. T. Burada in Dobruja; and G. Tocilescu. P. Ispirescu's fairy tales, *Basmele Românilor,* emulate those of Creangă. Moses Gaster (*q.v.;* 1856–1939), the pioneer in research into Rumanian folklore and folk literature, continued his activity in exile in England. I. A. Zanne published *Proverbele Românilor* (nine volumes, 1895–1901); A. Gorovei collected riddles, *Cimilitiurile Românilor* (1898).

The traditionalist movement of *Dacia literară* was continued by a galaxy of writers whose organ was *Sămănătorul* (1901–10). The poets S. O. Iosif (1875–1913) and D. Anghel (1872–1914) wrote graceful verses (*Legendă funigeilor,* 1907). P. Cerna (1881–1913) attempted with success the philosophical lyric in-

augurated by Eminescu. But the outstanding poet of this generation was the vigorous national bard of Transylvania, Octavian Goga (1881–1938).

Prose writers found inspiration in village life and in history. E. Gârleanu (1878–1914) described patriarchal life (*Bătrânii*); C. Hogaş (1847–1916) depicted the enchanted landscapes of his Moldavian mountains (*Amintiri d'intro călătorie; In munţii Neamţului*); C. Sandu-Aldea (d. 1927) described peasant life in the plain of the Bărăganul and the Danube delta.

A parallel movement to that of *Sămănătorul* was that of the periodical *Viaţa Românească* (Jassy, 1901). Its ideology, called *poporanism* on the pattern of the Russian "populism," had a social and political background. Russian influence is also seen in the work of the literary critic Constantin Dobrogeanu-Gherea (1855–1920), a follower of Hippolyte Taine and Karl Marx. The aesthete of the group was G. Ibrăileanu, author of the psychological novel *Adela*. The social critic was the Bessarabian, C. Stere.

Western modernism penetrated under various aspects. Symbolism found a great supporter in the learned philologist and gifted writer Ovid Densuşianu (1873–1938), who founded the periodical, *Viaţa Nouă* (1905). The poets Ion Minulescu (1881–1944), author of *Romanţe pentru mai târziu* (1908) and *De vorbă cu mine însumi* (1914), and Georghe Bacovia (1881–1947), who wrote *Plumb* (1916), compared favourably with western Symbolists. Impressionism found a devotee in E. Lovinescu, author of a history of contemporary literature (five volumes, 1926–37). Niculae Davidescu (1888–) in his early poems (1910) shows the influence of Baudelaire. In the epic *Cântecul omului* ("The Song of Man", 1928–37), he aimed at recreating world history. A. Macedonski (1854–1920) opposed an exotic modernism of French origin to the academic discipline of Junimea as well as to the traditionalism of *Sămănătorul;* he also wrote verses in French, as did others of his generation.

After World War I.—In the period of national unity, the novel began to compete with lyric poetry. Attempts at introducing the novel go back to 1865, when Niculae Filimon (1819–65) produced a social fresco of his period in *Ciocoii vechi şi noui* ("Old and New Upstarts," 2nd edition, 1886). Liviu Rebreanu (1885–1943?) described the peasant's thirst for soil and independence in *Ion* (1920; Eng. trans. 1965); and presented his suffering and his struggle for freedom in an epic novel, *Răscoala* (1932; *The Uprising*, 1964). In *Crăişorul Horia* (1929) he described the peasant revolt of 1784 in Transylvania. Among his psychological novels *Ciuleandra* (1927) is a fascinating clinical description, but his most powerful work, inspired by Rumanian participation in World War I, was *Pădurea spânzuraţilor* (1922; *The Forest of the Hanged*, 1930).

World War I also inspired Cezar Petrescu (1892–1961), who wrote, among other novels, *Scrisorile unui Răzeş* (1922) and *Întunecare* (1927). In *Roşu, Galben şi Albastru* (1924) the Symbolist poet Minulescu depicted life under German occupation. The lyrical novelist Ionel Teodoreanu (1897–1954) described the disappearance of patriarchal life (*La Medeleni*, 1926–27; *Turnul Mileni*, 1928). Victor Ion Popa (1897–) took his subjects from village life (*Velerim şi Veler, Doamne*, 1932; *Sfârleaza cu Fofează*); he also enriched the theatre with exquisite plays (*Muşcata din fereastră*). E. Bucuţa (1887–1941), in his *Fuga lui Şefki* (1926); and G. Mihăescu (1894–1935), in *Ruşoaică* (1933) and *Donna Albă* (1935), described the exotic life of the borderlands. Mircea Eliade set his novel *Maitreyi* (1933) in India. Matei Luca Caragiale, son of I. L. Caragiale, produced a refined piece of art in *Craii de Curtea Veche* (1929).

Gala Galaction (1879–1961) translated the Bible (1938), with Vasile Radu, and wrote mystical prose (*Bisericuţa din Răzoare*, 1914) and novels on biblical subjects (*Roxana*, 1930). Hortensia Papadat-Bengescu was a psychological analyst (*Concert din Muzică tui Bach*, 1927). Life in the suburbs of Bucharest found its interpreter in the novelist G. M. Zamfirescu (d. 1939). Humorous prose was written by D. D. Patraşcanu (1872–1937), who wittily described political life (*Candidat fără naroc*); by Damian Stănoiu, the caricaturist of monastic life; and by Gheorghe Brăescu, who satirized the harshness of army life.

The link with the older generation was assured by two prose writers: I. A. Brătescu-Voineşti (1868–1944), the sympathetic representative of the landed gentry, whose stories are mainly about the defeated inadaptables in life; and Mihail Sadoveanu (1880–1961) who became the leading realist writer of the early 20th century. His historical novels (*Şoimii*, 1904; *Zodia cancerului*, 1929; *Fraţii Jderi*, 1935) are epic reconstructions of the 15th and 16th centuries, and he also describes life in the small market towns of Moldavia, peasant life and its privations, and the beauties of nature. His work is of great importance in the development of Rumanian prose. In 1924 he was awarded the national prize for literature, and in 1949 won the Golden Peace Medal with his novel *Mitrea Cocor*, which describes the peasants' part in the war, and their emergence after it. His work is marked by compassion, realistic observation, a power to show man as an integral part of nature, and by the vivid, expressive language of his characters, an artistic stylization of the spoken language of Moldavia.

The Transylvanian writer I. Agârbiceanu (1892–) carried on Slavici's tradition, presenting in his novels and short stories the village and middle-class life of his province against a religious background (*Dela ţară*, 1906; *Arhanghelii*, 1914; *În pragul vieţii*).

Scholars and philosophers played a part in the literary life of the period as critics and writers. The classical archaeologist Vasile Pârvan (d. 1927) wrote *Parentalia*, inspired by Thucydides, to commemorate the sacrificed generation of World War I. The historian Nicolae Iorga (1871–1940) edited *Sămănătorul;* founded literary periodicals; and wrote criticism, poetry, plays, and travel descriptions. The geographer S. Mehedinţi (Soveja) edited *Convorbiri Literare* and wrote village stories (*Oameni dela munte*). The philosopher I. Rădulescu-Motru exercised great influence on intellectual life with *Personalismul energetic* (1927). Lucian Blaga (1895–1961) was a philosophic essayist (*Filosofia stilului*, 1924; *Etnografie şi artă*, 1926), as well as a poet. He began as a lyric poet (*Poemele luminii*, 1919) under the influence of western expressionism, and developed a philosophical system based on the traditional way of life interpreted as a cosmic mystery (*Trilogia cunoaşterii*, 1931–34). His poetic dramas express his philosophic thought (*Meşterul Manole*, 1927; *Cruciada copiilor*, 1930; *Avram Iancu*, 1934).

Literary criticism was represented by the aesthetician M. Dragomirescu, editor of the *Convorbiri Critice;* D. Caracostea, the analyst of Eminescu; G. Bogdan-Duică, the literary historian; Paul Zarifopol (*Pentru and literara*, 1934); A. Busuioceanu (1896–1961), the art historian, essayist, and poet of genius in Rumanian and Spanish (*Poemas patéticos*, 1948; *Innominada luz*, 1949; *Properción de vivir*, 1954).

The critic and prose writer G. Călinescu (1899–) wrote monographs on Eminescu and Creangă before World War II, and also a history (1944), which excelled in depicting the writers of the past and in subtle analysis of their work. After the war, he developed a view of literature and art as social phenomena and produced critical studies and monographs (on Niculae Filimon, 1953; Grigore Alexandrescu, 1954; etc.) He also wrote novels describing and analyzing the social life of Bucharest immediately after World War I, its gradual decay, and the part played by the intellectuals in the reconstruction after World War II.

National and private theatres offered great opportunities for playwrights. Alexandru Davila's historical verse drama *Vlaicu Vodă* (1902), Victor Eftimiu's *Cocoşul negru* (1913), M. Sorbul's *Letopiseţii* (1914) and *Patima roşie* (1916), Caton Theodorian's *Bujoreştii*, C. Ciprian's *Omul cu mârţoaga*, and Ion Sân-Giorgiu's *Masca* (1922) were among the best.

Lyric poetry was the most cultivated genre in modern Rumanian literature. Schools and periodicals were numerous. Nichifor Crainic (1889–), editor of the literary magazine *Gândirea* (1920), represented the religious traditionalist tendency (*Darurile pământului*, 1920); Ion Pillat was influenced by the French and German lyric, and sang the beauty of his native landscape (*Pe Argeş în sus*, 1923; *Satul meu*, 1926); V. Voiculescu was a profound mystic (*Intrezăriri*, 1940); Adrian Maniu produced the play *Meşterul* (1922) and wrote verses inspired by the rustic landscape. The poems of the mathematician I. Barbu evoke the geo-

metric forms of the crystal (*Joc secund*, 1930). Dragoş Protopopescu, the translator of Shakespeare, was an original poet and talented essayist on English literature.

The poet who, after Eminescu, created a new lyric poetry was Tudor Arghezi (1880–). In his poems language acquires an unusual expressiveness and harmony. His prose essays (*Cartea cu jucării*, 1935; *Ochii Maicii Domnului*, 1935; *Cimitirul Buna Vestire*, 1936) and his verse (*Cuvinte potrivite*, 1927; *Flori de mucegai*, 1931; *Versuri de seară*, 1935) were a landmark in Rumanian letters.

Developments after World War II.—Several famous writers continued to write after World War II. Arghezi reached new lyrical heights in *1907* and a hymn to man (both 1957) praising mankind's will to live and struggle for freedom. Geo Bogza (1908–), who had earlier been influenced by modernist tendencies, wrote articles, essays, and poems belonging to the "social realist" movement. Sadoveanu's later work has already been mentioned. Mihail Beniuc (1907–), whose early verse had been a clarion call to freedom for the people, became (as he said) "the drummer of the new age," and celebrated in stirring lyrics the achievements of the postwar period. Demostene Botez (1893–), whose prewar poetry had described poignantly the sadness of provincial life, later revealed a vigorous optimism and confidence. Eugen Jebeleanu (1911–), who began as a hermetic poet, wrote poems of protest on contemporary events and themes—*Lidicze; Hiroshima,* —and praised the heroism of his countrymen (*e.g.*, Bălcescu). Among those who came to the fore during and after World War II were the poets Maria Banuş (1914–), who expressed the struggle for peace in poems notable for creative and forceful use of imagery; Miron Paraschivescu, a lyrical poet who took his themes from folklore; Marcel Breslaşu, a complex writer on a wide range of themes; and a number of younger poets—Dan Deşliu, Victor Tulbure, A. E. Baconski, and Andriţoiu.

Dramatists included Aurel Baranga (1913–), who, in a series of plays, discussed the complex problems of contemporary life; Horia Lovinescu (1917–), whose plays depicted changing intellectual attitudes; M. Davidoglu, author of plays set in mines and factories; and Lucia Demetrius (1910–), also a social dramatist.

The postwar novel also dealt with topical themes. Zaharia Stancu (1902–), who had acquired a reputation as a poet before the war, wrote novels evoking with dramatic power Rumanian village life in a vanished age. Eusebiu Camilar (1900–), in his novel *Negura* ("Mist"), gave a bitter indictment of Fascism. V. E. Galan (1921–) wrote notable novels on the peasants' insurrection of 1907, and in *Bărăgan* described the effects of agricultural reform; and Marin Preda's *Moromeţi* was a vast epic work depicting peasant life on the eve of World War II.

Essays and criticism were written by Călinescu (*see* above); Mihai Ralea (1896–), who also published travel books and philosophical and psychological works; Tudor Vianu (1897–), whose early works belonged to the aesthetic school, but who in his works published in the 1950s (on style, metaphor, Stendhal, etc.) revealed a materialistic and methodological approach; and D. Panaitescu-Perpessicius, whose studies of contemporary literature, and of folklore and historiography, appeared in the critical reviews. Among critics whose names were becoming known in the 1950s were Paul Georgescu; Ovid Crohmălniceanu (whose monograph on Liviu Rebreanu appeared in 1954); Silvian Iosifescu, author of a study of the Rumanian novel (1960); and Dumitru Micu, who wrote a book on the modern novel in Rumania (1959).

(G. Ns.; X.)

RUMANIAN ORTHODOX CHURCH, an autocephalous part of the Orthodox Eastern Church, is the church to which the majority of the Rumanian people belong. Christianity first reached Dacia (which covered roughly the area of modern Rumania) under the Roman Empire at least as early as the 4th century. By the late 9th century the Rumanians appear to have accepted a Slavonic liturgy and Bulgarian ecclesiastical jurisdiction. The see of Ochrida (modern Ohrid, Yugos.) was long acknowledged and Slavonic remained the liturgical language until the 17th century, when Rumanian began to replace it. Today the Rumanian Church is almost unique among the Orthodox churches of Europe in using the modern vernacular for its liturgy. The church helped to keep alive a sense of national identity both under Turkish rule, surviving attempted hellenization, and, in Transylvania, under Hungarian rule. In the latter province it had no recognition in the post-Reformation settlement of 1571 alongside the four "received religions" (Roman Catholic, Lutheran, Calvinist, Unitarian) of the Magyar and "Saxon" peoples, and by an act of union in 1698 a large proportion of its clergy and laity accepted papal jurisdiction, becoming Eastern Rite Catholics (officially reincorporated into the Orthodox Church in 1948). The church was an important factor in the eventual emancipation of the Rumanians of Transylvania and in the integration of the greater Rumania which came into being after 1918. Outstanding was Andreiu Şaguna, first metropolitan of Transylvania, whose constitution (1868) influenced the development of the whole Rumanian Church after 1918.

Between 1917 and 1939 the Rumanian Church, as the largest of the Orthodox churches outside Russia, held a position of leadership among them. In 1935 it agreed to accept the validity of Anglican orders subject to agreement by all the rest of the Orthodox Church; this did not of course bring the two churches into communion with one another. The Rumanian patriarchate was established in 1925 and there are five metropolitan provinces: Ungro-Vlachia, Moldavia and Suceava, Ardeal (*i.e.*, Transylvania), Oltenia, and the Banat. Bukovina and Bessarabia are now incorporated into the Russian Church. In 1949 a new statute brought greater centralization and a further definition of the prerogatives of the patriarch. The church has theological institutes of university status at Bucharest and Sibiu and six seminaries for priests and chanters. A theological quarterly is published and monthly reviews by the patriarchate and each of the metropolitan sees. The Rumanian Orthodox Church became a member of the World Council of Churches in 1961.

RUMBA, a dance of uncertain Afro-Cuban origin, is done to music in 4/4 time, with insistent syncopation. The basic pattern is two quick side steps, a slow forward step, two more quick side steps, and a slow backward step. The foot is placed flat on the floor, the weight following as the step is taken. Delayed transference of the weight, accompanied by sinuous body movement, gives the rumba its characteristic style. In the original Cuban version, called the *son*, the dancers face each other without touching. The adaptation seen in the U.S. and Europe calls for the dancers to embrace except in "breaks," when the dancers separate to perform movements such as turning under the partner's arms.

RUMELIA, a general name formerly used by the Turks to denote their possessions in the Balkan Peninsula (Turkish *Rumeli*, the land of the Romans, *i.e.*, Byzantines). Before 1908 it comprised the vilayets of Istanbul (European part), Edirne, Salonika, Kosovo, Monastir, Scutari (Usküdar), and Ioánnina (Janina), in addition to the provinces of Eastern Rumelia (now the southern part of Bulgaria between the Balkans and the Rhodopes) and Bosnia and Hercegovina. Eastern Rumelia (capital Philippopolis or Plovdiv) became, by the Berlin Treaty of 1878, an autonomous province within the Turkish (Ottoman) Empire, but proclaimed its unity with Bulgaria on Sept. 18, 1885 (*see* BULGARIA). Turkish

territory in Europe is now known as Trakya (Thrace).
(N. Tu.; S. Er.; E. Tu.)

RUMFORD, COUNT VON: *see* Thompson, Sir Benjamin.

RUMI: *see* Jalal-ud-din Rumi.

RUMINANT. A very important group of mammals, the Ruminantia constitute one of the three suborders of the artiodactyls (*q.v.*), the even-toed hoofed mammals. Hooves, cud chewing and a diet of grasses or foliage are the most obvious characteristics of this suborder, which includes not only cattle, sheep and goats but also the diverse types of antelopes, giraffes, deer and chevrotains.

Although most of these animals possess either horns or antlers, all have been derived from hornless ancestors and a few, such as the musk deer of central and eastern Asia, have never developed them.

Apart from the horns which vary strikingly in shape and construction, not only from family to family but from species to species, the ruminants are a homogeneous group; perhaps the most eccentric member is the long-necked giraffe, and even this is linked with the more normal types by the okapi, an animal belonging to the giraffe family but with a shorter neck and shorter limbs than the true giraffes. In the wild state, ruminants, like all hoofed mammals, seek safety from their carnivorous enemies in flight, using their antlers or horns as weapons of defense only if driven to bay. Swiftest of all are the deer, antelopes and gazelles, while the goats and mountain sheep have a marvelous power of rapidly scaling steep heights to which few carnivores can follow them.

It is therefore among the ruminants that there is found a more perfect adaptation to a fugitive life than among any other of the larger mammals. The skeletal and muscular systems of the ruminant together form a perfectly constructed running mechanism; their digestive system is also elaborately planned so that they may hastily snatch a meal in some favourable grazing ground and store the food temporarily in a special compartment of the stomach until they have found a refuge where they can masticate and digest it at leisure.

Limbs and Feet.—In the skeleton, the proportions of the limbs and the structure of the feet are particularly noteworthy. As in all running animals the lower leg and foot are very long compared with the upper segment of each limb; this insures a long stride and at the same time a swift one. The surfaces of the joints are grooved and keeled like pulley wheels, permitting free motion forward and backward but limiting the motion in all other directions. Joints of this type are quite strong, and are admirably adapted for swift locomotion over a smooth surface, though less efficient on rough ground.

The feet are constructed on the artiodactyl plan; in each foot no more than two of the ancestral five toes are used, the rest being either lost or reduced to vestiges. The animal steps lightly on the tip of these two remaining toes, the short terminal segments of which are encased by the hoofs. The upper segments (metapodials) of each toe, fused into a single strong bone (termed the cannon bone), are in contrast very long so that the joints corresponding to the human wrist and ankle are raised high above the ground and are consequently often regarded as elbow and knee. On account of the shortness of the upper segments of the limbs, corresponding to the human upper arm and thigh, the true elbow and knee joints of the ruminant are close against its body, enclosed within the skin of the trunk.

Dentition.—Quite as distinctive as the foot of a ruminant is its skull, and especially its dentition. It will have been noticed how a sheep, when it feeds, seems not so much to bite off the grass as to tear it off by quickly jerking its head. This is because the front teeth in the upper jaw are replaced by a horny pad, while those of the lower jaw are directed forward and simply press the grass tightly against this pad on closure of the mouth; when the head is jerked sideways the grass is cut through by the sharp edges of the lower front teeth. It is also a matter of common observation that in chewing its food a ruminant swings its lower jaw to the side: it usually swings it first a number of times to one side and then, reversing the direction, about an equal number of times to the other side, so that the grinding teeth on both sides of the mouth are used in turn. These grinding or "cheek teeth" are admirably adapted for triturating hard grasses and coarse foliage. Viewed from the side, they appear to be made up of a number of columns, but looked at from the grinding surface they are seen to have a crown pattern of four crescents or Vs, sometimes complicated by little additional folds. Each crescent is enclosed by a border of enamel which, as it is a very hard substance, prevents the tooth from wearing down too quickly. Also, as the enamel does not wear down at the same rate as the softer substance within, the surface of the crown is alway rough and therefore all the more effective as a grinding mechanism. The great height of the crown also insures that the tooth will last out the animal's lifetime before it is quite ground away. Similar devices are characteristic of the molar teeth of all herbivorous mammals, a matter of considerable importance since most grasses contain a great deal of silica, which causes hard wear to the tooth.

In those ruminants that feed on soft leaves rather than on grasses, the cheek teeth are much shorter than in the exclusively graminivorous types and have a less complex crown pattern. However high the grinding teeth, the mandible of a ruminant is a slender bone, slung somewhat loosely onto the skull, and the joint between mandible and skull is shaped so as to permit great freedom of movement in grinding.

Digestive Processes.—The following account of the process of rumination is an abbreviation of that given by T. H. Huxley in his *Anatomy of Vertebrated Animals*. A ruminant does not masticate its food on first taking it into its mouth but swallows it hastily, well mixed with saliva. Only when its appetite is satisfied does it stop grazing and seek a place of safety where it can lie down and "chew the cud" at leisure. If we closely observe a cow which has just lain down in a field after a period of grazing, its body inclined to one side, we notice that after an interval of quiescence a sudden spasm, rather resembling a hiccough, passes over the animal's flanks; and that at the same time something is quickly forced up the gullet into the mouth. This is a bolus of grass which, rendered sodden by the fluids in the stomach, is now returned to be masticated by the grinding teeth. This process is repeated until most of the grass which was originally cropped has been reduced to pulp.

A ruminant's stomach is divided into four compartments. When the food is first hastily swallowed it passes no further than the first and second of these; on second swallowing, it passes along a groove in the roof of the second, directly into the third compartment; chemical digestion takes place in the fourth compartment, which alone has gastric glands in its walls for secretion of digestive jucies.

Horns.—Four main types of horn construction are found among the ruminants.

1. The antlers of deer. These are usually found in the male deer only, but in the reindeer they are present in both sexes. They grow out from the frontal bones of the skull as solid processes which rapidly reach their full size. At first they are covered by soft and hairy skin. Then a circular ridge called the burr appears at a short distance from the base of the antler and divides the latter into pedicel on the skull side of the burr, and beam on the far side.

The circulation in the beam then gradually dwindles, and the skin dies and peels off, leaving exposed the dead bone beneath it. Absorption and sloughing take place at the extremity of the pedicel, beam and burr are shed, and the end of the pedicel scabs over. Fresh skin gradually grows up under the scab so that the pedicel becomes once more smooth and hairy. The antlers are shed and grown anew every year, usually adding additional branches each time. (*See* Deer.)

2. In the bovine ruminants the bony core formed by the frontal bone is covered by a horny sheath. The core itself is hollow, instead of solid as in the deer. The horny sheath is never shed but persists throughout life and grows with the growth of the core. This type of horn is never branched but may be curved, spirally

twisted or compressed; it is often present in both sexes. (*See* SHEEP; GOAT; ANTELOPE; etc.)

3. In the giraffes (*q.v.*) the horn cores are covered with soft and hairy skin and are never shed.

4. In the North American pronghorn, *Antilocapra*, there is a permanent, unbranched horn core enclosed in a horny sheath as in the Bovidae, but this sheath is forked and furthermore is shed yearly after the rutting season since the development of a new sheath pushes the old one off. (*See* PRONGHORN.)

These four types of horn are characteristic of the five families into which existing ruminants are classified: the Cervidae or deer; the Giraffidae or giraffe and okapi; the Bovidae or oxen, sheep, goats, antelopes, etc.; the Antilocapridae, solely represented by the North American pronghorn; and the Tragulidae, the chevrotains (*q.v.*), which have no horns or antlers.

Many other forms are extinct. The earliest fossil forms were small with no antlers but a pair of long slender tusks in the upper jaw like those of the musk deer. From such as these were derived not only the modern families but several families now extinct; among them the Lagomerycidae, Amphimerycidae, etc.

See also ARTIODACTYL and articles on the separate families and genera.

See W. H. Flower and R. Lydekker, *Introduction to the Study of Mammals, Living and Extinct* (1891); W. B. Scott, *History of Land Mammals in the Western Hemisphere* (1937). (H. S. P.; X.)

RUMMY (RUM, RHUM, ROMME), the most generally known of all card games and, with its many variants including canasta (*q.v.*) and gin rummy, the most widely played, especially in the United States. The original version, introduced early in the 20th century, was called conquian (*see* COONCAN) from the Spanish *con quién* "with whom." The English gave it its lasting name by calling it rum (queer) poker.

Though there are no official rules, the following procedure of the basic game is common to most variants.

From two to six may play, using a standard deck of 52 cards with or without jokers. Cards rank: K (high), Q, J, 10, 9. . . . A (low). Cards are dealt face down one at a time, clockwise beginning with the player on dealer's left. For two players, ten cards are dealt to each; for three or four, seven; for five or six, six. The remainder of the deck, the stock, is placed face down; top card of the stock is faced to start the talon or discard pile.

The common goal of all rummy games is to build sets or melds such as three or four of a kind (as four 6s, three 8s) or sequences of three or more cards of the same suit (♠J-10-9-8, etc.). A joker may represent any needed card.

Each player, at his turn, draws the top card of the stock or of the discard pile and may then face upon the table any meld or melds of three cards or more, and may also lay off any cards from his hand that match his own or another player's exposed melds. He must then discard one card face up on the discard pile (except that on the turn when he goes out, no discard is needed).

The deal is won by the first player who goes out (melds or lays off all his cards). Melding an entire hand at one turn is called going rummy and is paid double.

The winner of each deal collects from each of the other players the index value of the cards each holds unmelded (even if matched up). Face cards count 10 each; aces 1 or 11 as previously agreed; jokers, if used, count 15.

In social play, a running score is kept and the game ends when any player reaches a predetermined score (as plus 100 points) or after an agreed number of deals.

When stock is exhausted, play ends and the hand with the lowest count wins. In some games, each player is permitted an additional turn to take or refuse the top card of the talon.

500 Rum.—This version is also called pinochle rummy; variations include Michigan rum, Oklahoma, Persian rummy and canasta. From two to eight may play. With five players or more, two full packs shuffled together are used. When two play, each is dealt 13 cards; with three or more, 7 cards are dealt to each.

At his turn, each player draws the top card of the stock or any card in the discard pile provided that: (1) he melds such card at once and (2) he puts into his hand (to meld immediately or not, as he pleases) all cards lying above the one he has drawn.

Layoffs are the same as in rummy, except that each player keeps before him the cards he has melded. When the deal ends, each player receives credit for the index value of his melds, minus the index value of all cards remaining in his hand. Aces count 15 if left in hand or if melded as a group of aces; they count but 1 if melded A-2-3.

When any player has scored 500 or more the game ends. There is no bonus for winning the game.

Persian Rummy.—Four play as partners, using one pack plus four jokers which count 20 points and may be melded only in groups of jokers. Aces count 15 and may be used only as A-K-Q or as a group of aces, not as A-2-3. If all four cards of a rank are melded at once, the value of the meld is doubled. When a player has melded all his cards, the deal ends and his side scores a bonus of 25 points. After stock is exhausted, the discard pile is drawn from until no player is able to make a meld with the exposed card of the discard pile.

Two deals constitute a game. The partnership with the higher total wins the difference between the scores, plus a game bonus of 50.

Knock Rummy.—Any player, at his turn and after drawing and discarding, may knock (lay down his entire hand) and declare the total value of his unmatched cards. He does so when he believes he has the lowest total unmatched (not part of a meld). If his assumption is correct, he collects from each opponent the difference in the counts. If another hand is lower than the knocker, the low hand wins from all and collects an extra penalty of 10 points from the knocker. (Some play that the knocker must pay double.) If a player ties for low, he collects the winnings and the knocker neither pays nor collects. If two or more other players tie for low, they divide the winnings.

Gin Rummy.—First introduced in New York in 1909, this game became a nation-wide fad in the U.S. in 1941 after scoring changes were made. Two play; each is dealt ten cards face down, one at a time, beginning with nondealer. The remainder of the pack, placed face down, forms the stock. The top card of the stock is turned up beside the stock to form the first up card.

Nondealer may take the up card or refuse it; if he refuses, dealer has the same option. If both refuse, nondealer draws the top card of the stock. Thereafter, each player in turn takes either the up card or the top card of the stock, then discards one card face up on the up card pile.

Object of play is to form melds as in rummy. Cards that do not form part of a meld are called unmatched. After drawing, a player may knock (go down) if his unmatched cards (less one discard) total 10 or less. Face cards count 10, aces 1, other cards their index value. Upon knocking, a player faces his 10 cards arranged in sets and with unmatched cards to one side, then discards his 11th card. If all his cards are matched, he is gin and he receives, in addition to the index value of his opponent's unmatched cards, a bonus of 25 points.

Opponent of the knocker may lay off any of his unmatched cards upon the knocker's sets, thereby reducing his count. If the knocker has the lower count unmatched, he wins the difference. Should his opponent remain with an equal or lesser count, he has undercut the knocker and receives the difference (if any) plus a bonus of 25 points, but the knocker cannot be undercut if he has gone gin. When only two cards remain in stock and neither player has knocked, the deal is called off with no score.

First to reach 100 points wins the game and receives a 100-point bonus. Each player then adds to his score 25 points for each hand he has won, called a box. If the loser failed to score, the game is a shutout or schneider and the winner's total score is doubled. (R. L. FY.)

RUMYANTSEV, NIKOLAI PETROVICH, COUNT (1754–1826), Russian statesman, diplomat, and bibliophile, son of P. A. Rumyantsev (*q.v.*), is best remembered as a collector of books and manuscripts, and as a patron of historical research and library acquisitions; he was born on April 14 (new style; 3, old style), 1754. Educated in part at the University of Leiden, he served in Frankfurt am Main as envoy to the elector of the Rhenish

Palatinate (1781–95), and established contact with members of the French royal family who had emigrated to Germany. Appointed envoy extraordinary and minister plenipotentiary to the German diet (1799), he exerted himself to increase Russian influence on German affairs. Under Paul I he became a senator; under Alexander I he was made director of water communications (1801–09) and minister of commerce (1802–11) in which capacities he played an important role in the improvement of water communication in Russia and the development of commerce and trade with Asia. In 1808 he became foreign minister, in 1810 president of the state council. As foreign minister, Rumyantsev worked toward close relations with France. Napoleon's invasion of Russia so upset him that he suffered an apoplectic stroke and lost his hearing. In 1814, broken in health and no longer influential, he retired from government service. After his retirement, Rumyantsev personally financed a round-the-world expedition to explore the polar regions and Polynesia, as well as other voyages.

While foreign minister, Rumyantsev published diplomatic sources of the Moscow archives at his own expense and in 1813 provided the Academy of Sciences with the financial means for examining and publishing materials from the Moscow archives of the Foreign Office. He financed the publication of all available chronicles, and promoted research and the writing of history. The St. Petersburg Rumyantsev Museum, founded in 1831, after his death, with its many books, rare manuscripts, and maps, became the heart of what is now the Lenin Library, one of the world's largest collections. Rumyantsev died at St. Petersburg on Jan. 15 (N.S.; 3, O.S.), 1826.

See Anatole G. Mazour, *Modern Russian Historiography* (1958). (G. A. Ln.)

RUMYANTSEV, PETR ALEKSANDROVICH, Count (1725–1796), Russian statesman and army officer who distinguished himself in the Seven Years' War (1756–63) and in the Russo-Turkish War of 1768–74, was born in Moscow on Jan. 15 (new style; 4, old style), 1725. As a major general he won the battles of Gross-Jägersdorf (1757) and as a lieutenant general that of Kunersdorf (1759); in 1761 he took Kolberg (Kolobrzeg) by storm.

At the accession of Catherine II in 1762 Rumyantsev, who had enjoyed the favour of Peter III, expected that his career would come to an end, but in November 1764 Catherine appointed him governor-general of the Ukraine with the secret instruction to integrate the region more closely into Russia. In the Russo-Turkish War of 1768–74 Rumyantsev gained fame by his decisive victories (1770) over immensely stronger enemy forces on the Larga and Kagul rivers. Pushing on at the enemy's heels, Rumyantsev in 1771 extended the campaign to the banks of the Danube, and in 1774 not only crossed the Danube but approached the fortress of Shumla in Bulgaria. After the peace of Kuchuk-Kainarji (1774), Rumyantsev, who in July 1775 had attained the rank of field marshal and had received the title of Count Zadunaiski, carried on with his administrative work in the Ukraine. In 1794 he was called upon by Catherine II to "pacify" the Poles, but this was achieved mainly by A. V. Suvorov (*q.v.*). He died at Tashan, Ukraine, on Dec. 19 (N.S.; 8, O.S.), 1796. (Lo. L.)

RUNCORN, a market town, river port, and urban district of Cheshire, Eng., lies on the southern shore of the Mersey, 16 mi. (26 km.) NNE of Chester by road. Pop. (1961) 26,035. It is on the Bridgewater Canal (1773), which descends there into the Mersey by a flight of locks; it is also on the Manchester Ship Canal and is a subport of Manchester with extensive wharfage and warehouse accommodation. The town possesses shipbuilding yards, iron foundries, a tannery, and large alkali and chemical works. Exports include heavy chemicals, leather, coal, salt, and pitch; there is also a large traffic in potters' materials. Runcorn is connected with Widnes by a railway bridge and, since 1961, by an arch-type, high-level road bridge which replaces the transporter bridge. On a rock, which then jutted into the Mersey, Aethelflaed erected a castle in 915. In 1964 it was designated a New Town under the New Towns Act, 1946. (T. J. L.)

RUNDI (Barundi, Warundi), an East African (Interlacustrine Bantu) people who inhabit the Kingdom of Burundi, formerly incorporated in the Belgian trust territory of Ruanda-Urundi. Numbering about 2,500,000 in the 1960s, they very closely resemble the neighbouring Ruanda (*q.v.*) in language, traditional culture, and modern economy; legend links their kingships through common ancestry.

The traditional Rundi state was more loosely organized than that of the Ruanda, among whom political and military authority was held mainly by appointees of the *mwami* (king); among the Rundi, princes of the blood ruled together as a kind of oligarchy, each having authority over a district. The overall authority of the *mwami* was frequently challenged by his fellow princes and civil war was commoner than in Ruanda.

In 1962 Burundi became an independent constitutional monarchy with a bicameral legislature elected by universal adult suffrage. The aristocratic Tutsi caste, which made up about 15% of the population, remained politically dominant, though members of the commoner Hutu group played an expanding role in public affairs. *See* Bantu (Interlacustrine); Ruanda-Urundi.

See E. M. Albert, "Socio-Political Organization and Receptivity to Change: Some Differences between Ruanda and Urundi," *Sthwest. J. Anthrop.*, vol. 16 (1960); H. Kitchen, *A Handbook of African Affairs* (1964). (L. A. Fs.)

RUNDSTEDT, (KARL RUDOLF) GERD VON (1875–1953), German army officer, leading field commander in World War II, was born at Aschersleben, near Magdeburg, on Dec. 12, 1875, of a noble Prussian family. He was chief of staff of an army corps in World War I and assisted in reorganizing the Turkish general staff. Later he was active in the secret German rearmament and on his retirement in October 1938 was the senior German field commander. Recalled to active duty before the outbreak of war in 1939, he commanded army groups in the Polish, French, and Russian campaigns and became a field marshal.

Coming into conflict with Hitler on the conduct of the Russian campaign, Rundstedt was relieved of command in 1941, but was soon restored to favour and appointed commander in chief west, with headquarters near Paris; there he prepared the defenses against the Allied invasion. He was replaced by Günther von Kluge in early July 1944, but again became commander in chief west in September and directed the Ardennes counteroffensive. He was captured by U.S. troops in May 1945 but was later released because of ill health. He died in Hanover on Feb. 24, 1953. Rundstedt regarded Hitler and his methods with contempt but never permitted conspiracy against him in his own staff.

See G. Blumentritt, *Von Rundstedt: the Soldier and the Man*, Eng. trans. (1952). (P. N. T.)

RUNE, a character of an alphabet used for the oldest form of Germanic writing. This form of writing was in use in the Scandinavian north in the 3rd century, and in remote districts of Sweden almost down to modern times. (*See* also Alphabet.)

No topic has been so much disputed as runes—by scholars, patriotic (and sometimes irrational) enthusiasts, theorists, and cranks. Chronology, transcription, and translation, a regular hodgepodge of conjecture mixed both with serious scholarship and with black magic and superstition, contribute to what often descends to mere hocus-pocus. Runes have been used to trick the credulous and the superstitious. Forgeries have turned up even in North America. The Kensington Stone, which was found in Minnesota, contains writing that is 1,000 years out of style. Viking swords, found in southern Ontario and once held to support the Kensington case, are now known to have been "planted."

Runic Forms.—During the first centuries of their vogue, runes consisted of 24 letters: the so-called older or common Germanic runic staves (fig. 1). Their peculiar forms appear first in inscriptions found all over Europe from Rumania and the western

FIG. 1.—ALL-GERMANIC RUNIC STAVES

Soviet Union to the east of France and Friesland, but in greatest number in England and Scandinavia. Runes, which were derived

from a subalpine script, differ from it radically in their arrangement, as may be seen from some inscriptions that use the runic staves in their entirety, the most important being the Kylver Stone on the island of Gotland, in the Baltic Sea (5th century); the Vadstena *braktea* from Östergötland, Swed. (fig. 2); the Charnay clasp from eastern France; and the Thames sword from southern England. Moreover, every rune had its special name and these names are known through the oral traditions recorded in Anglo-Saxon manuscripts. The 24 runes were divided into three groups of eight each, each group coming later to be called in Scandinavian an *ætt*, a word which probably meant "number of eight." The runic staves, at least at a later period, were called *futhark*, after their initial letters.

FIG. 2.—VADSTENA BRAKTEA

As regards sound values, it may be mentioned that *th* was pronounced approximately as in the English *thing; d* like *th* in the English *this; g* had a sound corresponding to *g* in German *sagen; b* in the same way, therefore, corresponding to *b* in the Spanish *Habana; ng* like *ng* in *England;* and *R*, when final, almost like *s* in the English *is*.

Origin.—The oldest extant decipherable runic writings whose origin is at all certain were discovered in the bogland of southwestern Denmark, at Vi-mose in Fyn, and at Thorsbjaerg in Schleswig. Most archaeologists date the former from the middle of the 3rd century, the latter from the 4th. The inscriptions are few in number and brief. Those that can be deciphered contain one or two names of men. These earliest finds of runes in Denmark were supplemented by a whole series of others from the 4th, 5th, and 6th centuries—inscriptions on single objects, arms, ornaments, and more especially gold *brakteas* (medallions, probably amulets). Archaeological research has established the fact that southwestern Denmark was really the cradle of the knowledge of runes, whence the use of runes spread to Norway and Sweden. It has been ascertained, moreover, that from Schleswig it made its way in the 5th century along the southern coast of the North Sea to England and the Continent.

If then, Schleswig and Fyn are the original home of the runes in northern and western Europe, the next question is: did the runes originate in Denmark or were they imported from elsewhere? It has been established that a number of runes that are contemporaneous with the oldest of those found in the Danish bogland have been discovered along a line of country passing through Pomorze, Brandenburg, Volhynia, and Rumania. Moreover, these discoveries include archaic objects the primary forms of which do not hail from western Europe but are found in southeastern Europe, on the northern coast of the Black Sea and along the middle and lower Danube and in Carinthia. From this fact, and also from the close agreement of the forms of the letters in these texts with those of the subalpine alphabets of northern Italy, and the agreement in date (*c.* 250 B.C.), the conclusion was drawn simultaneously by a number of scholars that the runes came to Scandinavia from central Europe and that the script itself was of subalpine origin. It is certain that runes were known and used among the Goths in the first half of the 4th century. In the 3rd and 4th centuries there is no trace of the existence of runes in the western Germanic world, *i.e.*, southwest of the line Schleswig, Berlin, Bucharest.

Ludwig Wimmer made it clear that they are derived ultimately from a Mediterranean form of alphabet that had its origins in a western Greek type. The runes have the same signs for the vowels *a, e, o*, as the Greek and Latin alphabets; the runes for *f, h*, and *r* derive from the Italic alphabets. Since a number of runes (as *a, i, b, t, m*, and *n*) may be traced typographically to the Greek and Latin alphabets and as it undoubtedly would be natural to seek the source of the runes in a single alphabet, Wimmer sought to trace all the runes back to Latin. In so seeking, however, he was forced into assumptions and deductions which must be regarded as improbable and irrational.

About 1928–30, three scholars saw independently that the runes derive from a subalpine Northern Etruscan alphabet which was in use in the eastern Alps among Prae-Italic tribes, and it was from these that the Germani, perhaps the Marcomanni who lived in Bohemia, developed the runes. Certain runes are more easily and naturally explained in the light of this discovery than in that of any other interpretation that has been put forward. Archaeological and chronological facts are not difficult to reconcile with this hypothesis, which is now widely accepted.

Actually its authors had been anticipated (*e.g.*, by Hempl, Skeat, C. D. Buck, and others). The resemblance between subalpine and runic scripts is great. But it is not the mere similarity that is decisive; the important facts are that the oldest known Germanic inscription is in a subalpine alphabet, and that the oldest runic texts appear at the eastern end of the Alps and beyond, not in Germany or Scandinavia.

The close relationship between the runes and cursive handwriting—the ordinary handwriting used in everyday life—indicates that the art of writing did not come to the Goths by the way of scholarship. Some individual Goths (*e.g.*, mercenaries) from the northwestern coast of the Black Sea, in the course of visits to the Roman provinces, learned Greek and Latin and the Greek and Latin forms of writing used in state edicts and in private life. In addition, they acquired an imperfect acquaintance with the lapidary and uncial style that was the basis for the ordinary cursive handwriting, wherefore some forms of the better style occasionally appear. Such a Goth, or several such Goths working together, undertook to write out the Gothic language on the basis of the knowledge of Latin and Greek writing thus acquired, and these efforts influenced the runic stave.

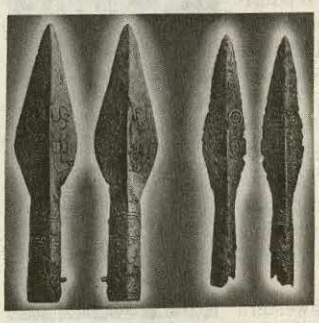

FIG. 3.—SPEARHEADS FOUND NEAR BREST, U.S.S.R.

Like the letters of the classic alphabets, runes soon came to be used for purposes of magic, a use which continued for a long time. But that the chief purpose of the runes was to give the spoken language a fixed form is demonstrated by the fact that at an early date both Ulfilas and those who used the Old English alphabets drew upon runes when the Greek or Latin scripts failed them. Removed from the sphere of classical culture, runic writing soon came to be used chiefly for inscriptions: it was carved or cut on wood, metal, or stone. In the process the individual letters began to undergo a certain kind of symmetrical stylization that gave them a substantially different appearance from that of their prototypes, and at the same time the runes came to be put in an order entirely different from that of the classic alphabets.

Spread and Development.—From the Danubian region, knowledge of runes spread with the migrating Goths to distant corners of the great dominion that this Germanic people established in the 3rd and 4th centuries between the Black Sea and the Baltic. Of the same period of migration is the Thorsbjaerg chape (metal mounting for scabbard) from Schleswig (fig. 4), which bears the inscription *owlthuthewaR niwajmariR;* these are probably the names of two men, *WulthuthewaR* and *NiujamariR*, both names being of the familiar old Germanic binomial compound type, but other interpretations have been advanced.

BY COURTESY OF LANDESMUSEUM

FIG. 4.—THORSBJAERG CHAPE

There are many signs that runic

writing was brought to Schleswig and Fyn from the Black Sea by the Heruli (*q.v.*). Schleswig in those early days and until well into the Middle Ages was of primary importance for the intercommunication and exchange of merchandise between the Baltic regions and western and southern Europe. In particular, Schleswig had long been the traffic route from the Rhineland and England up to the Scandinavian north. A remarkable runic inscription found in Schleswig is that on a golden horn from Gallehus (fig. 5), which dates from the beginning of the 5th century. It reads: *ek hlewagastiR holtijaR horna tawido*, "I Hlewegast, Holt's son, made the horn." Altogether about a dozen inscriptions on portable objects, also inscriptions of the older type as well as about 40 runic *brakteas* dating from between the 3rd and 6th centuries, have been found in Danish soil.

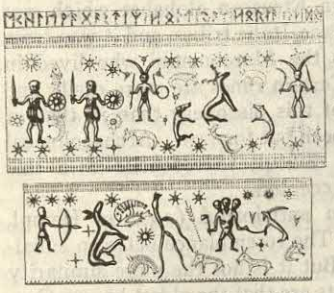

FIG. 5.—GALLEHUS INSCRIPTION

At a very early period (sometime in the 3rd century) runic writing spread from Denmark into Norway. There as early as the 4th century the custom began of equipping stone monuments with runic inscriptions. One of the finest and longest inscriptions is that of the Tune Stone from southeastern Norway (*see* fig. 6). According to Helmut Arntz, the Tune Stone may be translated: "I, Wiwaz [older Wigiwaz *Geweihter* "horned"], worked the runes to my lord [literally "loaf-warden"] Woduridaz [*i.e.*, the Wild Huntsman, the name of a priest of Wodan]. Three daughters set up the stone in honour of me Woduridaz, the [kin] nearest-to-the Ases [gods] wrought the inheritance meal."

FIG. 6.—TUNE STONE

In Norway, from the period A.D. 250–800, there are extant, in addition to a number of *brakteas* with runic inscriptions, about 50 inscriptions, mostly on standing stones or stones inserted in tumuli but also on portable objects.

The runes also moved from southwestern Denmark up the Baltic. In Gotland, ancient centre for trade and intercourse in northern Europe, staves continued to be written throughout the entire period, though not to such an extent as in Norway. Runic inscriptions have been found more sparsely on the mainland of Sweden—in Uppland, Södermanland, and Östergötland. They are commoner in Västergötland. In all, about 20 runic inscriptions from the migration period have been found in Sweden, as well as a few runic *brakteas*. Of special note among them are the late (7th century) inscriptions from the westernmost parts of Blekinge which show a continuation of the development of the runic letters that had taken place in southwestern Norway, so rich in runes, during the early and middle periods of the migration era. Probably these inscriptions also came from Norwegian immigrants. The best-preserved specimen is the Björketorp Stone (fig. 7), four metres high, with inscriptions on both sides reading: *uthArAbAsbA* ("ruin-bringing prophecy") and *hAidzruno ronu fAlAhAk hAd(e)rA ginarunAR ArAgeu hAerAmAlAusR uti AR welAdAude sAR thAt bArutR*, "This is the secret meaning of the runes; I hid here magic-runes, undisturbed by evil witchcraft. In misery shall he die by means of magic art who destroys this monument." On these Blekinge stones the runic *k* has the form ᛉ which about the year 500 was developed in Norway, while at the same time the form ᛦ appeared in Denmark, a form that proceeded thence to England.

In the 5th century the runes went to the Germanic continent and to England from southwestern Denmark. On the continent, where the runic *k* retains its original form, there have been found inscriptions from the Rhine Province, Hesse, Nassau, Thuringia, Württemberg, Bavaria, Austria, as well as in Charnay, the old Burgundian kingdom in eastern France, in what is now the *département* of Saône-et-Loire. These inscriptions are few and, like the Danish, all inscribed on portable objects, and they are quite short. They are all held to belong to the period A.D. 450–550. As an illustration may be cited the inscription on the clasp from Freilaubersheim in Rhenish Hesse: *boso wraet run-ath(i)k mafiena godd(a)*, "Boso wrote the runes—to thee, Mafiena [?], he gave [the clasp]."

FIG. 7.—BJÖRKETORP STONE

England.—Knowledge and use of runes constituted merely a brief episode on the western Germanic continent, but it flourished for five centuries in England. Anglo-Saxon rune staves like continental Germanic have two cross strokes in the letter *h* and differ from it in the form of the *k;* they differ from the Scandinavian and eastern Germanic, as well as from the continental Germanic runes with their 24 letters, in that new letters were created to render the most important novelties in the rich Anglo-Frisian vowel system. Later, new consonant letters were added.

The beginning of this development of the system of letters had already been effected on the southern portion of the coast of the North Sea in Friesland, where there are inscriptions belonging to the end of the 5th century and to the 6th century with new runic letters for *a* and *o* sounds. In England there developed a runic stave of 28 letters (fig. 8), which in the 9th century increased to 33.

FIG. 8.—EARLY ANGLO-SAXON RUNES

In England there are extant about 50 runic inscriptions upon portable objects and standing stones (stone crosses). Among the most remarkable and best preserved are those carved on a whalebone casket (Franks Casket, fig. 9). The inscriptions, with illustrations from biblical history and Roman and Germanic legends, cover the sides of the casket and the lid and are held to be from not later than about A.D. 700. The inscription on one side reads: *hronæs ban fisk flodu ahof on fergenberig warth gasrik grorn thær on greut giswom*, "Whalebone [is this]. The flood threw the fish on the hard rock. The monster [?] was stranded on the stone in agony [?]." Reproduced in fig. 10 is the later 33-letter Anglo-Saxon runic stave; it gives the runic names of oldest date.

In England the runes persisted for the entire Anglo-Saxon period. Remarkable monuments from later times are the two runic crosses from Bewcastle and Ruthwell on the Scottish border.

Because of the tradition kept alive in England from ancient times and the fact that the names borrowed by Ulfilas from the runes to render Gothic letters are indicated in a manuscript (not, indeed, in their original forms) preserved in the National Museum at Vienna, it is possible to reconstruct approximately the name that every runic letter seems to have borne from the beginning. Later traditions handed down in Scandinavia are also of value, although the later peculiarly northern runic staves contained only 16 letters and the names of 8 letters therefore have been lost. (*See* table.)

Thus the great modification of the Germanic sound system caused by vowel mutation, by breaking, and by other sound changes

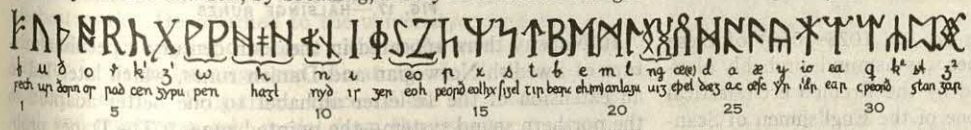

FIG. 10.—LATER ANGLO-SAXON RUNES

resulted in a considerable enlargement of the runic alphabet in England.

Scandinavia.—In Scandinavia the Germanic sound shift produced a result directly opposite to that in England: the number of the runes was reduced from 24 to 16, though the Scandinavian stock of sounds reached 30 or 40 during the later migration period. The explanation of this would seem to lie in the fact that, while the original 24 runes covered adequately the old Germanic sounds, it became the habit later, as the result of the variation in the sound system, to represent different sounds by the same rune. This brought about a simpler alphabet; when a single runic letter could be used to render several sounds, many of the old letters became superfluous. Simultaneously, the formation of many of the runes are simplified. This twofold reduction of numbers and forms began in Scandinavia as far back as the 6th century, and at the beginning of the Viking era this had resulted in a special

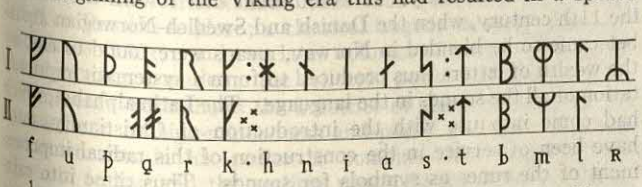

FIG. 11.—DANISH RUNES

16-letter Scandinavian alphabet. The alphabet appears in two distinct forms—Danish (fig. 11) and Swedish-Norwegian (fig. 12). Danish also was used in southwestern Sweden.

In Denmark, runes seem to have been little used after the close of the 6th century, and the form of the runic *k*, as well as other details, indicates that it was through an impulse from Norway or Sweden that runes came into use again in Denmark at the close of the 8th century. There are extant over 200 inscriptions upon standing stones as well as a few upon portable objects. Most of them date from between A.D. 800 and the middle of the 11th century. Despite their laconic and often stereotyped wording, they are among the most remarkable, as regards both style and matter, that have been found in Scandinavia. They give the names of

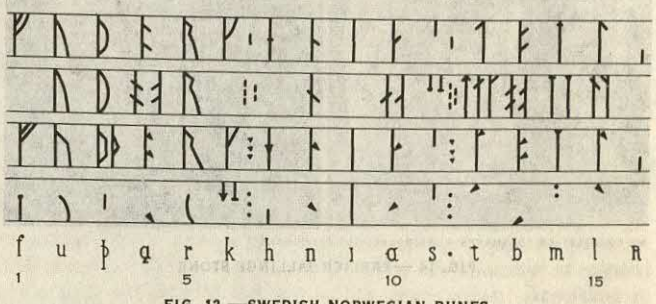

FIG. 12.—SWEDISH-NORWEGIAN RUNES

several hundred men and women who lived in Denmark during this important period, from members of the royal house down to the lower grades of society, and they provide data for visualizing the life of the people in war and peace.

The runic monuments that date from the beginning of this period are few in number. One of the oldest and most remarkable inscriptions with runes of the later period is the Helnæs stone at Fyn (fig. 13): *rhuulfR sati stain nuRa kuthi aft kuthumut bruthur sunu sin turuknathu* (*haliR uti*) *ouaiR fathi.* If it were written in a more adequate phonetic alphabet, *e.g.*, the Early Norwegian Icelandic alphabet, which includes ð, this inscription would have run: *HrólfR setti stein, NóRa goði, aft Guðmund broð urusunu sinn drunknaðu haliR uti. ÁveiR fáði,* "Rolf raised this stone, priest and chieftain of the Helnæs dwellers, in memory of his brother's son, Gudmund. The men were drowned at sea. Aveir wrote [the runes]."

From the earlier half of the 10th century the smaller of the two famous Royal stones of Jällinge in Jutland (fig. 14): *kurmR kunu*(*n*)*kR karthi ku*(*m*)*bl thusi aft thurui kunu sina tanmarkaR but,* "King Gorm made this monument in memory of his wife, Tyra: the enlarger of Denmark."

The great majority of Denmark's 200 runic stones date, however, from the end of the 10th and the beginning of the 11th centuries. It was the period when the Vikings' raids on England were renewed, resulting at last in the conquest of the country by the Danish king, Sweyn Forkbeard, who is mentioned in two of the runic inscriptions, and Canute the Great. The relations between Denmark and England are reflected in the history of the runic inscriptions inasmuch as it was probably due to influence by the Anglo-Saxon runes that the Danish alphabet then began to be enlarged by so-called pointed runes.

From Denmark the Danish runes spread about A.D. 1000 to Sweden, where runic inscriptions on standing stones became more numerous than anywhere else. Hundreds of runic inscriptions are known in Sweden, chiefly from the 11th century and the beginning of the 12th, the majority of them written in Danish runes. Half of them belong to the central region of the kingdom Uppland. These monuments make it possible to follow the upward course of the Danish runes through Sweden from Skåne and Västergötland to the southern part of Norrland; the inscriptions in the south are, on an average, of earlier date than those in

FIG. 14.—EARLIER JÄLLINGE STONE

the north. The custom of erecting runic stones was not long-lived anywhere. Generally speaking, it was abandoned whenever a region became definitely Christianized, but it seems to have had a vigorous final revival during the missionary period.

From the beginning, runic stones were erected for the most part in village graveyards, and one principal reason for giving up the custom of erecting them must have been that with the spread of Christianity the dead had to be buried in the cemetery adjoining the parish church, often at a distance from the home. Thereby, monuments lost much of their interest for the survivors. In Uppland, more especially, the runic inscriptions were accompanied by cleverly executed ornamental designs, the patterns of which were taken from woodcuts—the art of woodcuts having been highly developed during the migration and Viking periods. Not merely the runes themselves but also these ornamental designs needed craftsmanship, and therefore many runic inscriptions were executed by expert craftsmen.

The oldest and most remarkable (*c.* A.D. 1025–1050) of these Uppland professional writers of runes was Asmund, probably identical with the Osmundus mentioned by the Bremen ecclesiastical historian, Adam. Osmundus was one of the Englishmen of Scandinavian origin who prepared the way in Sweden for the conquest of Christianity. Other talented masters of the art were Fot and Öpir. Asmund's stones record the names of a number of Swedes who took part in Canute the Great's conquest of England. On the Ängeby Stone (fig. 15), one of Asmund's inscriptions reads as follows: *rahnfrithr lit risa stain thina aftiR biurn sun thaiRa kitilmuntaR. kuth hialbi hans ant aukuths muthiR. hon fil a uirlanti. in osmuntr markathi,* "Ragnfrid had this stone erected in memory of Björn, her and Kättilmund's son. God and God's Mother help his soul! He fell in Estland. But Asmund engraved [the stone]" (as rendered by Otto von Friesen).

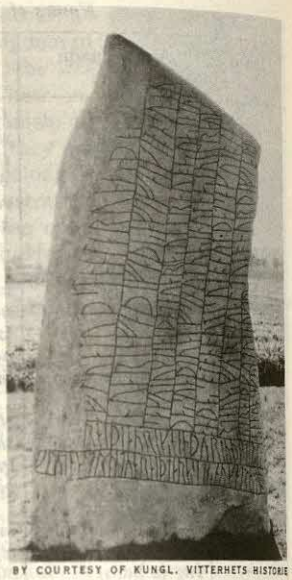
FIG. 15.—ÄNGEBY STONE

When the runic alphabet was reduced from 24 letters to 16, the simplifying of the individual letters was carried furthest in the Swedish-Norwegian runes. These are to be found in Gotland, in eastern Götaland, in Svealand, and in Norway, dating from the beginning of the Viking era, about A.D. 800. In Sweden they were displaced on monuments by Danish runes at the beginning of the 11th century, but many circumstances indicate that even after this period they were used for more private purposes. Comparatively few runic monuments have Swedish-Norwegian runes, but among these few must be mentioned the largest and most original of all, the Rök Stone (fig. 16), the top and the four sides of which are covered with runes. The stone was erected by a father in memory of his son, and the inscriptions would seem to have in some degree a magical purpose: to wreak vengeance on the son's slayers. The beginning of the inscription reads: *aft uamuth stonta runaR thaR in uarin fathi fathiR aft faikion sunu,* "In memory of Vämod stand these runes. And Varin, the father, made them in memory of his son, overtaken by death" (Friesen).



BY COURTESY OF KUNGL. VITTERHETS HISTORIE OCH ANTIKVITETS AKADEMIEN, STOCKHOLM

FIG. 16.—RÖK STONE (FRONT)

Swedish-Norwegian runes in Sweden are characterized from the start by a great reduction in the length of the cross strokes. In order to reduce as much as possible the length of the stroke, whether written or incised, the vertical strokes were done away with as far as possible. Thus came into existence the Hälsinge runes (fig. 17), named after the region of Hälsingland in which they have been found inscribed on a number of runic stones dating from the 11th century. They were known and used, however, in the central region of Sweden adjoining Mälaren, where they were likely invented. The Hälsinge runes are a kind of runic shorthand, and they clearly indicate that runes were used not merely on monuments but for all kinds of announcements: legal provisions, contracts, genealogies, and poems.

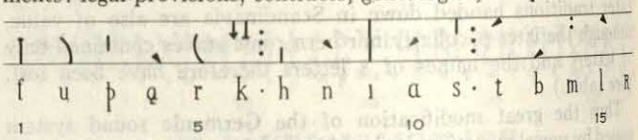


FIG. 17.—HÄLSINGE RUNES

In Norway there appeared in the 11th century a peculiar mixture of Swedish-Norwegian and Danish runes, which later led to an extension of the 16-letter alphabet to one better adapted to the northern sound system—the pointed runes. The Danes probably got the idea from England at the close of the 10th century. The Anglo-Saxon rune for *y* was a *u* inside which an *i* was written. This rune was used in Denmark before the year A.D. 1000, and after this model there was constructed out of the *i* a special letter for

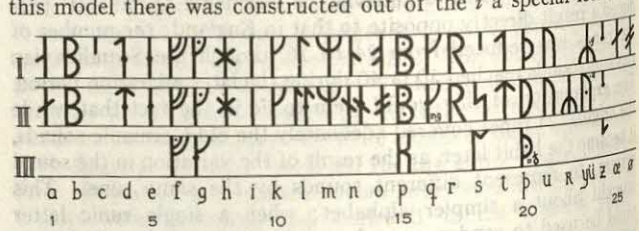

FIG. 18.—COMPLETED POINTED RUNIC ALPHABET

e and out of the *k* a special letter for *g*. These new letters are used generally in the Danish runes during the 11th century, although not consistently. It would seem that toward the close of the 11th century, when the Danish and Swedish-Norwegian alphabet came to be blended in Norway, means were found to employ the wealth of letters thus produced to form a systematic representation of all the sounds in the language. The Latin alphabet, which had come into use with the introduction of Christianity, must have been of service in the construction of this radical improvement of the runes as symbols for sounds. Thus came into existence the completed pointed runic alphabet (fig. 18).

Only in Gotland was the completed runic stave used to any great extent for inscriptions on monuments though such inscriptions are found here and there in other parts of Scandinavia. Gotland, moreover, had to begin with its own pointed runic alphabet built up on the basis of the Danish runes alone. This was

displaced later by the pointed runic alphabet in general use in Scandinavia.

Pointed runes were generally known and used in the whole of the Scandinavian north throughout the Middle Ages as the writing of cultured laymen, mainly used for private records. A Danish legal manuscript written in runes dates from the end of the 13th century. There is extant, too, a prayer book of later date, which is evidently intended for a layman not familiar with Latin. St. Bridget, who was a member of a Swedish family of nobles, in using the Latin alphabet spells Swedish in the way in which she learned as a child with runic letters.

There is evidence of the use of runes in Gotland as late as the 17th century. Runes were kept up longer than elsewhere in outlying parts of Sweden, where they were used for making occasional notes down to modern times.

(O. v. F.; J. WH.)

RUNEBERG, JOHAN LUDVIG (1804–1877), the greatest Finnish poet, whose works expressed the patriotic spirit of his countrymen and also, because they were written in Swedish, exercised great influence on Swedish literature. The son of a sea captain, he was born at Jakobstad (Pietarsaari), on the Gulf of Bothnia, on Feb. 5, 1804, when Finland was still under Swedish rule. He studied at Åbo (Turku) university, graduating in 1827, but his academic career was interrupted by the need to earn a living, and he became a private tutor on an estate in Saarijärvi. At the university he had been inspired by romantic nationalism; in the heart of the Finnish countryside he learned to know and love Finland's landscape and people and heard at firsthand some of the stories of the heroic past which were to be the themes of his best work. He returned to the university, which had moved to Helsinki, in 1830 and became clerk to the council and (1831) lecturer in Latin language and literature. In the same year he married Fredrika Tengström, niece of the archbishop of Finland, and received a gold medal from the Swedish academy for his verse romance of Finnish life, *Grafven i Perho*. In 1837 he moved to Borgå (Porvoo), where he was lecturer in classics until 1857 and rector of the college, 1847–50. He continued to live there until his death, on May 6, 1877. For the last 13 years of his life he was partly paralyzed and unable to write.

Runeberg's first book of poems appeared in 1830 and showed the direction of his gifts in their freshness, vigour and sympathy with the Finnish peasant. His two idylls, *Elgskyttarne* ("Elk Hunters," 1832) and *Hanna* (1836), won him a place in Swedish literature second only to Esaias Tegnér. In 1844 he published *Kung Fjalar* (Eng. trans., 1904), a noble cycle of unrhymed verse romances derived from old Scandinavian legends. His *Fänrik Ståls Sägner* (2 series, 1848 and 1860; Eng. trans., *The Songs of Ensign Stal*, 1925), patriotic poems describing the war of independence (1808) as experienced by an old soldier, made a tremendous impression, and the first, "Vårt land," became the Finnish national anthem. Other works include *Nadeschda* (1841), a popular epic based on Russian folklore; a classical tragedy in verse, *Kungarne på Salamis* (1863); and two later volumes of poems, which, with the 1830 volume, made up the collected poems (1830–43).

Runeberg's work shows the influence of classical literature and of Goethe in its high-mindedness and purity of form. His originality consists in his power to combine this classicism with romantic feeling and the realism which distinguishes his understanding of peasant life and character.

Runeberg's *Samlade Arbeten* were published in eight volumes, with a study by C. G. Estlander (1899–1902). Publication of his *Samlade Skrifter*, with extensive commentary, began in 1933.

(1904–06; rev., 1929); I. A. Heikel, 2 vol. (1926); L. Viljanen, 2 vol. (1944, 1948). *See* also Y. Hirn, *Runebergskulten* (1935); G. Tideström, *Runeberg som estetiker* (1941); G. Castrén, *Johan Ludvig Runeberg* (1950). For detailed criticism of the principal poems, with Eng. trans., *see* E. Gosse, *Studies in the Literature of Northern Europe* (1879). A selection of poems was trans. by E. Magnussen and E. H. Palmer, *Runeberg's Lyrical Songs, Idylls and Epigrams* (1878). (L. S. V.)

RUNNING. The most primitive form of athletic exercise considered to be a sport, running has been popular from the earliest times, and a simple footrace run straight away from starting point to goal or once over the course of the stadium (a little over 200 yd.) formed an event in the Greek Olympic pentathlon (*q.v.*). There was also a race once over the course and return and a long race run many times (often as many as 12; *i.e.*, about 2¾ mi.) up and down the stadium. There was also a short race for warriors wearing full armour and carrying sword and shield. Except in the warriors' race, the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times returned have been handed down, but the contests must have been severe since the ancient Olympic chronicles preserve the memory of several men who fell dead at the end of the long course. According to Virgil (*Aeneid*, v, 286 *et seq.*) running was practised in circus exhibitions in ancient Italy.

The best runners in the Middle Ages were most often found among the couriers maintained by potentates and municipalities. The Persian couriers of the Turkish sultans often ran from Constantinople to Adrianople and back, a distance of about 220 mi., in two days and nights. In districts of India and Africa not traversed by railways, runners were often employed to carry the mails.

Running at distances from the 50-yd. dash to the marathon (26 mi. 385 yd.) is an integral part of the sport of track and field (athletics), the most popular event of the Olympic Games. For the history of track and field events in the Olympics and for Olympic records *see* OLYMPIC GAMES.

Modern running is divided into three classes: sprinting, middle-distance, and long-distance running.

Sprinting.—Sprinting consists of running over short distances with a full and almost continuous burst of speed, the chief distances being 100, 220, and 440 yd., and the corresponding metric distances. The course for sprint races is usually marked off in lanes for the individual runners.

The old method of dropping a handkerchief was the worst way to give the starting signal since the muscles react slowly to the impression of sight, less so to those of touch, and most quickly to those of sound, a difference of $\frac{1}{25}$ sec. in reaction amounting to more than 1 ft. in a run of 100 yd. All modern footraces therefore are started by pistol. Until 1884 all classes of foot runners began their races from a standing position. In that year Bobby Macdonald, a Maori resident in Scotland, demonstrated an entirely new method known as the crouch; this method of starting became universal in a short time.

Experiments made with an electrical timing apparatus of his own invention by A. V. Hill of the University of London brought to light many interesting points in connection with the physiological processes involved in severe muscular exercise in man. Hill's experiments indicated that from 90 to 95% of the effort made by a sprinter traveling at top speed is expended in overcoming the frictional resistance of his own muscles. The force exerted by the first-class sprinter at maximum speed is equal to from 80 to 90% of his body weight; in running 100 yd. he does sufficient work to lift himself 240 to 270 ft. into the air. He will bring into play approximately 8 hp. and attain his maximum speed at 60 or 70 yd. from the start, when he may be traveling as fast as 26 mph. Approximately 1 sec. is lost in the starting process. After the 70-yd. mark is reached the runner begins to lose speed through fatigue occasioned by the rapid appearance of lactic acid in the muscles, as much as ⅛ oz. of such acid being secreted in the muscle substance every second. In the course of a 220-yd. race the speed drops more than 10% between 70 and 190 yd.

Athletes of the United States and the British Commonwealth have thoroughly dominated sprint events since the inception of the modern Olympic Games in 1896. The 100- and 220-yd. dis-

tances (and their metric equivalents, 100 and 200 m.) have been the special province of U.S. athletes, among them Bernie Wefers, Archie Hahn, Charlie Paddock, Frank Wykoff, Eddie Tolan, Jesse Owens, Mel Patton, Barney Ewell, Andy Stanfield, Bobby Morrow, Dave Sime, Frank Budd, Bob Hayes, and Henry Carr. Though his records were later broken, Owens is still regarded as one of the finest sprinters of all time. His career was climaxed in 1936 when he won the 100 and 200 m. at the Olympic Games in Berlin. At one time Owens held alone or shared the world's records for all sprint distances recognized by the International Amateur Athletic Federation. Owens' times of 9.4 sec. for 100 yd., 10.2 sec. for 100 m., 20.3 sec. for 220 yd. and 200 m. on a straight course compare favourably with the latest record list, which includes Hayes' 9.1 sec. for 100 yd., Armin Hary's (Germany) 10.0 sec. for 100 m., tied by Harry Jerome (Canada) and Hayes, and Sime's 20.0 sec. for 200 m. and 220 yd. on a straight course, later tied by Budd.

All important international races at 200 m. and 220 yd. as well as 400 m. and 440 yd. are run on an oval track, each runner being provided with his own lane, to which he must keep throughout the race. The starts are staggered so that each runner will traverse the full distance. As a result, the competitors, particularly in the 400 m. and 440 yd., have no exact knowledge of their respective positions until they have completed the final turn. Great emphasis is therefore placed on an athlete's ability to judge his speed as well as upon his speed and endurance.

First of the modern 400-m. stars was Eric Liddell of Great Britain, who lowered the world's record to 47.6 sec. at the 1924 Olympic Games. William Carr (1932 Olympic champion), Archie Williams (1936 Olympic champion) and Grover Klemmer of the U.S. took turns lowering the mark until Klemmer ran 46 sec. in 1941. Herb McKenley of Jamaica moved the 440-yd. mark to 46 sec. in 1948 and it remained there until Jim Lea of the U.S. ran 45.8 sec. in 1956. George Rhoden of Jamaica (1952 Olympic champion) did 45.8 sec. for 400 m. in 1950; this was the record until Lou Jones of the U.S. ran 45.4 sec. in 1955 and then 45.2 sec. in 1956. Glenn Davis of the U.S. lowered the 440-yd. record to 45.7 sec. in 1958. At the 1960 Rome Olympic Games Otis Davis (U.S.) and Carl Kauffmann (Germany) jointly broke the 45-sec. mark, setting a world and Olympic 400-m. record of 44.9 sec., and Adolph Plummer of the U.S. ran the same time for 440 yd. in 1963. The 1964 Olympic champion Mike Larrabee (U.S.) also ran 44.9 sec. for 400 m. at the U.S. Olympic tryouts.

Middle-Distance Running.—This comprises distances ranging from 600 yd. through 2,000 m., with the most popular races being at 880 yd. (or 800 m.) and 1 mi. (or 1,500 m.). The mile is the classic distance for all British and U.S. runners, and for years interest centred on attempts to run it in less than four minutes. This was finally achieved on May 6, 1954, by an English medical student, Roger Bannister, who did the mile in 3 min. 59.4 sec. in a dual meet at Oxford. The four-minute mark was bettered with some regularity thereafter and new records were set by John Landy of Australia (June 1954), Derek Ibbotson of Great Britain (1957), Herb Elliott of Australia (1958), Peter Snell of New Zealand (1962 and 1964), Michel Jazy of France (1965), and Jim Ryun of the U.S. (1966). Ryun's time was 3 min. 51.3 sec.

In both the 880-yd. and mile distances, strategy and tactics play a far more important role than they do in the sprints. Countless theories have been advanced as to the proper way to run each race, but runners usually fall into one of two classes: pacesetters, who try to finish all opposition with an early rush, and kick runners, who prefer to use their greater finishing speed to win in the stretch. All other things being equal, the latter runner usually prevails, as in the classic mile race between Landy and Bannister for the British Empire crown in August 1954. Landy led for over three laps but Bannister won in 3 min. 58.8 sec.

U.S. and British Commonwealth runners won all the Olympic 800-m. (880 yd.) titles from 1896 through 1964, some of the great stars being Douglas Lowe, Thomas Hampson, and Sydney Wooderson of England, and John Woodruff, Mal Whitfield, Arnold Sowell, and Thomas Courtney of the U.S., and Snell. After 1939, however, the world's record was held by Europeans, with Rudolf Harbig of Germany clocked at 1 min. 46.6 sec. in 1939 and Roger Moens of Belgium at 1 min. 45.7 sec. in 1955, until Snell ran 1 min. 44.3 sec. in 1962. In the same race, he broke Courtney's 880-yd. record, running 1 min. 45.1 sec., and in 1964 set a 1,000-m. mark with 2 min. 16.6 sec. Jim Ryun, age 19, of the U.S. lowered the 880-yd. mark to 1 min. 44.9 sec. in 1966.

The Mile.—Of all track-and-field events, the mile and 1,500 m. have been the most international, with Olympic champions and world's record holders coming from Great Britain, the United States, France, Italy, New Zealand, Finland, Sweden, Australia, Ireland, and even Luxembourg.

The most memorable names in mile history have been those of Walter George, Paavo Nurmi, Glenn Cunningham, Jack Lovelock, Gunder Hägg, Sydney Wooderson, Bannister, Landy, Elliott, Snell, Dyrol Burleson, Jim Beatty, Tom O'Hara, Jazy, and Ryun. (*See* Table I.)

George was an English professional star of the late 19th century who set a time pattern for miles that is still employed. This consists of a fast first quarter-mile, when the runner is still fresh; a slower second quarter; a still slower third quarter; and then as fast a final quarter as possible. In 1886 George ran the mile in 4 min. 12.75 sec., and no amateur broke that mark until Norman Taber of the U.S. shaded it with 4 min. 12.6 sec. in 1915.

TABLE I.—*Comparative Records of Great Mile Runners*

Quarter	George (Eng.) 1886	Hägg (Swed.) 1945	Bannister (Eng.) May 1954	Landy* (Austr.) June 1954	Ryun (U.S.) July 1966
	(sec.)	(sec.)	(sec.)	(sec.)	(sec.)
1st 440	58.5	56.6	57.5	58.5†	57.9
2nd 440	63.25	61.9	60.7	60.2†	57.6
3rd 440	66.0	61.2	62.3	58.5†	59.8
4th 440	65.0	61.6	58.9	60.6†	56.0
Mile	4:12.75	4:01.3	3:59.4	3:57.9	3:51.3

*Landy's race was on a 400-m. track, therefore intermediate times are only approximated. †Calculated time.

It was Nurmi with his theory of evenly paced quarters who brought the mark down to 4 min. 10.4 sec. in 1923, and another eight years passed before Jules Ladoumègue of France broke the 4 min. 10 sec. barrier with a time of 4 min. 9.2 sec. Around this time, Cunningham began his long career in the U.S., while Lovelock came out of New Zealand to break Ladoumègue's record with 4 min. 7.6 sec. in 1933. There ensued a series of thrilling duels between Cunningham and Lovelock, climaxed by the latter's 3 min. 47.8 sec. victory in the 1,500-m. race at the 1936 Olympic Games. Meanwhile, Cunningham had reclaimed the mile record with his 4 min. 6.8 sec. race in 1934 and he later ran 4 min. 4.4 sec. in a specially paced indoor race. Wooderson then did 4 min. 6.4 sec. in 1937, and this time held up until the advent of Hägg.

With Sweden neutral during World War II, Hägg had an opportunity denied his contemporaries from other nations. The most picturesque miler of them all, with his fluid running style, Hägg ran the mile record down to 4 min. 1.3 sec. by 1945 in stiff competition with his countryman Arne Andersson. Both were disqualified from amateur racing while still in their prime and immediately retired.

Hägg's record remained in the books until Bannister's immortal race, but once the English star smashed the 4-min. barrier, such times became almost commonplace.

Long-Distance Running.—This includes all flat races from 3,000 m. upward, as well as steeplechasing, road, and cross-country running. Among the great distance runners have been Alfred Shrubb of England, Hannes Kolehmainen and Nurmi of Finland, Hägg of Sweden and Emil Zatopek of Czechoslovakia, but by 1957, most of their records had been broken by a new crop of stars headed by Sandor Iharos and Laszlo Tábori of Hungary, Gordon Pirie of England, and Vladimir Kuts of the U.S.S.R., who in turn were succeeded in the 1960s by Pyotr Bolotnikov of the U.S.S.R., Murray Halberg and Bill Baillie of New Zealand, Michael Jazy of France, Ron Clarke of Australia, and Bob Schul, Beatty, and Billy Mills of the U.S. Before World War II, a premium was placed on simple endurance, an economical running style, and the ability to judge pace. Nurmi, who ran with effortless ease, exemplified this style and, in his prime, held all the world's records from

1,500 m. to the one for distance covered in one hour (11 mi. 1,648 yd.).

Kolehmainen and Nurmi initiated the Finnish domination of distance running which lasted from 1912 through 1946, or until Zatopek appeared on the scene. The rule of the "Flying Finns" ended dramatically in the 1948 Olympic Games when Zatopek won the 10,000-m. race in record time. The Czech army officer also placed second in the 5,000 m. with a running style that was the complete antithesis of Nurmi's—a driving, tortuous churning of legs and body, an alternation of fast sprints with steady running and an apparently complete unconcern with pace. Zatopek's success at London was mild compared to his grand slam at Helsinki four years later when he won the 5,000 m., 10,000 m. and the marathon, all in record time.

Much of the improvement in distances from 1,500 m. up to the marathon after World War II could be traced to a new type of training called *Fartlek*, or "speed-play." It consisted of long daily workouts with intervals of fast and slow running, usually on soft surfaces. Percy Cerutty of Australia, coach of Landy and Elliott, introduced such innovations as running his athletes up a soft sand hill to build endurance and leg strength. Circuit training (graduated strength and stamina regimens) and weight training began to play an increasing part from 1958. A typical week's workout for a distance runner in the 1960s involved running between 80 and 100 mi., three or four times as much as pre-World War II runners would attempt.

The years between the 1952 and 1956 Olympics saw one distance record after another fall to Iharos, Tábori, Pirie, and Kuts and, at Melbourne, it was Kuts, a Russian marine officer who fell heir to Zatopek's crown when he won the 5,000 and the 10,000 m. Then a new Olympic 10,000-m. record was set by Bolotnikov at Rome in 1960 and another by Mills at Tokyo in 1964. Zatopek's records for the 20,000 m. and for the distance covered in one hour, set in 1951, were finally broken in 1963 by Baillie of New Zealand.

Another popular event is the marathon (26 mi. 385 yd.), which, unlike the other two, is run for the most part on the open road. This distance, adopted from that used in the 1908 Olympic Games, was internationalized in 1924. Among the most outstanding modern Olympic marathon runners has been Bikila Abebe of Ethiopia, who at Tokyo in 1964 became the first man ever to win the event twice.

Steeplechasing.—Originally only a cross-country run over a course plentifully provided with natural obstacles, the modern steeplechase takes place on the cinder track of the athletic field. This event has become standardized at 3,000 m. over 7½ laps of a 400-m. track embracing a 13 ft. 1½ in.-wide water jump with a 3 ft. rail and solid hurdle barriers making 35 obstacles all told (7 water jumps and 28 hurdling jumps).

Cross-Country Running.—This had its inception with the founding of the Crick run at Rugby School in 1837, followed by many other famous schools that also held annual cross-country races. Thirty years later in 1867 the Thames Rowing Club held cross-country runs and races as a winter sport, and in a few years many other clubs were formed throughout England. Many amateur athletes use this sport, often formerly termed paperchasing, as a means of keeping fit and developing stamina for track athletics. English championships over the senior distance of 10 mi. were first held in 1877. The famous Midlands Club, Birchfield Harriers, won many of these events thereafter. The number of runners in this event increased from 33 in the first race to 700 in the second half of the 20th century.

In England races are limited for juniors (18 to under 21 years) to 6 mi. and for youths (over 16 to under 18) to 3 mi. The first international race was held in 1898 between England and France and an international championship was instituted in 1903 between England, Ireland, Scotland, and Wales. In 1907 France first competed, followed by Belgium in 1924; while Italy, Luxembourg, Spain, and Switzerland also competed in 1929. The Netherlands first came in in 1950, Yugoslavia in 1953, and Morocco and New Zealand in 1965.

The sport is also popular in the U.S. The championship distance in that country is 10,000 m.; the high school distance is 2 mi., and intercollegiate titles are decided at distances of 4 and 5 mi. Formerly included on the Olympic program, cross-country was dropped after the harrowingly hot 1924 games at Paris as not suitable for summer competition.

Relay Racing.—This form of competition has long been practised in the U.S. and has become popular throughout the world. Relay races are usually run by four men, each going a quarter of the distance. From 1911 to 1926 only one relay race was included in the English championships. This was really a medley race in which four men ran 880, 220, 220, and 440 yd., respectively. In the U.S. this race is known as a sprint medley relay and is included in most relay carnivals. England abandoned the event in 1927 and substituted two other relay races, a 440 yd. (4 × 110) and a mile (4 × 440).

The U.S. national championship relays, conducted by the Amateur Athletic Union, are at distances of 440 yd. (4 × 110), 1 mi. (4 × 440), and 2½ mi. (440, 880, and 1,320 yd., and 1 mi.). U.S. indoor championships are held at distances of 1 mi. (4 × 440) and 2 mi. (4 × 880), and the sprint medley (440, 100, 220, 300). The Olympic events are 400 m. (4 × 100) and 1,600 m. (4 × 400).

This method of racing was started in the United States about 1890, on the model of the Massachusetts firemen's "bean-pot" race.

The old method was for the men running the second quarter of the course each to take over a small flag from the first man as he arrived, before departing on their own stage of the race, at the end of which they, in their turn, handed on their flags to the awaiting next runners. The flags, however, were considered cumbersome, and for a time it was sufficient for the outgoing runner to touch or be touched by his predecessor. The baton, a hollow cylinder of wood or plastic, was introduced at the 1912 Olympics. It is carried by the runner and must be exchanged between lines drawn at right angles to the side of the track 11 yd. or 10 m. on each side of the starting line for each leg of the relay.

The growth of relay racing stems from the University of Pennsylvania, where in 1893 a relay race was included on a track program for the first time. Pennsylvania raced a team from Princeton University that year and again in 1894.

In 1895 a number of eastern U.S. colleges were invited to compete in a first annual Pennsylvania Relay Carnival. By the 1960s, more than 3,000 athletes participated annually in this two-day event, and similar carnivals were held in all parts of the nation. The usual events were the 440, 880 yd. (4 × 220), 1, 2, 4 mi. (4 × 1 mi.), sprint medley (440, 220, 220, 880), and 2½ mi.

RUNNYMEDE, the meadow celebrated as the place where King John granted the Magna Carta (*q.v.*) on June 15, 1215. It lies on the south bank of the River Thames in the urban district of Egham, Surrey, Eng., between Windsor and Staines.

The area is open to the public and is owned by the National Trust. Together with Runnymede, the slopes of Coopers Hill form the setting of a memorial commemorating Magna Carta, which was presented by the American Bar Association in 1957. The Commonwealth Air Forces Memorial, in remembrance of 20,456 airmen from the United Kingdom and the Commonwealth who "died for freedom in raid and sortie over the British Isles and the lands and seas of northern and western Europe" in World War II and who have no known graves, was opened by Queen Elizabeth II in 1953. It crowns Coopers Hill and commands a magnificent view. Both memorials were designed by Sir Edward Maufe. At the foot of the hill, next to the Mede, is a memorial to John F. Kennedy, 35th president of the United States, which was inaugurated, also by Queen Elizabeth, in 1965. (W. W. R.)

RUPERT (HRODBERT), **SAINT** (d. *c.* 710 A.D.), an early abbot and bishop after the Celtic pattern at Salzburg before the creation of the diocese by St. Boniface. Of noble Frankish parentage, Rupert was already a bishop when he went, possibly from Worms, to Bavaria toward the end of the 7th century. He founded St. Peter's church on the Wallersee and the monastery of St. Peter at Salzburg. His feast day is March 27.

RUPERT (called RUPRECHT KLEM; Lat. CLEMENS) (1352–1410), German king from 1400 to 1410, and, as Rupert III, elector palatine of the Rhine, a member of the house of Wittelsbach, was a son of the elector Rupert II and Beatrice, daughter of Peter II, king of Sicily. He was born at Amberg in the Palatinate on May 5, 1352, and succeeded as elector on his father's death in 1398. After the deposition of King Wenceslas at Oberlahnstein, Rupert was elected German king on Aug. 21, 1400, and was crowned at Cologne on Jan. 6, 1401. Later that year he went to Italy, seeking papal coronation. In alliance with the city of Florence, he attacked Gian Galeazzo Visconti, duke of Milan, but was defeated outside Brescia on Oct. 14, 1401, and returned to Germany in 1402. He was recognized as German king by Pope Boniface IX on Oct. 1, 1403. Henceforward his energies were absorbed in combating the partisans of Wenceslas in Germany; he did nothing to end the papal schism and his influence at the Council of Pisa (1409) was negligible. By his second wife, Elizabeth, sister of Frederick I, elector of Brandenburg, he left four sons and three daughters. He died at Landskron near Oppenheim on May 18, 1410, and was buried at Heidelberg.

See A. Winkelmann, *Der Romzug Ruprecht von der Pfalz* (1892); B. Gebhardt, *Handbuch der Deutschen Geschichte*, vol. i (1954).

RUPERT, PRINCE (called RUPERT OF THE RHINE OR OF THE PALATINATE) (1619–1682), royalist cavalry commander in the English Civil War, was the third son of the elector palatine and "winter king" of Bohemia, Frederick V, and of Elizabeth, daughter of James I of England. He was born in Dec. 1619 at Prague, but within a year his father was defeated at the battle of the White Mountain and the whole family was expelled from Bohemia. They eventually found a settled home in the United Provinces and there Rupert was reared. He made a precocious start to his military career in 1633 when he attended the siege of Rheinberg in the suite of Frederick Henry, prince of Orange, and two years later he was a regular member of the prince's bodyguard. High-spirited and adventurous, Rupert soon became a general favourite when he visited the English court in 1636, and a scheme was formed to appoint him governor of a projected colony in Madagascar. Nothing came of this, but although Rupert was sent back to the Netherlands in July 1637, Charles I had formed a high opinion of his character. Rupert renewed his military career but in 1638 it was cut short by his capture (Oct. 17) at Vlotho on the bank of the Weser river, and for three years he was held by the imperialists in a relatively lenient captivity.

Rupert went to England soon after his release, and, having first escorted Queen Henrietta Maria to the Netherlands, rejoined his uncle, Charles I, just before the king raised his standard in Aug. 1642. Charles had reserved the generalship of the horse for him, independent of the earl of Lindsey, the nominal commander of the whole army. He was almost immediately involved in successful skirmishes with parliamentary detachments and began to build up a reputation as a skilful and courageous commander, taking his place as one of the most dominant figures of the war (*see* CIVIL WAR, ENGLISH). His success was unbroken until the battle of Marston Moor in July 1644. The prince's contribution to royalist strategy was to instill ardour and resolution into military counsels, but his advice was not invariably followed. The plans for 1643 and 1644, both influenced by him, were drastically altered in his absence. His two brilliant and far-ranging expeditions to relieve Newark and York brought him acclaim, although the latter was followed by the defeat at Marston Moor. His influence was on the increase and in Nov. 1644 he was appointed general of the king's army. He and his party had long been opposed by factions in army and court, especially that led by Lord Digby (afterward 2nd earl of Bristol), and his appointment, although welcome to most soldiers, was distasteful to certain counselors and officers. The actions of 1645 were largely influenced by the conflict of Rupert and Digby, a cleavage made all the more apparent and disagreeable by the royalists' lack of military success. These dissensions prepared the ground for Rupert's dismissal by Charles after he had been forced to surrender Bristol to Sir Thomas Fairfax in Sept. 1645.

Rupert had brought an element of hardened professionalism to his conduct of the war and this, together with his normal hot temper, laid him open to charges of ruthlessness and even barbarity. However, Rupert was capable of generosity toward his opponents and did his best to restrain the licence of his cavalry. He even became an advocate of peace when, after the battle of Naseby (June 1645), he was convinced that the king's cause was, in a military sense, lost. This made a further point of conflict with the wildly scheming and ever optimistic Digby and a source of estrangement with the king. Royal displeasure was sudden and complete after the surrender of Bristol, and although Rupert demanded a court-martial, which gave a favourable verdict, he could be of no further use to the king.

After the capitulation of the Oxford garrison (June 1646) Rupert and his brother Maurice were hurried out of the country, but Rupert soon acquired a command of English troops in French service. He was wounded fighting against the Spanish at the siege of La Bassée in 1647. Meanwhile, he became reconciled with Charles and although the old factional jealousies survived, Rupert was given command of some royalist ships. His naval adventures were singularly unprofitable. Preying on English shipping where he could, he was chased by Robert Blake from Kinsale, Ireland (where he had been sent to assist the earl of Ormonde), to Lisbon, Cartagena and Toulon (1649–50). Driven from the Mediterranean, Rupert cruised to the Azores and to the West Indies (1651–52), losing his brother Maurice (Sept. 1652) and most of his fleet, and returning to France with one ship and a few prizes in 1653. After quarreling with Charles II, the council and his eldest brother Charles Louis, he went into retirement in Germany. The Restoration, however, tempted him to England again (Oct. 1660) and he was generously received by Charles. He was pensioned, made a privy councilor and during the Dutch wars given an active role in naval commands. He did not impress Samuel Pepys with his abilities as a naval administrator but his courage was still unquestioned. Charles rewarded him with £14,000 for his services in the second Dutch War. In times of peace Rupert sought profit in trading enterprises. He was a shareholder in the two Royal African companies (1663 and 1672) and an active member of the Hudson's Bay company (1670). He did not meddle with politics, although as a lifelong Protestant and a patriot by adoption he was disposed to sympathize with the earl of Shaftesbury's opposition to catholicizing tendencies at court. A member of the Royal society, he built himself a laboratory at Windsor castle and dabbled in scientific experiments, specializing in armaments and ballistics. But he is best known for his accomplishment as a mezzotinter.

Rupert was created duke of Cumberland and earl of Holderness in the English peerage on Jan. 24, 1644. He never married but he had a son, Dudley (d. 1686), by Frances Bard, daughter of Viscount Bellamont, and a daughter, Ruperta (d. 1740), by the actress Margaret Hughes. It is to the latter's credit that she did much to mellow Rupert's irascible nature in his last years. He died of a fever in Spring gardens, Westminster, on Nov. 29, 1682.

RUPERT'S LAND, a former district of Canada. The generous charter of Charles II, given in 1670 to the Hudson's Bay Company (*q.v.*), was interpreted to include all the country that was drained into Hudson Bay. As Prince Rupert was first governor of the Hudson's Bay Company his name was given to the

concession under the name Rupert's Land. Rupert's Land "and the North-Western Territory" were transferred to Canada by a deed of surrender dated Nov. 19, 1869, and ceased to exist as a political name. It continued to be used as the title of the Anglican episcopal diocese, in the main coincident with the province of Manitoba; and as a provincial electoral district, the far northern section of the province.

RURAL ELECTRIFICATION. In such technologically and economically advanced countries as the United States among the larger nations, and Sweden and Switzerland among the smaller, more than 90% of the farms have available a supply of electricity, while in comparatively undeveloped lands rural electrification is virtually unknown. Generally, the degree of farm electrification in any country has depended on such factors as (1) available energy sources such as coal or falling water; (2) the general development of the country and particularly the status of its electric power industry; and (3) the relative importance of agriculture in the nation's economy.

Effect on Farming Methods.—Just as the steam engine revolutionized shipping and the gasoline engine highway transportation, electric power revolutionized manufacturing and has largely revolutionized agriculture. Electric power, replacing animal and human muscle power, has greatly increased output per man-hour and the efficiency of farm operations. At the same time it has offered advantages and conveniences previously available only in urban areas.

Uses in the Household.—Originally, the aim of the farmer in connecting to an electric supply line was the same as that of the city dweller—to secure electric lighting. Electricity was later used for water pumps, washing machines, electric irons, refrigerators, radios, etc. Many farmers installed electric ranges and electric water heaters, electrically controlled central heating and modern bathrooms. Home freezers rapidly came into use on U.S. farms after World War II. The cost of operating a home freezer was relatively low and it made possible the easy storage of meats, fruits and vegetables produced on the farm for use throughout the year. As television became available throughout the country, farmers quickly installed receiving sets. The popularity of home air conditioning also spread from the cities to the farms.

Dairying.—Electric lights proved particularly useful in dairy barns and milkhouses, where much of the work is done before and after daylight hours. Milking machines and milk-cooling equipment also came into wide use to reduce labour, increase production, improve the quality and promote sanitation of the milk. With the use of milking parlours and bulk milk-handling equipment, it became possible to transfer milk directly from the cow through sanitized pipes to electrically cooled, stainless steel storage tanks and then to a dairy tanker for shipment to market. During cold weather, milk production may be increased as much as 25% through the use of thermostatically controlled drinking fountains. In many dairy barns mechanical devices have been installed in the gutters behind the cows to carry the manure outside to a manure spreader or wagon.

Poultry.—Electricity is especially useful in poultry farming. Artificial illumination timed to lengthen the day to 13 or 14 hours during autumn and winter can increase egg production in these seasons as much as 20% to 30%. An automatic water supply is highly desirable and nearly always used by successful poultry farmers. In cold weather, warming the drinking water to prevent freezing is necessary for maximum egg production. Other electrical equipment used on poultry farms includes: electrically heated brooders to keep young chicks warm and dry; electrically operated fans to remove strong ammonia fumes and excessive moisture from the poultry house; automatic feeders; and motor-driven egg cleaners and graders.

General Farming.—Farmers have used electricity for more and more operations each year. Some of its major uses are for ventilation, crop drying, conditioning and storing, feed handling, mixing and grinding, automatic feeding and soil heating. (*See* also CROP DRYING AND PROCESSING.)

The heat lamp is extensively used by farmers as a pig brooder, especially in the colder climates where spring pigs are raised. It has been estimated that at least one additional pig per litter can be raised with the proper use of the heat lamp.

Automatic handling of materials with electrically powered equipment has become increasingly important in such operations as livestock feeding, milk production and poultry farm operations. Environmental control of farm buildings in poultry production and in dairy operations has provided increased efficiency.

Rural Electrification in the United States.—Of the more than 3,700,000 farms in the United States in the 1960s, approximately 98% had electric service. The first steps toward rural electrification in the United States were taken only a few years after Thomas Edison's first generating plant began operation in New York city in 1882. Progress in rural areas lagged behind urban development of electric service, however, because of many technical and financial obstacles. For the first 15 years direct current, which could be transmitted only a few miles, was used and most generating plants were located in cities. In addition, the costs of constructing transmission and distribution lines to serve outlying farms were exceedingly high. Various methods were tried by the electric companies to lower costs. In some cases farmers paid for and owned line equipment and furnished the right of way to the power company in return for electric rates comparable to those in nearby towns. Some power companies bore the entire cost of stringing lines. In most cases, however, some form of "shared-cost" plan was adopted.

By 1920 the electric utility companies had built a vast network of transmission lines which provided 24-hour electric service to practically every city and village in the U.S. The steam turbine had been so perfected that the cost of manufacturing electricity had been greatly reduced, and the combined use of alternating current and transformers made possible the long-distance transmission of electric current at high voltages. These developments made it possible, for the first time, to supply rural electric lines radiating from the urban centres with adequate electric power at a price sufficiently low to fit into the farmer's economy. The foundation for farm electrification on a national scale had been built.

In 1921 the National Electric Light association (NELA) organized a rural service committee to determine what was necessary to step up the electrification of rural areas. It was discovered that a high degree of rural electrification would necessarily entail more than the mere construction of transmission lines into farming areas: new farm equipment would have to be developed and farmers would have to be informed of the advantages of increased electrical use.

To assist in solving these problems a joint committee was set up that included representatives of the American Farm Bureau federation, the National Grange, the American Society of Agricultural Engineers, the U.S. department of agriculture, electric companies and others. This organization, known as the Committee on the Relation of Electricity to Agriculture (CREA), was active from 1923 to 1939. It promoted research work at universities and among manufacturers and published and distributed publications dealing with applications of electricity to farm operations.

The aggressive efforts of CREA and scores of local electric companies resulted in a substantial increase in the number of farms connected to power lines each year. In 1928, for example, more than 113,000 farms were newly electrified, as compared with only 27,000 in 1924. The depression of the 1930s retarded this rapid expansion and between 1929 and 1935 relatively little progress was made in extending rural electrification in the United States.

REA.—As conditions resulting from the depression eased, the utility companies were once again able to step up their rural electrification programs. In addition, the federal government set up a new program to assist the farm electrification movement by instituting the Rural Electrification administration (REA) in 1935. Through the lending of funds to newly organized REA co-operatives, it became an increasingly important factor in the growth of rural electrification. The Tennessee Valley Authority (*q.v.*) was a major contributor to rural electrification, largely through REA, in that region.

In the second half of the 20th century, REA-financed co-operatives were serving about 51% of all farms receiving electric ser-

vice, while electric companies served about 43% and government-owned systems supplied the remaining 6%. About 40% of all REA co-operatives' power requirements were being purchased from electric companies under wholesale contracts. The average annual use of electric power on farms east of the 100th meridian was about 5,000 kw.hr. per customer. In many areas where intensive farm development programs had been carried on, annual use averaged about 30% higher than the national figure. On farms west of the 100th meridian, where use is affected by requirements of water pumping for irrigation, average annual use totaled more than 9,000 kw.hr. In comparison, the average nonfarm residential customer in the United States used a total of about 3,600 kw.hr. (*See* also AGRICULTURAL ECONOMICS: *Agricultural Credit Systems.*) (R. F. C.)

Great Britain.—The early pattern of electricity supply in Great Britain was such that privately owned companies and municipalities electrified the urban areas first and then pushed out to the more densely populated parts of the surrounding areas. After the nationalization of the industry in 1948 rural development was rapid. In England and Wales the number of electrified farms rose from 86,500 out of a total of about 281,000 in 1948 to more than 235,000 by the early 1960s and the average annual consumption per farm from about 3,500 to more than 7,600 kw.hr. In 1953 the Central Electricity authority started a ten-year plan aimed at connecting 85% of all farms. Development of the rural load was helped by the establishment of agricultural development departments by the Central Electricity authority and Area boards, by the Electrical Development association—responsible for publicity—and by the Electrical Research association, which had a rural electrification department to investigate possible applications of electricity to agriculture and horticulture. As in the United States the most important were those for crop drying, farm grinding, water heating and sterilizing in dairies, poultry rearing and for horticulture, including soil warming, artificial illumination and the control of the environment in greenhouses.

Other Countries.—While small electric plants, driven by oil engines or windmills, could supply individual premises with power for domestic use, rural electrification depended largely on the existence of main electrical networks. In many underdeveloped countries these were very limited in extent up to the middle of the 20th century. The benefits of electricity for agricultural areas were appreciated after World War II, particularly, and a number of international conferences, *e.g.,* the World Power conferences in New Delhi (1951), Rio de Janeiro (1954) and Belgrade (1957), paid particular attention to this question.

The United Nations made studies of the energy needs, including rural electrification for Latin America, southeast Asia and Europe, and its Economic Commission for Europe published a three-volume report on rural electrification in 1954 and 1958. Substantial progress was reported, for example, for Austria, France, Hungary and Sweden. In the Netherlands rural electrification was 96% complete by 1957 with an annual increase in rural consumption of 10%. In Ireland rural electrification was not undertaken until 1947 when .5% of rural inhabitants were served and annual consumption was 300,000 kw.hr.; within five years 27% of rural inhabitants were being served and annual consumption reached 127,000,000 kw.hr. Based on abundant water power, rural electrification in Norway was widespread with the highest per capita consumption in the world.

Many farms and rural communities in the U.S.S.R. were electrified, first by small local stations, later from high-voltage networks.

Extensive rural electrification in New Zealand was done under regional power boards co-operating with groups of consumers. Canadian agriculture benefited greatly through the full rural projects of the provinces. Rural projects progressed in the coastal areas of Australia and Tasmania, where water power abounds.

In Central and South America electricity consumption was generally very low except in urban areas, but some countries, *e.g.,* Trinidad, had developed rural electrification. The per capita consumption of electrical energy was also low in most of Asia, except Japan where hydro power facilitated rural electrification. Under the Colombo plan, development in southeast Asia progressed, especially in Ceylon, India and Malaya, though much remained to be done. In the first Indian five-year plan (1951–56) the electrified villages with populations under 5,000 increased from 2,792 to 5,300, and almost 20,000 had been electrified by 1961.

The International bank made loans in the 1950s for the Aberdeen-Laksapana hydroelectric project in Ceylon, a five-year rural development plan in Algeria, a hydroelectric station in Uruguay and the Kariba gorge hydroelectric project in the Federation of Rhodesia and Nyasaland, where a national electricity grid served most of the settled areas.

Uganda, helped by the Owen falls hydroelectric project, began to electrify rural districts. In South Africa progress was slow, because of great distances between the large farms, but plans in the intensively cultivated areas were successful. (E. W. G.)

RURIK (RYURIK, RÖRIK) (d. *c.* A.D. 879), a leader of the Scandinavian Vikings (or Varangians), the semilegendary founder of the Russian dynasty of Rurikids (Ryurikovichi). According to the Russian Primary Chronicle (compiled at the beginning of the 12th century), the people of Novgorod, tired of ceaseless strife, in A.D. 862 sent envoys to the Scandinavian Vikings, asking them to come to Novgorod and establish an orderly and just government. In response to this invitation, the Varangian prince, Rurik, came with his two brothers and with a large retinue (*druzhina*), and became ruler of the city and region of Novgorod.

Modern historians are not inclined to accept at face value this legendary story of the "calling of the Varangians." They surmise that Rurik came with his retinue from the Scandinavian peninsula (or from Jutland), seized the town of Ladoga, at the mouth of the Volkhov river on the southern shore of Lake Ladoga, and made it his stronghold (*c.* 855); then he proceeded southward and seized Novgorod. V. O. Klyuchevski suggested that Rurik could have been invited for the military protection of the Volkhov-Dnieper waterway, whereupon the hired mercenaries seized political power. Rurik's kinsman Oleg (*q.v.*) became founder of the grand principality of Kiev, and Oleg's successor Igor (*q.v.*), who was believed to be Rurik's son, became the real founder of the Russian princely house. (S. G. PU.)

RUSE, a town and headquarters of the *okrug* (district) of that name in northeastern Bulgaria, is situated on the right bank of the Danube opposite Giurgiu, Rumania. Pop. (1961 est.) 111,983. A Roman fortress (Prista) and river port in the 2nd century A.D., Ruse later grew as the Turkish stronghold of Ruschuk, and after 1878 (when Bulgaria was liberated) developed as a trade and industrial centre. It is one of the largest industrial towns in Bulgaria and produces agricultural machinery, textiles, plastics, rubber articles, electrical materials, oil derivatives, bitumen, hides, and sugar. River vessels are built and repaired there. Ruse is the chief river port, and has regular air service to Sofia. It is linked by rail with the Stara Zagora–Plovdiv and Sofia–Varna lines, and with Rumanian routes across the Danube bridge. The town is a cultural and educational centre, modern in appearance, with no traces of its old Oriental quarters.

RUSE OKRUG (first-order administrative division) is situated within the Danubian Platform region. Its upper tableland has a fertile loess soil and grain (wheat and maize [corn]) can be grown with the aid of irrigation. The sheltered lower valleys have a higher density of population and produce a variety of crops. (AN. BE.)

RUSH, BENJAMIN (1745–1813), U.S. physician and medical educator, designated by his contemporaries as the "American Sydenham" and even as the "Hippocrates of Pennsylvania," one of the major figures in the rise of U.S. medicine, was born of a

Quaker family on a farm near Philadelphia. Having obtained his B.A. from the College of New Jersey (later Princeton university) at the age of 15, he spent six years in Philadelphia in medical apprenticeship and completed his studies with an M.D. degree from the University of Edinburgh in 1768. After a year of travel in Europe he returned to Philadelphia, where he was appointed professor of chemistry (1769) in the College of Philadelphia (later merged with the University of Pennsylvania) and subsequently professor of the institutes of medicine and clinical practices at the University of Pennsylvania (1791). He introduced clinical instruction at the Pennsylvania hospital and initiated the Philadelphia dispensary. Rush was also deeply involved in the struggle for independence. As a member of the continental congress he was among the signers of the Declaration of Independence, and he served briefly in the army as surgeon general. Involvement in political intrigues, however, led him to return to Philadelphia, where he resumed the practice and teaching of medicine until, in 1797, he accepted Pres. John Adams' appointment as treasurer of the national mint, which office he held until his death in 1813.

Rush was a prolific writer on a vast variety of subjects which also included numerous social causes. He was a fiery proponent of the abolition of slavery, the death penalty and the use of alcohol, and he fought for prison reforms, higher education for women and free public schools for the poor. He also strongly suggested the establishment of a permanent "peace office." His medical interests were equally vast, and his therapeutic opinions tended to be dogmatic.

A strong believer in bloodletting and purging, he was inclined to enfeeble his patients upon whom he expended so much devotion and clinical attention. His *Account of the Bilious Remitting Yellow Fever As It Appeared in the City of Philadelphia in the Year 1793* is outstanding for its graphic description of the disease, but his untiring efforts and courage in taking care of yellow fever patients, until he himself became a victim of the disease, were frequently offset by his insistence upon debilitating therapeutic measures.

Yet the stubbornness which misled him in certain aspects also helped him to pursue novel and important ideas. His *Medical Inquiries and Observations Upon the Diseases of the Mind* (1812) was the first systematic American book on the subject, and his improvement of the housing of mental patients at the Pennsylvania hospital represented a decisive step toward a rational treatment of mental disease. His description of cholera infantum (1773), of dengue (1780) and of the relation between rheumatism and diseases of the teeth illustrate his unusual powers of observation.

Rush died of typhus at Philadelphia on April 19, 1813.

See *Autobiography* of Benjamin Rush, ed. with introduction and notes by George W. Corner (1948); the *Letters* [of Benjamin Rush], ed. by L. H. Butterfield (1951). (I. V.)

RUSH, RICHARD (1780–1859), U.S. statesman and diplomat, who played an important part in the founding of the Smithsonian Institution, an achievement he considered the most gratifying in his long public career, was born in Philadelphia, Pa., on Aug. 29, 1780, the son of Benjamin Rush (*q.v.*). He graduated from Princeton in 1797, was admitted to the bar in Philadelphia in 1800, was appointed attorney general of Pennsylvania in February 1811, and in November 1811 became comptroller of the U.S. treasury. In February 1814 James Madison appointed him attorney general and from March to September 1817 Rush also served as acting secretary of state. During this time he completed an agreement with Charles Bagot, the British minister in Washington, for disarmament on the Great Lakes. Later in 1817 Rush was appointed minister to Great Britain where, with the U.S. minister to France, Albert Gallatin, he negotiated the convention of 1818. This drew the boundary line between Canada and the United States from the Lake of the Woods to the Rocky Mountains at the 49th parallel and provided for joint settlement of the Oregon Territory for ten years. In 1823 he negotiated with George Canning, British foreign minister, on policy toward Latin America, negotiations which led to the enunciation of the Monroe Doctrine. He returned home in 1825 to become secretary of the treasury and in 1828 was an unsuccessful candidate for vice-president on the ticket headed by John Quincy Adams. In 1836 Rush was the U.S. government's agent to receive the James Smithson bequest in London, his first connection with what became the Smithsonian. His last public service came as minister to France from 1847 to 1849. He died in Philadelphia on July 30, 1859.

Rush was a prolific writer, the best known of his works being his account of his English mission published at various times as *Memoranda of a Residence at the Court of London.* He is remembered as a cultivated gentleman who held high office and participated in important events without shaping them.

See John H. Powell, *Richard Rush: Republican Diplomat, 1780–1859* (1942). (A. De C.)

RUSH, WILLIAM (1756–1833), U.S. sculptor and woodcarver, considered to be "the first native American to devote himself seriously and successfully to sculpture" (Henri Marceau, *William Rush, the First Native American Sculptor,* Philadelphia Museum of Art, 1937), was born in Philadelphia, Pa., on July 4, 1756. He was trained as a maker of ornamental ship carvings and figureheads. During the Revolution he served in the American army and shortly after the close of the war he set up a shop in Philadelphia. He was one of the founders of the Pennsylvania Academy of Fine Arts (1805) and served for many years as a member of the Philadelphia city council. A number of his wood carvings are preserved in various Philadelphia institutions, among the most interesting of which are his vigorous self-portrait (Pennsylvania Academy of Fine Arts), the "Water Nymph and Bittern" (Fairmount Park), two allegorical figures, "Comedy" and "Tragedy" (Philadelphia Museum), and a statue of George Washington (Independence Hall). Few, if any, of his ship carvings and figureheads survived. Rush died at Philadelphia on Jan. 17, 1833. (A. T. G.)

RUSH, the name of any of a variety of flowering plants distinguished by cylindrical stalks or hollow, stemlike leaves. The common rushes of the genus *Juncus* in the family Juncaceae (*q.v.*) are used in many parts of the world for chair bottoms, mats, and basketwork, and the pith serves as wicks in open oil lamps and for tallow candles—hence the term rush light. The fibrous stems and leaves of the bulrush, reed mace, or cattail, *Typha angustifolia,* are used in north India for ropes, mats, and baskets. *Scirpus* and other Cyperaceae are used for chair bottoms, mats, and thatch; the rush mats of Madras are made from a species of *Cyperus.* The sweet rush, yielding essential oil, is a grass, *Cymbopogon citratus,* known also as lemongrass. Quantities of the horsetail, *Equisetum hyemale,* are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces because of the silica the plant contains. Flowering rush is *Butomus umbellatus;* wood rush is the common name for *Luzula* (*see* Juncaceae). *Acorus calamus* (family Araceae), sweet flag, is also known as sweet rush.

RUSHMORE, MOUNT: *see* Mount Rushmore National Memorial.

RUSHWORTH, JOHN (*c.* 1612–1690), English historian, whose *Historical Collections of Private Passages of State* (7 vol., 1659–1701; 8 vol., 1721), covering 1618–49, remains a valuable source of information on events leading up to and during the Civil War, was born in about 1612, of an old Northumberland family. He studied law, perhaps at Oxford (of which university he became M.A. in 1649), and in 1638 was made solicitor to the town of Berwick-upon-Tweed. He was enrolled at Lincoln's Inn in 1640 and called to the bar in 1647. Always more interested in politics than in common law, during the intermission of parliaments

(1629–40) he attended, and made shorthand notes of, all important political and judicial proceedings heard before the Star Chamber, the court of honour and the king and council. In 1640 he was appointed assistant clerk to the house of commons and he recorded events on Jan. 4, 1642, when Charles I attempted to arrest five members of parliament. He also took notes at the trials of John Hampden (1637) and Strafford (1641). After the outbreak of war he acted as a messenger between parliament and its committees at Oxford and York, and from 1644 to 1647 he was licenser of pamphlets. He himself published a number of the newssheets that preceded the establishment of regular newspapers —*e.g.*, the daily *London Post* (1644–45; 1646–47), the *Kingdomes Weekly Post* (1643–1644)—and also the parliamentary pamphlets opposed to the royalist *Mercurius Aulicus*.

As secretary (1645–50) to Sir Thomas Fairfax, general of the New Model army, Rushworth had considerable importance. He was with Fairfax at the battle of Naseby and, for a short time in 1650, was secretary to Richard Cromwell. He was employed by the council of state and during the protectorate and, after Cromwell resigned, by the Rump. In 1657, 1659, 1660, 1679 and 1681 he represented Berwick in parliament. At the Restoration, Rushworth made peace with Charles II, and, although called to give information on the activities of the regicides, was not himself implicated. In 1667 he became secretary to the lord keeper and, later, agent to the colony of Massachusetts. Despite his many emoluments and an inherited estate, he fell into poverty and spent his last years in a lodging in the king's bench prison, Southwark, where he died on May 12, 1690.

Rushworth's *Historical Collections* was compiled from his own notes and from printed material, with the avowed intention of making it possible for a true history to be written of events which, in pamphlets and newssheets dating from the period before the control of the press, were liable to misrepresentation. It is most useful for its eye-witness accounts of Strafford's trial, the battle of Naseby and the parliamentary campaigns of 1644–45, and for its transmission of contemporary comment.

RUSKIN, JOHN (1819–1900), writer, critic and artist, who more than anyone else influenced the public taste of Victorian England and did much to inspire the opposition to a *laissez-faire* philosophy, was born in Bloomsbury, London, on Feb. 18, 1819. His grandfather was gifted, spendthrift and a little mad, and finally killed himself. His parents recognized a dangerous precocity and an unstable genius in their child and sheltered him from contact with reality. At the same time they checked and restrained him and allowed him little spontaneity of interest or action.

The father, John James Ruskin, was a successful wine merchant. He had a liking for pictures and when he toured England to solicit orders, used to see the galleries in the great houses, accompanied, in time, by his son. The Ruskins moved to Herne Hill, on the southern outskirts of London, when Ruskin was 4, and to Denmark Hill, near Dulwich, when he was 20. His natural appetite for pictures found satisfaction in the Dulwich Art gallery, and the pictures there exhibited remained the basis of his thoughts on art long after he was free to seek wider knowledge.

The Dulwich gallery, constant reading of the Bible with his mother and of the 18th-century classics with his father, and his father's encouragement of his facile talents in writing and drawing were the most valuable part of his education. His father's interest in art secured him drawing lessons from the water-colorist Copley Fielding. When he was 14 the family began a series of tours in Europe, of a most conventional kind—northern France, Flanders, the Rhine, the Black Forest and Switzerland. In the Alps he found the beauty and sublimity that he needed, and he justified his love of them (since the moral preoccupations of his parents and his own untried powers of expression made justification necessary) by amateur geologizing and botanizing.

THE BETTMANN ARCHIVE INC.

JOHN RUSKIN

When he was 17 Ruskin fell in love with Adèle Domecq, the daughter of his father's Spanish partner. The frustration of this affair seems to have been the effective cause of a permanent failure to attain emotional maturity which left him vulnerable and incomplete.

In 1836 Ruskin went up to Christ Church, Oxford, where his studies were desultory and his social life hampered by his mother's presence in lodgings nearby. Nonetheless he had got away from the suburbs and made friends—chief among them Henry (later Sir Henry) Acland, who became regius professor of medicine—who were permanently to enrich his life. He won the Newdigate prize for poetry in 1839 and, because of a generous allowance from his father, was able to begin to collect pictures by J. M. W. Turner.

First Visit to Italy.—Ruskin's time at Oxford was interrupted suddenly in the spring of 1840 when he suffered a hemorrhage which the doctors considered to be of phthisic origin. They advised that he should winter abroad, and the family departed for Italy. Ruskin made many sketches in the course of the long leisurely journey, but in Rome, where he made friends with the artist George Richmond, he began to have a clearer idea of the difference between amateur and professional work. They went on to Naples, where he had another attack, but on the return journey by Venice through Switzerland he regained energy and hope. He found himself able to see natural beauty in all its gamut—from great mountains to minute plants—with a new vividness, and devoted himself to describing it with artistry.

Ruskin returned to Oxford in the autumn and took the pass schools creditably in the spring of 1842. The Ruskins spent the summer at Chamonix, France. There John began to plan a book in defense of Turner, whose late style had been exemplified in his Academy pictures of that year, which had been laughed at by the critics. Returning to a new house on Denmark Hill, he began to work seriously at the National gallery and at Dulwich and to write the first draft of what was to become the first volume of *Modern Painters*. He set out to examine the "truth to Nature" of the accepted masters of landscape painting, always with the glorification of Turner in mind, and in his descriptions of landscape, in Italy and in the Alps, gave rein to his own capacity for word painting. The book appeared in May 1843, when Ruskin was just 24. It had a considerable success, though Turner himself showed nothing but embarrassment. Ruskin immediately set to work on a second volume which had no such definite scheme as the first and contained even more of the author's sensibility—a sensibility that had by then escaped from Protestant inhibitions in the study of religious painting.

Second Visit to Italy; Marriage.—In April 1845 he set out on a journey that was to mark a new stage in his development. Together with a valet and an elderly mountaineer guide, and without his parents, he set forth to explore north Italy and found in its medieval architecture and sculpture a romantic beauty he had not known before. The sketches he made were the best he ever achieved; the things he saw were forever imprinted on his memory; for once he was really happy.

When he returned to Denmark Hill it was to complete the second volume of *Modern Painters* in less congenial surroundings. It appeared in April 1846. A subsequent journey to Italy with his parents, to show them the beauties he had lately discovered, was an anticlimax and led to an attack of nervous depression. On their return he began to think of marriage, and with hesitant encouragement from his parents became engaged to Euphemia Chalmers (Effie) Gray, the pretty daughter of Scottish friends of the family, whom he married in April 1848. He was completely self-centred and very gifted; she was rather demanding, a born social climber and essentially commonplace. It is not surprising that the marriage (which was never consummated) was not a success.

After a few months in London, where Effie was determinedly social, in August they visited northern France, for Ruskin had

it in mind to write a book on the essential qualities of Gothic architecture. By April *The Seven Lamps of Architecture* was finished. The book had a considerable success. It took the fruits of the labours of a generation of medievalists and gave them a generalized basis and a moral flavour; and it was extremely well-written. In the autumn of 1849, the young Ruskins went to Venice for the winter. Ruskin wished to apply the general principles of *The Seven Lamps* to Venetian architecture, and to relate its rise and fall to the working of moral and spiritual forces. He worked hard; *The Stones of Venice* duly appeared in 1851. In the course of 1851 Ruskin was induced to champion the Pre-Raphaelite brotherhood (*q.v.*), less because he admired them from the first than because he thought the critics unfair to them. He befriended Dante Gabriel Rossetti, who disliked him; established a lasting and happy friendship with Edward Burne-Jones; and he cultivated the company of John Everett Millais, with the result that the artist and Effie fell in love. As soon as Millais had been elected a member of the Royal Academy, with an assured future, Effie left Ruskin. In July 1854 she secured an annulment of her marriage on the ground of her husband's impotence, and a few months later married Millais.

Return to Denmark Hill.—Ruskin was back in the old narrow circle of Denmark Hill. His only escape was to rather futile teaching at the Working Men's college, established in 1854 by J. F. D. Maurice (*q.v.*), whom he did not like, and in sitting at the feet of Thomas Carlyle, who made him waste a good deal of time on causes irrelevant to his real interests. The third and fourth volumes of *Modern Painters* were written on an increasingly authoritarian note, and by the middle of 1855 he felt written out. His chief interest was in the construction of the Oxford University museum under the aegis of his friend Acland, according to his own principles of Gothic beauty. He offered to undertake the sorting and arrangement of the mass of drawings that Turner had left to the National gallery and from Feb. 1857 for about a year they were his chief occupation. He gave a good many lectures, less on art pure and simple than on its implications. In those on "The Political Economy of Art" (1857)—later retitled *A Joy for Ever*—he first entered the field of economics, with an able and effective disquisition on economy as "the art of managing labour."

In 1858, again alone but for a valet and the old guide, he spent six weeks in Turin, Italy, and recaptured the magic of the mature Renaissance in the paintings of Paolo Veronese. The fifth volume of *Modern Painters* (1860), written in the winter of 1858–59, is largely influenced by these interests. The volume is extremely disconnected; and indeed, Ruskin's mind was gradually declining into madness. He fell in love with a hysterical young Irish girl of good family, Rose La Touche, who, when he first knew her, was a child of ten; when she was 16 he declared himself to the parents, who were horrified. Soon after, Rose fell mentally and physically ill, and the affair dragged sadly and hectically on until her death in 1875. During these years Ruskin became a habitué of Miss Bell's girls' school at Winnington, in Cheshire, where the company of the children provided a refuge; some of his books—notably *The Ethics of the Dust* (1866)—were developed from talks he gave to her pupils. His only important work at this time was a set of essays on the nature of wealth that he wrote in 1860. His views (based to some extent on those of the reformer and socialist Robert Owen [*q.v.*]) included the theory of social justice and were utterly contrary to the *laissez-faire* Benthamite doctrines of the time. The *Cornhill* began to publish the essays, but they roused so much opposition among its readers that after the fourth essay Thackeray, as editor, discontinued them. Ruskin published them as a book under the title *Unto This Last* (1862).

He was near a breakdown, and retired for a time to Mornex near Geneva. He returned in time for his father's last illness and death in March 1864 and continued to live with his aging mother at Denmark Hill. His father left Ruskin £120,000, various properties and a fine collection of pictures; but he had neither peace of mind nor strength of purpose left. He wrote no more on art, except as a part of his social and economic theories, and when he travelled he was apt to delegate the making of sketches to artists whom he took with him.

Last Years.—In 1869 he was elected the first Slade professor of fine art at Oxford, and he had a great personal success as a lecturer, though his lectures were diffuse and on many subjects other than art. He gave a collection of prints, photographs and drawings for undergraduates to study; he set up a drawing school for them; and he encouraged them to build a road across the wet fields at Hinksey. He had a need to address himself to those of another intellectual class than himself, and wrote two series of letters to workingmen, *Time and Tide* (1867) and a much longer set, *Fors Clavigera* (1871–87). The last was the organ of the Company of St. George, which he founded in 1871 and endowed with a capital of £10,000. It was intended to carry out his economic doctrines; every "companion" was to give it a tenth of his income, and for many years Ruskin did. Its activities were often ill-judged and were usually unfortunate; a museum of art at Sheffield was the most successful. Bouts of illness interrupted work at Oxford and the publication of *Fors;* after his mother's death in 1871 Ruskin sold the house at Denmark Hill and bought an ugly residence, Brantwood, beautifully situated on Coniston water in the Lake district, where he spent much of his time, with a married cousin to keep house for him. He began to be obsessed with the idea of the "Storm-Cloud and Plague-Wind" which were everywhere defiling natural beauty, and finally in 1878 suffered some months of acute mania. Early in 1879 he resigned his professorship, giving as his excuse that James Whistler (*q.v.*) had won a libel action against him for his intemperate criticism of one of the "Nocturnes."

His intellectual life was over. He showed improvement in 1880–81 and even resumed work at Oxford, with grotesque and tragic results. The years that followed were checkered by attacks of mania; yet it was in these years that he wrote the most charming of his works, the autobiography called *Praeterita* (1885–1900). It offered escape from the present and, since he had kept a diary for much of his life, he had materials to work on. It was never finished; after a sixth attack of madness in the summer of 1889 he was incapable of writing anything but his signature. He died on Jan. 20, 1900, and was buried at Coniston, Lancashire.

Ideas, Influence and Personality.—A Wordsworthian in his love of nature, and of mountain scenery in particular, Ruskin founded an aesthetic canon upon truth to nature in landscape painting, contrasting, in *Modern Painters,* the sensitive accuracy of Turner in this respect with the conventionalism of Claude Lorrain. He found the same truthfulness in union with religious feeling in Gothic architecture and in the natural forms of its decoration carved with delicate reserve by devoted craftsmen. The gesticulation of baroque and its urns, scrolls, obelisks and drums—forms not found in nature—seemed artificial and false to him and thus, in his view, constituted bad art. From his conception of good art as a permanent repository of natural truth, which was its source, and of moral feeling, which inevitably accompanied it, proceeded his ideal view of the workman, whether craftsman or manual labourer, as a dedicated individual who needed to find fulfillment through doing satisfying work with a valid purpose. Social justice required the creation of conditions which would permit all to share with the creative artist the opportunity for work of this kind, for they were not generally to be found in the heedless economic expansion of 19th-century England. Thus he was led from criticism and exposition of art to a concern with social welfare, advocating better housing, a system of national education for children and adults, old-age pensions (measures commonplace enough since, but revolutionary then); and he used his wealth in the service of these ends. Yet it is in the world of art that Ruskin is perhaps remembered best. His vision of Gothic as the norm of true art and moral value gave a new significance to its study by architectural historians and accorded so well with the feeling of the age that he was able to lend authoritative support to the carrying out of a great deal of public building in Victorian England in the neo-Gothic style.

John Ruskin was a man of true originality. His literary style, though it has echoes of the Authorized (King James) Version of the Bible and of writers such as Richard Hooker and Dr. Johnson, is nonetheless unmistakably his own; his ideas might owe something to Plato and much to the Bible, but he wrought them in his own fashion. He was a completely honest and curiously innocent

man. As a rich man's son he was free to work at what he liked. He endured a measure of drudgery when he wrote the historical sections of *The Stones of Venice* and when he sorted and arranged the Turner drawings at the National gallery, but in the main he wrote easily of what interested him. This amateur quality gives a characteristic sparkle and zest to his treatment of all his themes, and they were many. His originality and his intellectual self-indulgence were inextricably mixed with his psychological weakness. He is the archetype of the manic-depressive, swinging from elation to misery, always sensitive and always expressive. The narrow religiosity of his early upbringing, his lack of systematic education and his mother's overanxious care did nothing to give him the poise and repose that might have helped him to keep a balance; and two frustrated love affairs and an unhappy marriage removed any hope of emotional maturity.

Yet, in spite of these disabilities (and sometimes because of them), he was able to perceive beauty with an infectious intensity, and to express his perception in memorable prose. He was one of the first to bring the work of art into relation with its creation and with the age in which he lived, and one of the first to preach with some effect that a respect for art must be a part of civilization. He inspired William Morris to create the Society for the Protection of Ancient Buildings, and preached the necessity for a National Art Collections fund a generation before one was founded. He included visual training in his educational schemes. He made the social condition of the workman a part of the judgment both of the work of art and of manufacture on a larger scale. It is easy and partly true to say that he lost the battle against the doctrines and practice of Manchester (*i.e.*, the political economists who followed John Bright in advocating *laissez-faire*), yet many of his words did not fall on stony ground. No one who has read any of his more important works seriously will ever be quite free from his influence; in what he wrote there was always an element of single-minded nobility. No picture of the Victorian age can be complete without him.

Viljoen, *Ruskin's Scottish Heritage* (1956); John D. Rosenberg, *The Darkening Glass: a Portrait of Ruskin's Genius* (1963).

(J. Ev.)

RUSSELL, the name of a famous English Whig family, the senior line of which has held the title of duke of Bedford since the late 17th century, and which first acquired prominence under the Tudor sovereigns.

The first member of the family whose existence can be proved was STEPHEN RUSSELL (d. 1438/39). Dorset records of the late 14th and early 15th centuries show him as a small merchant, often giving him the alias of Gascoigne. An alias was a common means of identification; this one possibly indicates that Russell's origin was in Aquitaine or it may merely have referred to his trading interests. He was married (*c.* 1400) to Alice de la Tour, daughter of John de la Tour of Dorset, who held some property in the county. The most important of these properties was the small manor of Berwick upon Swyre, about five miles inland and to the westward from Weymouth; but in this manor Alice brought Stephen only a reversionary interest. Stephen took his part in local affairs and may have represented Weymouth in the Parliament of 1394.

Stephen's son HENRY RUSSELL (d. 1463/64) lived much the same life as his father, but more details of his activities have survived. He also took part in local affairs and traded with France. He represented Weymouth in the Westminster parliaments of 1425, 1427 and 1441–42. His wife was Elizabeth Herring, daughter of John Herring of Chaldon-Herring in Dorset, a small landowner. Henry prospered, and came to own four or five ships trading from Weymouth to France and Spain. He also rose in status. When he obtained a pardon for having neglected some duties as bailiff, his description was given as "Henry Russell of Weymouth otherwise called Henry Russell of Weymouth merchant, otherwise called Henry Gascoigne of Weymouth Gentilman . . . or by whatsoever name he may be styled."

A more significant development, however, was that Henry acquired a coat of arms, a fact which only again came to light two centuries later. Henry died between October 1463 and October 1464, and was buried in the church of the Holy Trinity in Dorchester, where he had a house. Early in the 17th century the church was destroyed by fire, and the reigning Russell—Francis, 4th earl—sent an emissary to Dorchester to investigate the damage. He received a report that the tomb had been destroyed, but that lying on the ground was part of a coat of arms showing "a lion rampant gules on a chief three scallop shells impaling a shield bendy argent and gules." Here, presumably, was the first representation of the Russell arms.

JOHN RUSSELL (*c.* 1432–1505), Henry's son, was married to Elizabeth Froxmere, who may have belonged to a Worcestershire family of that name. Nothing is known of his activities, but he and his wife are commemorated by a mural tablet of 1505, still existing in the church of the Holy Trinity at Swyre. This may well point to the fact that the reversion of the manor of Berwick had now fallen in, and that John lived there.

JAMES RUSSELL (d. 1505/06), John's heir but not necessarily his son, lived at Berwick with his wife, Alice Wyse, who came of a Devonshire family. They, too, are commemorated by a mural tablet in the church at Swyre, dated 1509.

Neither of the two generations succeeding Henry Russell was particularly outstanding. But the son of James and Alice, JOHN RUSSELL (*c.* 1485–1555), made his mark in history. After the accession of Henry VIII he advanced rapidly, serving the crown as soldier and diplomatic agent. Under Edward VI and Mary I he was keeper of the privy seal. After his defeat of the western rebels in August 1549 he was created earl of Bedford in January 1550. For details of his career and of those of his successors, earls and dukes of Bedford, *see* BEDFORD, EARLS AND DUKES OF. Three of the four sons of FRANCIS (*c.* 1527–1585), 2nd earl of Bedford, died before him; the third, killed in a border fray, was father of EDWARD (1572–1627), 3rd earl, who died without issue. Francis' fourth son, WILLIAM (*c.* 1558–1613), created Lord Russell of Thornhaugh in 1603, was a soldier who fought at Zutphen (1586) beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing (1587–88), and was from 1594 to 1597 lord deputy of Ireland. His only son, FRANCIS (1593–1641), succeeded his cousin as 4th earl of Bedford in 1627. WILLIAM (1616–1700), eldest surviving son of the 4th earl, succeeded as 5th earl and became 1st duke of Bedford. The youngest son of the 4th earl, Edward, was father of EDWARD RUSSELL (1653–1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue (1692) against the French, was created earl of Orford in 1697.

LORD WILLIAM RUSSELL (*q.v.*), third son of the 1st duke, supported the unsuccessful attempts to exclude James, duke of York (afterward James II), from the throne. He was unwise enough to mix with conspiratorial associates and after the exposure of the alleged Rye House Plot (1683) was found guilty of attending a meeting at which treason had been talked. He was executed at Lincoln's Inn Fields on July 21, 1683.

LORD JOHN RUSSELL (1792–1878), third son of the 6th duke of Bedford, was the statesman whose name is particularly connected with projects for parliamentary reform and who was created, in 1861, Earl Russell of Kingston Russell (*see* RUSSELL, JOHN RUSSELL, 1st Earl). His nephew, Odo Russell, was ambassador at Berlin from 1871 until his death in 1884, and was created Lord Ampthill in 1881 (*see* AMPTHILL, ODO WILLIAM LEOPOLD RUSSELL, 1st Baron). Lord John's grandson, BERTRAND ARTHUR WILLIAM RUSSELL, 3rd Earl Russell (*q.v.*), is the well-known philosopher.

See G. S. Thomson, *Two Centuries of Family History* (1930), *Family Background* (1949).

(G. S. T.)

RUSSELL, BERTRAND ARTHUR WILLIAM RUSSELL, 3RD EARL (1872–), English philosopher, famous also for his eloquent championship of individual liberty, which made his position in the intellectual life of his time comparable with that of Voltaire in the 18th century or with that of J. S. Mill in the 19th, was born on May 18, 1872. His grandfathers were Lord John Russell (afterward Earl Russell) and the second Lord Stanley of Alderley. His godfather (in a purely social sense) was J. S. Mill. At the age of three he was left an orphan. His father, Lord Amberley, had wished him to be brought up as an agnostic; to avoid this he was made a ward of court and brought up by his grandmother at Pembroke lodge, in Richmond park. Instead of being sent to school he was taught by governesses and tutors and thus acquired his perfect knowledge of French and German. In Oct. 1890 he went into residence, as a shy undergraduate, at Trinity college, Cambridge. After being a high wrangler and obtaining a first class with distinction in philosophy he was elected a fellow of his college in the autumn of 1895. But he had already left Cambridge in the summer of 1894 and for some months was attaché at the British embassy in Paris.

In Dec. 1894 Russell married Alys Pearsall Smith. After spending some months in Berlin studying social democracy (*German Social Democracy,* 1896), they went to live near Haslemere, where he devoted his time to the study of philosophy and wrote *A Critical Exposition of the Philosophy of Leibniz* (1900). He published *The Principles of Mathematics* in 1903 and then, with his friend A. N. Whitehead, proceeded to develop and extend the mathematical logic of Giuseppe Peano and Gottlob Frege. The three volumes of their joint book, *Principia Mathematica,* were published in 1910, 1912 and 1913. During all this period Russell lived simply and worked hard. He was elected a fellow of the Royal society in 1908 and was appointed lecturer at his old college in 1910. In 1910 also he published *Philosophical Essays,* republished in later editions from 1918 as *Mysticism and Logic, and Other Philosophical Essays.*

After World War I broke out he took an active part in the No Conscription fellowship. He was fined £100 as the author of a leaflet criticizing a sentence of two years on a conscientious objector. His library was seized to pay the fine; it was bought in by a friend, but many valuable books were lost. His college deprived him of his lectureship. He was offered a post at Harvard university, but was refused a passport. He intended to give a course of lectures (published in the U.S. as *Political Ideals* in 1918) but was prevented by the military authorities. In 1918 he was sentenced to six months' imprisonment for a pacifist article he had written in the *Tribunal.* His excellent *Introduction to Mathematical Philosophy* (1919) was written in prison. *The Analysis of Mind* (1921) was the outcome of some lectures that he gave in London, a few friends having raised a subscription for the purpose. *The Practice and Theory of Bolshevism* (1920) was written after a short visit to Russia.

In the autumn of 1920 he went to China to lecture on philosophy at the Peking university. On his return in Sept. 1921, having been divorced by his first wife, he married Dora Black. He then earned a livelihood by lecturing, journalism and writing popular books such as *The A.B.C. of Atoms* (1923), *The A.B.C. of Relativity* (1925) and *On Education* (1926). Other publications of this period were the introduction to the second edition of *Principia Mathematica* (1925); *The Analysis of Matter* (1927); *An Outline of Philosophy* (1927); *Marriage and Morals* (1929). In 1927 he and his wife started a school for young children, which they managed until 1932. He succeeded to the earldom in 1931. Divorced by his second wife in 1935, Russell the following year married Patricia Helen Spence, with whom he published *The Amberley Papers* (1937). In 1938 he went to the United States, where he taught at many of the leading universities. When his appointment to teach philosophy at the College of the City of New York (1940) was cancelled because of his views on morality Russell accepted a five-year contract as a lecturer for the Barnes foundation, Merion, Pa., but cancellation of this was announced in Jan. 1943.

After 1944 Russell lived mostly in England, becoming well known to large audiences through his broadcasts, which included the first series of Reith lectures (*Authority and the Individual,* 1949). He received the Order of Merit in 1949 and the Nobel prize for literature in 1950. In 1952 he was divorced for the third time and married Edith Finch. A collection of five short stories appeared under the title *Satan in the Suburbs* in 1953.

Apart from those already mentioned, Russell's writings include *The Conquest of Happiness* (1930); *The Scientific Outlook* (1931); *Education and the Social Order* (1932); *Freedom and Organisation, 1814–1914* (1934); *Power: a New Social Analysis* (1938); *An Inquiry Into Meaning and Truth* (1940); *A History of Western Philosophy* (1945); *Human Knowledge, Its Scope and Limits* (1948); *Unpopular Essays* (1950); *New Hopes for a Changing World* (1951); and *Human Society in Ethics and Politics* (1954). (C. P. SA.; W. C. K.)

Philosophy.—What is fundamental in Russell's philosophy is his logic: his views on metaphysics and ethics, on the nature and relations of matter and mind, changed profoundly in the course of his life, but these changes all proceeded from successively deeper applications of his logical method. He, therefore, preferred to classify his philosophy not as a species of idealism or realism but as "logical atomism," since what distinguishes the whole of his work is his use of logical analysis as a method and his belief that by it we can arrive at ultimate "atomic facts" logically independent both of one another and of being known.

First Russell tried to free logical analysis from the domination of ordinary grammar by showing that the grammatical form of a sentence often fails to reflect the logical form of its meaning. In his *Principles of Mathematics* he insisted that relations could not be reduced to qualities of their terms and that relational facts were not of the subject-predicate forms, but he still thought that any descriptive phrase which could be made the subject of a sentence must stand for a term which had being, even if like "the round square" it were self-contradictory. In his article "On Denoting" (*Mind,* 1905) and in subsequent writings, he put forward his theory of descriptions, which is perhaps the most important and influential of his innovations in logic. According to this theory "the present king of France" is not a name for a nonexistent entity but an "incomplete symbol" which only has meaning in connection with a context. The meaning of such a statement as "the present king of France is bald" is first that there is someone who is at present both king of France and bald and secondly that there are not at present two kings of France; and when such statements are analyzed in this way the need to believe in entities such as "the present king of France" (which are said by some philosophers to have "being" but not "existence") is altogether removed. Similarly when it is said that "unicorns are not real," this does not mean that certain animals, namely unicorns, lack the characteristic of reality but that there are no horselike animals with one horn.

Russell applied similar methods to classes and to numbers and argued that each of these categories consists of what he called "logical constructions." In saying, for instance, that classes are logical constructions, he did not mean that they are entities constructed by the human mind, but that when we express facts by sentences which have for subject such a phrase as "the class of men," the true analysis of the fact does not correspond to the grammatical analysis of the sentence. When, for instance, we say "the class of men includes the class of criminals," the fact asserted by us is really about the characteristics of being a man and being a criminal and not about any such entities as classes at all. This notion of a logical construction was much employed by Russell in his work in mathematical logic, and he also used it extensively in the philosophy of matter and mind, and even adopted as a fundamental principle that constructions (in his special sense of the word) are to be substituted for inferred entities wherever possible.

By applying this method he was led to a view of the world on which the ultimate constituents of mind and matter are of the same type, the difference between minds and bodies lying in their structure and not in the elements of which they are composed. A man's mind is composed of sensations and images, which are identified by Russell with physical events in his brain, and the difference between physics and psychology lies not in the events which they

study but in the kind of laws about those events which they seek to establish, physics being concerned with structure and psychology with quality. This theory was worked out in connection with physics in *The Analysis of Matter.*

In the theory of knowledge Russell's earlier rationalism was considerably modified in a pragmatist or behaviourist direction, and in *The Analysis of Mind* he rejected consciousness as a fundamental characteristic of mind and adopted a form of "neutral monism" about perception, which he combined with representationism in regard to memory and judgment.

Russell's logical atomism was the starting point for the *Tractatus logico-philosophicus* (1921) of his pupil L. Wittgenstein and so one of the sources of logical positivism. Then, after a period between World Wars I and II when it dominated the philosophy of the English-speaking world, his program was brought into doubt by the later teaching of Wittgenstein, according to which philosophical difficulties arise not from any inadequacy of ordinary language but from failure to respect the limits of normal usage. In his later writings Russell showed misgivings about logical atomism, but for different reasons. He came to think that there might be necessary connections between distinct events.

Mathematics.—Russell maintained that mathematics and formal logic are one and that the whole of pure mathematics can be rigorously deduced from a small number of logical axioms. He argued this in outline in *Principles of Mathematics* and then tried to give a detailed demonstration of his thesis in *Principia Mathematica,* written with A. N. Whitehead. In this colossal work the deduction is carried so far as to include all the essential parts of the theory of aggregates and real numbers. Besides this the great advances made by Russell in the analysis of logical concepts allowed the deductions to be carried not only much farther forward but also much farther backward toward first principles. Above all he appeared to solve the notorious paradoxes of the theory of aggregates by means of the theory of types. In this connection, however, he found it necessary to introduce an "axiom of reducibility" which has never won general acceptance, so that his work cannot be regarded as a final solution of the problem.

See MATHEMATICS, FOUNDATIONS OF; *see* also references under "Russell, Bertrand Arthur" in the Index. (F. P. R.; W. C. K.)

RUSSELL, CHARLES TAZE (PASTOR RUSSELL) (1852–1916), founder of the International Bible Students association, forerunner of the modern Jehovah's Witnesses (*q.v.*), was born at Pittsburgh, Pa., on Feb. 16, 1852. Of Presbyterian and Congregationalist background, Russell renounced the creeds of orthodox Christian denominations and in 1872 organized an independent Bible study class in Pittsburgh. From 1877 he preached that Christ's second advent would be invisible, that the end of the Gentile times would come in 1914, followed by war between capitalism and communism or socialism, after which God's Kingdom by Christ would rule the whole earth. Russell (who, though popularly called Pastor Russell, was never ordained) dedicated his life and his considerable fortune to preaching Christ's millennial reign. In 1879 he started a Bible journal later called the *Watchtower.* His wife disputed editorship and eventually sought legal separation, which was granted; she never sought nor obtained absolute divorce. The *Washington Post* and *Chicago Mission Friend* charged marital promiscuousness, but Russell sued both papers for libel and won both cases.

Russell's religious stand opened the door for a number of controversial incidents publicized during his life. One such incident in 1911 involved a gift to Russell's organization of a quantity of "miracle wheat" (so named by its discoverer), which, at the donor's request, was sold, the proceeds (about $1,800) to be applied to charitable work. Russell in 1884 founded the Watchtower Bible and Tract society, which became a flourishing publishing business. His own books and booklets (notably six volumes of *Studies in the Scriptures*) reached a circulation of 16,000,000 copies in 35 languages, and 2,000 newspapers published his weekly sermons. Russell died on a train in Pampa, Tex., on Oct. 31, 1916, while on a speaking tour.

See M. Cole, *Jehovah's Witnesses—the New World Society* (1955). (M. Co.)

RUSSELL, GEORGE WILLIAM (1867–1935), Irish poet and mystic, better known by his pseudonym, "Æ," was a leading figure in the Irish literary revival. He was born at Lurgan, County Armagh, on April 10, 1867, and educated at Rathmines School. He also attended the Metropolitan School of Art, Dublin, where he met W. B. Yeats. He became an accounts clerk in a drapery store but left in 1897 to organize agricultural cooperatives, becoming editor in 1906 of *The Irish Homestead* and in 1923 of *The Irish Statesman,* both cooperative organs.

In 1894 Russell published the first of many books of verse, *Homeward: Songs by the Way.* His first book of *Collected Poems* appeared in 1913, and a second in 1926. In 1935, the year of his death, he published his *Selected Poems,* containing all he wished to preserve. He was interested all his life in theosophy, the origins of religion and mystical experience, and was reputed to see frequent visions. *The Candle of Vision* (1918) is the best guide to his religious beliefs, while *Co-Operation and Nationality* (1912) and *The National Being, Thoughts on an Irish Polity* (1916) reflect his political and economic interests. He remained true to his early interest in painting, but his work lacks intensity and it was as a poet that he hoped to be remembered.

There is rather too much of the "Celtic twilight" in his verse, and it suffers also from the vagueness and imprecision of the accepted poetic diction of his youth; but in a handful of pieces, notably "Immortality," "The Twilight of Earth," "On Behalf of Some Irishmen Not Followers of Tradition," and "Companions," and especially, perhaps, in "Germinal," he memorably transcends these limitations. Russell died at Bournemouth on July 17, 1935.

RUSSELL, HENRY NORRIS (1877–1957), U.S. astronomer, the inventor (with the Danish astronomer Ejnar Hertzsprung) of the "Hertzsprung-Russell diagram," was one of the most important influences in the development of 20th-century astrophysics and stellar astronomy. He was born at Oyster Bay, N.Y., on Oct. 25, 1877, and died in Princeton, N.J., on Feb. 18, 1957. After attending Princeton university he went to Cambridge, Eng., where he was engaged in the determination of stellar parallaxes by photography—a method which at that time (1903–05) was in its infancy.

Russell returned to Princeton in 1905 to embark on a long and brilliant career in astronomy. His work included investigations in almost every field of modern astronomy, as well as in spectroscopy. He developed a method for the determination of the dimensions of double stars whose components periodically eclipse each other; in addition, he and Hertzsprung independently discovered a way to determine the distances from the solar system of double stars which are observed through the telescope to be in revolution about their common centre of gravity. The diagram known variously as the Russell diagram or Hertzsprung-Russell diagram was formulated in its modern form by Russell in 1913. The information which it gives about the stars is fundamental and its uses are varied. The diagram illustrates the relationship between the spectral types (that is to say, surface temperatures) and absolute magnitudes of the stars. (The absolute magnitude is a measure of the true brightness—as distinguished from the apparent brightness—of a star.)

The theory of stellar evolution advanced by Russell in 1913 was favoured almost universally for many years thereafter; although it is no longer supported, its importance in the development of the subject was great. Russell was one of the most active workers in the analysis of the line spectra of the elements and he utilized the new developments in studies of the characteristics of stellar atmospheres.

Among Russell's writings may be mentioned, *Modifying Our Ideas of Nature: the Einstein Theory of Relativity* (reprinted in the *Smithsonian Report for 1921*); *The Constitution and Evolution of the Stars* (reprinted in the *Smithsonian Report for 1923*); *The Composition of the Stars* (1933); *The Atmospheres of the Planets*

(reprinted in the *Smithsonian Report for 1935*); and *The Solar System and Its Origin* (1935). (W. W. M.)

For a description of the spectral type-absolute magnitude diagram, *see* H. N. Russell, R. S. Dugan and J. Q. Stewart, *Astronomy*, 2 vol. (1926–27; vol. i rev., 1945; vol. ii, 2nd ed., 1938).

RUSSELL, JOHN RUSSELL, 1ST EARL (1792–1878), British statesman, prime minister from 1846 to 1852 and from October 1865 to June 1866, an indefatigable champion of liberal measures and especially of parliamentary reform, whose name is particularly connected with the Reform Bill of 1832, was born in London on Aug. 18, 1792. As the third son of the 6th duke of Bedford, he was known for most of his life as LORD JOHN RUSSELL, until himself created an earl in 1861. A frail, puny child, he attended Westminster School, the traditional school of the Russells, for one year only (1803–04). In 1809 he was sent to Edinburgh University. His contacts there with such men as the mathematician and philosopher John Playfair with whom he resided and with Dugald Stewart for whose teaching he expressed gratitude in a sonnet, and his membership of the Speculative Society of which he was president (1811–12) gave direction to his thoughts and taught him the art of debate. During vacations and after leaving Edinburgh (1812) he traveled in Spain, Portugal, and Italy.

Russell's political career began when he was returned to Parliament in 1813. The trend of his mind was clearly shown in his first notable speech, when in 1817 he opposed the suspension of the Habeas Corpus Act. To Russell, bred in the Whig tradition, the proposed suspension, one of the measures designed to repress the prevailing industrial unrest, was an infringement of civil liberty. The suspension was approved; but behind the troubles new and less illiberal ideas were slowly making headway. In presenting these, young Russell was in the van. In 1819 he began his advocacy for the reform of parliamentary representation by moving an inquiry into the corruption of one particular constituency, Grampound in Cornwall, the disfranchisement of which was secured in 1821. This was a pointer to future developments. In the meantime Russell turned his attention to the question of Catholic emancipation. On this matter, then a burning issue, the Whigs stood solid. Toleration was part of their political creed. In February 1828 Russell led the attacks on the Test and Corporation acts which since the 17th century had largely restricted public office to adherents of the Church of England. The acts were repealed and this triumph was followed by the passage of a Catholic Relief Act in 1829, under threat of rebellion in Ireland.

Office Under Grey and Melbourne (1830–41).—The Tories resigned in November 1830, and Earl Grey formed the first Whig administration since 1807. Russell was paymaster general. Grey had determined on the immediate drafting of a bill for parliamentary reform, and appointed for this purpose a committee of four, including Russell. Although not yet a member of the cabinet, he was chosen to move the first reading in the House of Commons in March 1831. When, after first a dissolution and then an attempt by the duke of Wellington to form a ministry (*see* GREY, CHARLES GREY, 2nd Earl), the bill was finally passed in the House of Lords on June 4, 1832, Russell was justly regarded as its chief architect.

Russell, who had joined the cabinet in June 1831, believed that the surplus revenues of the Church of Ireland should be diverted to secular purposes. His public pronouncement to this effect in the House of Commons (May 1834) led to the resignation of Lord Stanley (afterward 14th earl of Derby), then secretary for war and the colonies, who had until recently been chief secretary for Ireland. "Johnny Russell has upset the coach," he said. Russell was often to display this habit of calculated plain speaking, but seldom to such effect. On this question and on the renewal of the Irish "coercion" bill, the ministry was seriously divided; Viscount Melbourne succeeded Grey as premier (July) and when Lord Althorp, leader of the House of Commons, succeeded his father as Earl Spencer and went to the Lords (November), King William IV dismissed the Whigs. But they returned to power in April 1835, Russell becoming home secretary and leader of the House of Commons, a situation grudgingly accepted by the king who both disliked and distrusted him. It was a weak government, owing much to the moderation of Sir Robert Peel as leader of the opposition. It did, however, pass the Municipal Corporations Act of 1835 (*see* BOROUGH) and various measures (1836–40) to reform the financial administration of the Church of England. Russell became secretary for war and the colonies in August 1839, a post which he retained until the Whigs left office after being defeated in the general election of 1841.

First Ministry (1846–52).—In November 1845 Russell addressed to his constituents in the City of London the "Edinburgh letter," that "blast from a trumpet" which announced his conversion to the view that the Corn Laws must be repealed. He was unaware that Peel, as prime minister, had already decided they must go. The actual repeal in 1846 was carried through by Peel, with Russell's support. The repeal of the Corn Laws split the Tories, and when Peel resigned after a tactical defeat on an Irish "coercion" bill, Lord John, "our little giant," became prime minister at the age of 53. His six years in office were not easy in either home or foreign affairs. He was not particularly successful in dealing with the Irish famine of 1846–47; continuing the imports of North American maize (corn), he also allowed outdoor relief (March 1847) on an enormous scale, but the problem of overpopulation was too serious to be solved other than by extensive emigration. But in the following year, 1848, the year of revolutions, his skilful handling of Chartism (*q.v.*) saved England from a dangerous situation. His reaction to the papal bull of 1850 creating Roman Catholic bishops in England was unfortunate; following popular prejudice, he attacked the Catholic hierarchy in an "open" letter to the bishop of Durham and in 1851 passed the Ecclesiastical Titles Act forbidding the assumption of titles already held by clergy of the established church. Abroad, the struggle for liberty in the countries of western Europe, the aftermath of 1848, commanded the sympathy and approval of Russell and no less of his foreign secretary Viscount Palmerston. But Palmerston often made trouble for the prime minister. Queen Victoria resented, not without reason, the foreign secretary's high-handed habit of acting entirely on his own responsibility, and her resentment was the deeper because her sympathies lay often with the European dynasties. The climax came in December 1851 when Palmerston, without reference to either queen or prime minister, sent a dispatch to Paris approving the *coup d'état* of Louis Napoleon (later Napoleon III). Russell dismissed Palmerston, but the latter had his revenge when in February 1852 he brought about, over the proposed Militia acts, the fall of the government. Although very weak, Russell's first ministry deserves to be remembered for its reforming legislation, and in particular for the passing of the Ten Hours Act (1847) and the Public Health Act (1848), and for the repeal (1849) of the Navigation acts. It was during his term as prime minister that Russell announced his conversion to the view that further parliamentary reform was essential.

Office Under Aberdeen, Palmerston, and Second Ministry.—In the earl of Aberdeen's coalition ministry of Whigs and Peelites, Russell was a member of the cabinet, briefly as foreign secretary (December 1852–February 1853), then without office and from June 1854 as lord president of the council. During the years 1853–54 he drafted a reform bill, but it was abandoned because it threatened to split the ministry, then faced with war with Russia. Russell subsequently made two serious political blunders. The first was his resignation in January 1855 over the inquiry into the conduct of the Crimean War, an act which appeared to the queen, and not to her only, completely selfish. The second was his unfortunate handling of the abortive peace negotiations at the Vienna Conference (March–April 1855), at which he was British representative (*see* CRIMEAN WAR). From 1855 to 1859 he was in the political wilderness.

In June 1859 he became foreign secretary, with Palmerston as prime minister, in the middle of the crisis of Italian unification. Russell, seeing the struggle in terms of the English Revolution of 1688, was strongly sympathetic to Italian liberalism and patriotism, and in this his sentiments were fully shared by his chief. But the queen and many of the cabinet were against him. He endured with ill grace the clipping of his forthright dispatches, but he was able to ensure that English policy favoured and assisted the Italian

cause. This was his last great consistent effort in the cause of liberty, epitomized in his historic dispatch of Oct. 27, 1860, to the British minister at Turin, favouring the union of the Two Sicilies with the kingdom of Sardinia, on the ground that "the Italians themselves are the best judges of their own interests." He was less successful in his handling of problems arising from the American Civil War, the Polish Revolution of 1863 and the Schleswig-Holstein controversy (1863–64). On the occasion of the removal of Confederate envoys from the British ship "Trent" (November 1861), his terse dispatch to Washington might have caused a serious incident had not the prince consort suggested the addition of a conciliatory clause. The following summer he was primarily responsible for allowing a privateer, constructed in England for use by the Confederates, to sail from the River Mersey (*see* "ALABAMA" ARBITRATION). In Poland his continued protests against Russian policy encouraged the continuation of a hopeless insurrection. A similar lack of realism characterized his attitude to the Schleswig-Holstein question (*q.v.*); for while, with Palmerston, he encouraged the Danes to resist Prussian pressure, his rejection of Napoleon III's suggestion of a European congress destroyed all chance of concerted action, the only means by which Denmark might have been helped.

On the death of Palmerston in October 1865, Russell, who had received an earldom in 1861, again became prime minister, but for no more than a few troubled months. His government was defeated on a new reform bill in June 1866. He then retired from politics to spend his time writing his recollections and editing documents. He settled at Pembroke Lodge in Richmond Park, Surrey, a residence presented to him in 1847 for life by the queen, and died there on May 28, 1878.

Character and Achievements.—Russell's short stature and air of frailty proved, throughout his political life, to be in the nature of a gift to cartoonists, particularly to John Doyle, and to John Leech in *Punch*. Petty in some of his attitudes, vain of his own achievements, and nepotistic, he seemed personally cold, and sometimes petulant. Further, his style of speech and writing was so terse and direct that he gave much offense, particularly to other countries when he was foreign secretary. Many of his views were narrow. He saw churches as little more than means to the ethical education of the people, and his advocacy of religious toleration was associated with strong disapproval of Roman Catholicism and of the Oxford movement. In politics he took inordinate pride in the great Whig family tradition of aristocratic liberalism (of which he justly conceived himself to be the chief exemplar in his day), the tradition of the architects of the 1688 Revolution, of Edmund Burke before the French Revolution, of Charles James Fox and Earl Grey. He edited *The Memorials and Correspondence of Charles James Fox,* four volumes (1853–57), wrote *The Life and Times of Charles James Fox,* three volumes (1859–66), and also published the correspondence of his great-grandfather, John, 4th duke of Bedford (three volumes, 1842–46). He fancied himself as a constitutional theorist, publishing in 1821 an *Essay on the History of the English Government and Constitution.* He placed the highest value on constitutional liberty, of which he had an old-fashioned individualistic conception. He was always, as foreign secretary, recommending to other countries some formal constitutional remedy for their every ill.

Nonetheless, he had great qualities. He had a powerful intellect and was courageous in overcoming his physical disadvantages. At his best he was a great parliamentarian. As Bulwer Lytton wrote in *The New Timon,* "But see our statesman when the steam is on,/And languid Johnny glows to glorious John." In later life he was overshadowed by Palmerston, who tended to dominate his foreign policy. But his achievements before 1852, and in domestic politics, were considerable. Though not a Radical, he was, despite his antiquated cast of thought, an advanced reformer in many fields. His hand is to be seen, for example, in the extension of state provision for education after 1839. He knew something of the springs of Liberal feeling in the country, and was largely responsible for keeping Whiggery radical enough to enable it to retain the leadership of the loose coalition which from 1835 to 1866 constituted the Liberal Party, and for preparing the party for the more democratic politics of the period following the Reform Act of 1867.

Russell married first in 1835 Adelaide, daughter of Thomas Lister and widow of Thomas, 2nd Lord Ribblesdale, by whom he had two daughters; he married secondly in 1841 Frances Anna Maria Elliott, daughter of the 2nd earl of Minto, by whom he had three sons and one daughter.

RUSSELL, LILLIAN (HELEN LOUISE LEONARD) (1861–1922), U.S. singer and actress who, in a variety of light roles, charmed audiences for three decades, was born in Clinton, Ia., on Dec. 4, 1861. She made her debut as a member of the chorus in *H.M.S. Pinafore* in 1879 and achieved stardom in *The Great Mogul,* a comic opera, in 1881. Subsequently she appeared in a series of comic operas in England and America, with Weber and Fields' burlesque company, in straight comedy, and in vaudeville. She was as well known for her flamboyant personal life as for her beauty and pleasant singing voice. She made only rare stage appearances after her fourth marriage, in 1912. She died in Pittsburgh, Pa., on June 6, 1922. (O. G. B.)

RUSSELL, LORD WILLIAM (1639–1683), English politician who was one of the first victims of the royalist reaction which followed the unsuccessful attempts to exclude James, duke of York (later James II), from the succession to the throne. Born on Sept. 29, 1639, the third son of the 5th earl (later 1st duke) of Bedford, he survived his elder brothers, to acquire, as heir, the courtesy title of Lord Russell in 1678. After being educated at Cambridge University, he traveled on the continent and returned to England in 1659. At the Restoration of Charles II in 1660, he was elected to Parliament for the family borough of Tavistock, in Devon, but for the next 12 years he did little in Parliament. But in 1669 his marriage to Rachel, second daughter of the 4th earl of Southampton, brought him responsibilities and an important political connection with Anthony Ashley Cooper (later earl of Shaftesbury), who had married a niece of Southampton. It also brought him a new home, Southampton House, in Bloomsbury which, with Stratton House, Hampshire, and Woburn Abbey, Bedfordshire, became one of his principal residences.

The Third Dutch War (1672–74) marked a turning point in Russell's political career. The incapacity of the Cabal administration, the distasteful association with France, and the evident encroachments of Roman Catholicism at court woke Russell to a sense of national danger and from this time he was associated with leading opposition speakers such as Lord Cavendish (later 4th earl of Devonshire), Henry Powle (Powell), Thomas Littleton, and Henry Capel in vehement criticism of the government. Never a fluent talker, he proved in a speech of Jan. 22, 1674, that he could be articulate and forceful in denouncing iniquities such as the attack on the Dutch Smyrna fleet (which had precipitated the war), the continuing "Stop of the Exchequer" (the king's postponement of the payment of interest on loans from the bankers), and "the ill ministers about the king." At the same time he joined in the proceedings against the 2nd duke of Buckingham and in 1675 in those against the earl of Danby (later duke of Leeds).

By 1678 hatred of the omnipotent Danby was so strong that his opponents were prepared to accept French assistance in thwarting his policies. Russell was certainly among those who joined in a temporary association with Louis XIV for this purpose, and he entered into close communication with the marquis de Ruvigny (later earl of Galway), who came to England in 1678 with funds for distribution among members of the opposition in Parliament. However, this was natural, for Ruvigny was Lady Russell's maternal cousin, and the testimony of Paul Barillon, the French ambassador, makes it clear that Russell's opportunism fell short of corruption. In March 1678 he seconded the address urging the king to declare war against France.

The revelations of the "popish plot" (*see* ENGLISH HISTORY)

confirmed Russell in his fears for the safety of Protestant England and he threw himself fully into the campaign to exclude James from the succession. On Nov. 4, 1678, he moved an address to the king to remove the duke of York from his person and his councils, and he began to associate himself with the group which looked to the illegitimate duke of Monmouth as a suitable heir. At the same time he encouraged Ralph Montagu (later duke of Montagu), who had married Lady Russell's stepsister, in those revelations which led to the impeachment of Danby. The dissolution of Parliament (January 1679) intervened, and in the ensuing elections Russell, who was returned for two counties, chose to sit for Bedfordshire. Danby's fall followed in April 1679 and in the same month Russell was one of the new privy council formed by Charles on the advice of Sir William Temple. Within six days, however, Russell moved for a committee to draw up a bill to secure religion and property in the event of a popish successor.

Charles had no intention of yielding influence to such a troublesome councilor and in January 1680, along with Cavendish, Capel, Powle, the earl of Essex, and Littleton, Russell tendered his resignation to the king which was received by Charles "with all my heart." On June 16 he accompanied Shaftesbury when the latter indicted James at Westminster as a popish recusant; and on Oct. 26 he took the extreme step of moving for a parliamentary decision "how to suppress popery and prevent a popish successor." He was now the leading spokesman for exclusion in the Commons, and on Nov. 2 he seconded the motion for exclusion in its most uncompromising form, carrying the bill up to the Lords on Nov. 19. He rejected the moderate scheme for imposing limitations upon James and despite the presence in England of William III of Orange (later William III, king of England), Russell resisted his influence with opposition leaders for a compromise. Instead, on Dec. 18 he proposed to refuse supplies until the king passed the Exclusion Bill, which he seconded on March 26, 1681, in Charles's last Parliament at Oxford.

With the defeat of these efforts at the dissolution (March 28), he withdrew from public life to his country seat of Stratton. Unfortunately, he was unwise enough to mix with conspiratorial associates and on one occasion in 1682 he attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Richard Hampden, Algernon Sidney, and Lord Howard of Escrick were the principals among those who compromised themselves in this way. Thus with the exposure of the alleged Rye House Plot (June 1683), of which neither he, Essex, nor Sidney had the slightest knowledge, he was plausibly accused by informers of having promoted an insurrection and of having plotted the death of the king and the duke of York. He made no attempt to escape arrest, although given opportunity, and was sent to the Tower of London on June 26, 1683. Before a committee of the privy council on June 28, Russell acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. At his trial (July 13), however, he was unable to disprove the allegations of two witnesses, and his betrayal by Lord Howard of Escrick, together with the suicide of the earl of Essex on the same day, were decisive in condemning him. Two prominent churchmen, Gilbert Burnet and John Tillotson, the earl of Anglesey, and the duke of Somerset were among those who testified for him. Bedford offered huge sums for his pardon, but Charles would only remit the sentence to be hung, drawn, and quartered to one of beheading. This was carried out in Lincoln's Inn Fields on July 21, 1683.

Within a year of the accession of William and Mary an act annulled the attainder and impugned the legality of the trial, but this was a partisan measure. However, the certainty that Russell's death had been sought in a spirit of revenge for such victims of the popish plot as Viscount Stafford, together with his blameless life in the company of a devout and intelligent wife, has made Russell an attractive figure in Whig martyrology.

See Lord John Russell, *The Life of William Lord Russell*, 2 vol. (1820); G. S. Thomson, *The Russells in Bloomsbury, 1669–1771* (1940).

(H. G. Ro.)

RUSSELL OF KILLOWEN, CHARLES RUSSELL, Baron (1832–1900), lord chief justice of England, was born at Newry, County Down, on Nov. 10, 1832, the son of Arthur Russell. The family was Roman Catholic. Educated first at Belfast, afterward in Newry and finally at St. Vincent's college, Castleknock, Dublin, he was articled in 1849 to a firm of solicitors in Newry. In 1854 he was admitted and began to practise his profession. In the legal proceedings arising out of Catholic and Orange disturbances young Russell distinguished himself in the cause of his co-religionists.

After practising for two years he determined to seek a wider field for his abilities. He went to London in 1856 and entered Lincoln's Inn. In 1858 he married Ellen, daughter of Joseph Mulholland of Belfast, and in 1859 he was called to the bar and joined the northern circuit. He possessed immense personality, an embodiment of energetic will that riveted attention, dominated his audience and bore down opposition. In his early years Russell's practice was mostly at the passage court at Liverpool, and he published a book on its procedure in 1862.

In 1872 Russell took silk, and his success as a queen's counsel during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he said, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail.

In 1880 Russell was returned to parliament as an independent Liberal member for Dundalk. From that time forward until 1894 he sat in the house of commons: for Dundalk until 1885, and afterward for South Hackney. From 1880 to 1886 as a private member, and as the attorney general in Gladstone's administrations of 1886 (when he was knighted) and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. When he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of the kingdom.

Russell rapidly became in London what he was already in Lancashire, a favourite leader in nisi prius actions (those held for trial on the issue of facts before a jury and single judge). More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of note in British history. The first of these was the Parnell commission of 1888–90, in which Russell appeared as leading counsel for Parnell. In April 1889, after 63 sittings of the commission, Russell, who had already destroyed the chief personal charge against Parnell by a brilliant cross-examination in which he proved it to have been based upon a forgery, made his great opening speech for the defense, lasting several days. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as a historical survey of the Irish question during the 19th century from the point of view of an Irish Liberal. The second was the Bering sea arbitration, held in Paris in 1893. Russell, with Sir Richard Webster (afterward Lord Alverstone), was the leading counsel for Great Britain. The award was, substantially, in favour of Great Britain.

In 1894, on the death of Lord Bowen, Russell accepted the position of a lord of appeal and was raised to the peerage. A month later he was appointed lord chief justice of England in succession to Lord Coleridge. Brief as was his tenure of the office, he proved himself well worthy of it. He had dignity without pomposity, quickness without irritability, and masterfulness without tyranny. In 1896 Lord Russell presided at the trial at bar of the leaders of the Jameson raid. His conduct of this trial, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in

the Venezuela arbitration in 1899. Lord Herschell, a British representative on the commission, died before the beginning of the proceedings, and Lord Russell took his place.

Lord Russell contributed to the reform of the law by his advocacy of improvement in the system of legal education, and in promoting measures against corruption and secret commissions, though the bills he introduced did not become law. He died on Aug. 10, 1900. Few English lawyers have ever excited the admiration abroad that Lord Russell did, both in Europe and America.

See R. B. O'Brien, *The Life of Lord Russell of Killowen* (1908).

RÜSSELSHEIM, a town of West Germany in the *Land* (state) of Hesse, Federal Republic of Germany. It is situated on the left bank of the Main, 13 km. (8 mi.) E of Mainz and 25 km. (15½ mi.) SW of Frankfurt am Main by rail. Pop. (1961) 39,507. The town hall was built in 1604, and there is a museum. The manufacture of Opel automobiles is the chief industry. Machinery and coconut matting are also made.

RUSSIA, ORTHODOX CHURCH OF, an autocephalous church within the Orthodox Eastern Church. In the 9th century, between 860 and 867 according to Byzantine sources, the Russians were converted to Christianity and accepted a bishop from Byzantium. A Christian community existed in Kiev in the first half of the 10th century, and in 957 Olga, regent of the Russian realm, was baptized in Constantinople (but *see* OLGA, SAINT). This act was followed by the acceptance of Christianity as the state religion after the baptism of Olga's grandson Vladimir, prince of Kiev, in 988 or 989. Circumstantial evidence suggests that the Russian Church established by St. Vladimir was from the outset subordinated to the patriarchate of Constantinople (*see* CONSTANTINOPLE, ECUMENICAL PATRIARCHATE OF). Under Vladimir's successors, and until 1448, the Russian Church, headed by the metropolitans of Kiev (who after 1328 resided in Moscow), was a metropolitanate of the Byzantine patriarchate.

Under Mongol rule (1237–1480) the Russian Church enjoyed a favoured position, obtaining immunity from taxation in 1270. This period saw a remarkable growth of monasticism. The Monastery of the Caves (the Pecherskaya Lavra) in Kiev, founded in the middle of the 11th century by the Russian ascetics St. Anthony and St. Theodosius, was superseded as the foremost religious centre of medieval Russia by the Monastery of the Holy Trinity (Troitse-Sergiyeva Lavra), founded in the mid-14th century by St. Sergius (*q.v.*) of Radonezh. (*See* further MONASTICISM: *Eastern Monasticism: Slav Countries.*) Sergius, as well as the metropolitans St. Peter (1308–26) and St. Alexius (1354–78), supported the rising power of the principality of Moscow. The alliance between the church and the Muscovite state became closer still after the Council of Ferrara-Florence, when, in 1448, the Russian bishops, severing in fact though not in principle their canonical dependence on the ecumenical patriarch, elected their own primate without recourse to Constantinople. The theory, advanced in clerical circles after the fall of Constantinople in 1453, that Muscovy was the third, and last, Rome gave ideological justification to the promotion of the metropolitan of Moscow to the rank of patriarch (1589), with the approval of the see of Constantinople.

The theory of "Moscow the Third Rome" provided the background to the double conflict which in the 1650s and 1660s brought the patriarch Nikon into violent collision with the tsar Alexis, on the one hand, and, on the other, with a group of conservative clergy headed by the archpriest Avvakum. Nikon, pursuing the theocratic ideal of a Russian Orthodox empire, sought to make the church dominant over, or at least independent of, the state; Avvakum, taking his stand on a more nationalistic conception of Holy Russia, resisted the patriarch's successful attempt to bring the Russian liturgical tradition into line with contemporary Greek practice. Nikon was deposed, and Avvakum, after cruel persecution, was burned at the stake. His followers, the Old Believers, formed henceforth a vigorous body of dissenters. This, the most serious crisis in the history of the Russian Church before 1917, paved the way for its partial subjugation to the state, achieved by Peter the Great. (*See* further AVVAKUM PETROVICH; NIKON; OLD BELIEVERS.)

By the second half of the 14th century the greater part of southwestern Russia had been annexed to Lithuania. This led to the creation in 1458 of a separate West Russian Orthodox Church, whose primate, the metropolitan of Kiev, owed allegiance to Constantinople. In 1596 most of the Orthodox bishops in Lithuania—now united with Poland—submitted to the authority of the pope and, in exchange for accepting Roman Catholic doctrines, were allowed to preserve their Eastern rites. This act, the Union of Brest-Litovsk, was vigorously resisted by many Orthodox laymen, who founded brotherhoods in defense of their faith. Latin theology, however, had some influence in the West Russian Orthodox Church, especially in the theological school founded in Kiev by the metropolitan Peter Mogila (*q.v.*).

In 1721 Peter the Great suppressed the patriarchate and replaced it by the Holy Governing Synod, modeled on the state-controlled synods of the Lutheran Church in Sweden and Prussia. The chief procurator of the synod, a lay official who obtained ministerial rank in the first half of the 19th century, exercised from then until 1917 effective control over church administration. This control, facilitated by the political subservience of the majority of the higher clergy, was especially marked during the procuratorship (1880–1905) of Konstantin Petrovich Pobedonostsev (*q.v.*). Yet the Russian Church in this period was not devoid of creative vitality: the revival of contemplative monasticism was exemplified in the Optina Hermitage, whose monks devoted themselves to *starchestvo* (spiritual guidance), and in the radiant spirituality of St. Seraphim (*q.v.*) of Sarov; there was a remarkable growth of independent theological thought and scholarship; and Russian missionaries in the 19th century evangelized Siberia, the Aleutian Islands, and Alaska, and founded the Orthodox Church of Japan.

In November 1917, following the breakdown of the tsarist government, a council of the Russian Church reestablished the patriarchate and elected the metropolitan Tikhon (*q.v.*) patriarch. The administrative measures taken by the Soviet government against the church in 1917–18, which included the nationalization of all ecclesiastical lands and the separation of church and state, were followed by brutal persecution, instanced in the arrest of bishops and in the trial and execution of Veniamin, metropolitan of St. Petersburg (1922). Simultaneously, in order to undermine the patriarch's authority, the government supported the schismatic, antiepiscopal, and pro-Soviet "Living Church," which enjoyed considerable vogue in 1922–23. After publicly renouncing his former opposition to the Soviet regime, Tikhon died in 1925, having done much to restore the unity of his church and to ensure its survival in a militantly atheistic state. His work was continued by the metropolitan Sergius, who, after being arrested several times, pledged his and his church's loyalty to the government (1927). Yet the church remained under constant pressure, and antireligious propaganda continued to alternate with active persecution (the latter particularly acute in 1937–38). In September 1943, partly as a result of the support it was giving to the government in World War II, the church was granted notable concessions. Sergius was elected patriarch, and in 1944 theological instruction was permitted in several ecclesiastical establishments. After Sergius' death (1944), Alexius, metropolitan of Leningrad, was elected patriarch of Moscow and all Russia (1945). Under his leadership the Russian Church, which enjoys the active or passive support of perhaps a quarter of the population of the Soviet Union, struggles to survive in the face of antireligious propaganda and growing administrative pressure. *See* also ORTHODOX EASTERN CHURCH.

(D. Os.)

RUSSIAN ARCHITECTURE. The recorded history of Russian art and architecture may be divided into four main periods: the Byzantine, from the 10th to the beginning of the 16th

century; the National or Muscovite, from the 16th to the 18th century; the Petersburgian or European, from the 18th to the beginning of the 20th century; and the Soviet, from 1918 to the present. The centre of artistic and architectural activities shifted several times, generally following the political fortunes of the land—moving from Kiev, via Novgorod and Vladimir-Suzdal, to Moscow; from Moscow to St. Petersburg; and from St. Petersburg again to Moscow.

Materials and Style.—The vast forests, which for many centuries were the setting of Russian life, profoundly influenced the development of Russian architecture. For generations the entire utilitarian and artistic environment of the Russian peasant was fashioned of wood, and it was this constant, close contact with the forests that contributed so much to the arts of woodcraft and the great skill of the Russian carpenter. Building in wood acquired a very special place in the history of Russian architecture; its distinctive and most typical forms were closely bound up, in their origin, with the characteristic virtues and limitations of wood. Because of these limitations the old palaces of the tsars, the mansions of the boyars and the churches never attained the imposing dimensions of the castles of France or England and the Rhenish cathedrals.

In the masonry architecture of Russia, which was mostly brick, the architect utilized the lay and bond of the brick, or stucco and polychrome-tile revetments, for decorative effect. The brick patterns and the coloured tiles and faïence paneling of the 17th-century Moscow region form a bright chapter in the history of Russian architecture.

Because of the geological formation of Russia's vast plains, stone was relatively scarce and, in the architecture of pre-Petrine Russia, was used mostly for decorative purposes. It was only after the 18th century, when the rich quarries of Siberia, Finland and the Ukraine became available, that stone architecture began to flourish. Variegated marble, fine-grained granite, glistening labradorites, malachites and porphyries were used with dazzling effect in the construction and interior decoration of the great cathedrals and imperial palaces.

In the formation of its architectural style Russia was subjected to many foreign influences. The Russians borrowed much from the east and the west, but always showed discrimination in selection, proving themselves to be clever adapters and thorough assimilators. The borrowed elements were consciously and unconsciously modified and transfigured, resulting in a style distinguished by a quality of monumentality, vertical continuity, picturesqueness of mass and rich decoration. The heritage from the Greco-Roman world through Byzantium was merged with the native building tradition, and this proved itself capable of diverse expression, from naked functionalism to the fantasy of the Church of St. Basil in Moscow and the multidomed churches of Kizhi and Vytegra in the north.

THE BYZANTINE PERIOD

With the Christianization of Russia in 988, Byzantine thought and art—permeated with the proselytizing spirit of its missionaries, artists and architects—soon spread throughout the Kievan, Novgorodian and Suzdalian principalities. The emphasis of the Byzantine church on the physical splendour of its edifices was a cardinal factor in determining the characteristics of ecclesiastical architecture. Everything connected with the design and decoration of the new churches in Russia followed the Byzantine pattern; and the standard scheme of the Greek church—the cross inscribed in a rectangle, and the dome supported on piers or on pendentives—became the accepted type for Orthodox churches. The design and support of the central dome or cupola, together with the number and disposition of the subsidiary cupolas, remained for a long time the principal theme of Russian architecture. (*See* BYZANTINE ARCHITECTURE.)

Kiev.—The main monuments of Kiev were the Desiatinnaia church (989–990), the Cathedral of St. Sophia (1037) and the Church of the Assumption in the Monastery of the Caves (1073–78). All of these churches were built in the Byzantine tradition, though certain influences which came from Bulgaria, Georgia and Armenia can be discerned. The Cathedral of St. Sophia, the mother church of Russia, is the only structure of the Grand-princely period which still stands and retains, at least in the interior, something of its original form. The central part of the cathedral was in the form of a Greek cross. It had a nave and four aisles terminated in semicircular apses, and 13 cupolas (symbolizing Christ and his apostles). It was reconstructed and enlarged at the end of the 17th century when the vogue of the Ukrainian, or so-called Cossack, phase of the baroque style was at its height. It was later obscured by additional bays and stories to its lateral galleries, a new tower and many bizarre baroque cupolas. Only five apses and the central interior portion survive from the 11th century.

Novgorod and Pskov.—Novgorod was the centre of a unique and quite original Russian art that lived on long after the political death of the city; it was there that the fundamental features of Russian architecture were developed. As in Kiev, the ecclesiastical architectural history of Novgorod began with the Cathedral of St. Sophia. It was built in 1045–52, replacing a wooden 13-dome church of the same name. The new cathedral followed its Kievan namesake in plan, but the divergences from the Byzantine pattern are quite apparent; it has double aisles but only three apses. Externally the church differs even more from its southern prototype: it has only five cupolas, its walls are austere, the buttresses are flat and bare and the windows are small and narrow. There is something unmistakably Russian in the silhouette of its helmeted cupolas and in the vigour and verticality of its solid masses.

The churches of the 12th century resemble St. Sophia only in the general tendency toward simplicity and verticality; they were small, cubic in form and modest in decoration. The severe climate and heavy snowfalls of the north necessitated various modifications of the Byzantine architectural forms. In the course of time windows were narrowed and deeply splayed; roofs became steeper; and flat dome profiles assumed the bulbous form which, in different varieties, eventually became the most notable feature of Russian church architecture.

The churches of Pskov were relatively tiny and squat and usually had three low apses. The cupolas, roofs and decorative elements were similar to those of Novgorod. Because these churches were too small to contain interior columns for the support of the cupola, the Pskov builders developed the structural device of recessive rows of corbeled arches for the support of cupola drums and cupolas. This feature—the *kokoshnik*—was to become a favourite Russian structural and decorative element. The church porches, the exterior walled-in galleries and the arcaded bell towers were Pskov's other outstanding contributions to Russian architecture.

Vladimir-Suzdal.—Vladimir, as a centre of early Russian culture, was a factor in a creative fusion of Byzantine, Romanesque and Caucasian influences. The 12th- and early 13th-century structures were a further modification of the earlier Byzantine style, leading toward the innovations at Moscow in the 15th century.

Among the outstanding monuments are: the Cathedral of the Assumption (1158–89) which was to serve as a model for its namesake in the Moscow Kremlin; the Church of the Intercession on the Nerl, one of the loveliest creations of Grand-princely Russia (1165); and the Cathedral of St. Dmitri (1194–97). These churches as a group represent the continuation of the Kievo-Byzantine tradition in their ground plan, but the old scheme was given a new interpretation. From Byzantium the Suzdalians adopted the general features of the square plan with semicircular apses, and the four columns supporting a cupola with its circular drum. But instead of brick, so characteristic of Byzantine and Kievan ecclesiastical architecture, they used cut stone and instead of polychrome revetments they used carved stone embroideries. The treatment and decoration of the walls, the deeply splayed portals and windows suggest the articulation of Romanesque architecture; the character of the carved ornament is analogous to that of the Caucasus; but the organization and arrangement of the forms and patterns is definitely Russian.

THE MOSCOW PERIOD

With the fall of Constantinople (1453), Byzantine influences gradually subsided, and the hegemony in the world of Orthodoxy shifted to Muscovite Russia. Moscow, having become the new city of Constantine—the "third Rome"—and aspiring to rival the older centres of culture, launched a building program commensurate with her international importance. The Kremlin and two of its important churches were rebuilt by Italian architects between 1475 and 1510. These churches, the Cathedral of the Assumption and the Cathedral of the Archangel Michael, were largely modeled after the churches of Vladimir. The Italians were required to incorporate the basic features of Byzantine planning and design into the new cathedrals; it was only in the exterior decoration of the Archangel that they succeeded in introducing Italian decorative motifs. A third church, the modest Cathedral of the Annunciation (1484–89), with its warm beauty, was the work of Pskov architects. There the *kokoshnik* was introduced in the treatment of the roof. This element, similar in outline to the popular Russian ogee-shaped (*bochka*) roof, foreshadowed a tendency to replace the forms of the Byzantine arch by more elongated silhouettes. Ecclesiastical architecture began to lose the special features associated with the Byzantine heritage, becoming more national in character and increasingly permeated with the taste and thought of the people. The most important change in Russian church design of the 16th century was the introduction of the staged tower and tent-shaped roof developed by Russia's carpenters in her wooden age. Next was the substitution of the tent spire for the traditional Byzantine cupola. This affected the design of masonry architecture by transforming its proportions and decoration and even its structural methods. The buildings acquired a dynamic, exteriorized articulation and specifically Russian national characteristics.

The boldest departures from Byzantine architecture were the churches of the Ascension at Kolomenskoe (1532) and St. John the Baptist at Diakovo (*c.* 1532) and, above all, the Cathedral of St. Basil in Red square in Moscow (1555–60). In St. Basil the academic architectural concepts, as understood by the western world, were ignored; the structure is uniquely medieval Russian in content and form, in technique, decoration and feeling. St. Basil, like its predecessors the churches at Kolomenskoe and Diakovo, embodies the characteristic features of the wood churches of northern Russia, translated into masonry.

An effective finishing touch was given to the ensemble of the Kremlin's Cathedral square by the erection of the imposing bell tower of Ivan the Great, begun in 1505. The colossal white stone "column of fame," with its golden cupola gleaming above the Kremlin hill, was the definite expression of an era, reflecting the tastes and grandiose political ambitions of the rising Russian state.

The basic types and structural forms of the Russian multicolumned and tented churches were fully developed in the 16th century. It remained for the next century to concentrate its efforts on the refinement of those forms and on the embellishment of the façades. The tent spires degenerated into mere decoration; they were used as exterior ornamental features set loosely in numbers over gabled roofs and on top of roof vaulting (Church of the Nativity in Putinki street, 1649–52). This decorative use of the formerly functional element was combined with the liberal employment of the *kokoshnik*. The latter, in converging and ascending tiers and in diversified shapes and arrangements, was used as a decorative screen for the drumlike bases of the spires, and sometimes as parapets over the cornices. At the same time the formerly large expanses of unbroken wall surfaces (of the Novgorod-Pskov architectural traditions) were replaced by rich decorative paneling. Polychromy asserted itself: coloured and glazed tile and carved stone ornament, used in combination with brick patterns, were employed extensively. This was especially evidenced in a large group of Yaroslavl churches.

The baroque appeared on the Russian scene toward the end of the 17th century. But again the Russians imaginatively transformed its modes into a clearly expressed national style which became known as the Naryshkin baroque. A delightful example of this style is the Church of the Intercession of the Virgin at Fili (1693) on the estate of Boyarin Naryshkin, whose name had become identified with this phase of the Russian baroque. *See also* BAROQUE AND POST-BAROQUE ARCHITECTURE.

THE PETERSBURGIAN PERIOD

The founding of St. Petersburg (1703) marked the beginning of a new era in Russian art and architecture; it was at this city, later renamed Leningrad, that the spirit of western-European art broke through in a decisive manner. The heavy influx of foreign influences—Dutch, German, Italian and French—markedly affected architecture because the new capital offered a fresh field in which the wealth and adamant will of Peter the Great made it possible to obtain the best professional talent from abroad for the realization of his ambitious projects.

The western Europeans brought over the prevailing baroque art characteristics of their own countries, but the very different artistic and physical setting produced a new expression, embodying Russia's peculiar sense of form, scale, colour and choice of materials. The transformed baroque spread all over Russia and, with its vast register of variations, developed many regional idioms.

In the second half of the 18th century the baroque gave way to the rococo, and then to the rediscovered beauty of classicism, initiating a trend toward restraint and refinement. The new architectural current entered the stream of Russian art from different directions: from France, Italy and Germany. Its beginning practically coincided with the founding of the Academy of Fine Arts in 1757, and it lasted for nearly a century. It continued its existence largely through a number of foreign and foreign-trained Russian architects, who brought the classicism of the 18th century to maturity, culminating in the Russianized empire style and producing an architecture notable for its monumentality, integration of mass and space, use of colour and sculptured decoration.

The three long reigns of Peter I, Elizabeth and Catherine II denote the main successive stages of an intense architectural activity which, though principally concentrated in St. Petersburg and its vicinity, radiated from there to many parts of Russia. The impulse continued into the reign of Alexander I, especially after 1812, during the postwar years of awakened national pride. Baroque, rococo, classicism and neoclassicism all came to be represented at St. Petersburg by striking examples in close proximity to one another. Among the best are: the Cathedral of the Smolny convent (1748–64) and the Winter palace (1732), both designed in a rich Russian high-baroque style by Bartolomeo Rastrelli; the Academy of Fine Arts (1764–88) by Vallin de la Mothe and A. F. Kokorinov, a masterpiece of the so-called "Louis XV classique"; the Admiralty (1806–23), designed by Andreian Zakharov in the empire style with a strong Russian flavour; the Synod and Senate buildings (1829–34), by K. Rossi; and the new Hermitage (1840–50) by the neoclassicist Leo von Klenze.

Moscow went its own way architecturally; it yielded to St. Petersburg in range and scale of construction but outstripped St. Petersburg in picturesqueness, originality and intimacy. At a time when St. Petersburg was engaged mainly in building monumental palaces and public and government buildings, Moscow more often was building private residences and small palaces. Classicism in Moscow was less severe and more homely; the forms of the empire style was softened by giving them a freer and more colourful treatment. Outstanding examples are the old building of the Moscow university (1817–19) by D. Gilardi and the Bolshoi theatre (1821–24) by O. Beauvais.

In the 1830s classicism began to seem something foreign, or imported. Official nationalism and the growing tide of Slavophilism were instrumental in turning the Russian architect away from alien classicism toward the interrupted development of national art. Official nationalism found its expression in the projects of K. Thon, who sought to create a genuine Russian style based on old motifs derived from Russian-Byzantine architecture (the Church of Christ the Saviour, 1837, razed in the 1930s; and the Grand Kremlin palace, 1839–48). The Slavophiles' nationalism was based on the artistic activities of 16th- and 17th-century Russia and on the originality of the construction methods peculiar to that period (*e.g.*, the Historical museum in Moscow, 1875–81,

by V. Sherwood). The tendency to revive the forms of the Russian past and to rework old traditions in the spirit of a neo-Slavonic age continued for several decades. At the beginning of the 20th century the new western-European trends—the *art nouveau*, the "Vienna secession" and the "international style"—made their appearance and Russian architecture became increasingly affected by all that was extreme and modern in western architecture.

THE SOVIET PERIOD

In 1918, after a lapse of two centuries, Moscow resumed its role as the capital of Russia and once more became the political and artistic centre of the land. The Bolshevik revolution occurred at a time when the ferment of the international style and other avant-garde architectural theories was already widespread in Russia. During the early years of militant Communism (1918–22) the left school of Soviet architecture, in its desire to embody the dynamic of the revolution in plastic forms, resorted to a symbolism supposedly inherent in the geometrical or engineering forms of architecture. Afterward it was carried away, first by Constructivism, and later by Functionalism and the theories of the German Bauhaus school. The echoes of these theories showed themselves in the works of K. Melnikov, P. Golosov, A. Gintsberg, the Vesnin brothers (Leonid, Viktor and Aleksandr) and others. Experimentation with the modern idiom continued into the 1930s, but without any conspicuous success. The chief handicap of modernism was that its strangeness and cold, functional look were distasteful to those in power and incomprehensible to the masses, whose tastes had been formed by the examples of the Russianized baroque and empire styles. A return to classicism was preferred because it was felt that the dramatization of the ideals of the new life could be best expressed by a humanized architecture based on native traditions of classical forms. The official emphasis on classicism initiated a trend toward monumentalism and florid ornamentation which affected almost every type of building. In Moscow the classic expression showed a leaning toward Palladianism (especially in the works of Ivan Zholtovsky and Zinovi Rozenfeld); in Leningrad it acquired a freer, more modernized look (as in the works of E. Levinson, I. Fomin and N. Trotsky); while in Kiev, Minsk and other cities of the various republics it was tinged with local traditions. On the whole its qualities were those of an architecture in search of forms to express the idea of socialist realism—the uniqueness of the new society.

With the growth of Russian nationalist sentiment in the late 1930s came a perceptible shift toward the expression of nationalism in architecture. The emphasis on the Russian heritage was intensified at the time of the drive against cosmopolitanism in the second half of the 1940s. Extensive use was made of national forms in some of the Moscow subway stations and especially at the All-Union Agricultural exhibition at Moscow (1939–40), where the pavilions of the Uzbek, Georgian, Armenian and Ukrainian Soviet Socialist republics were among the most attractive. The originality of form and richness of ornament reflected the architectural traditions as well as the folk arts of the various republics.

After World War II.—The mania for the monumental and for lavish decoration reached its peak in the last six or seven years of the Stalin era. It was during these years that eight skyscrapers were erected in Moscow. Since they were conceived as "prestige" buildings in the ambitious program for rebuilding and beautifying the capital, their architectural requirements were formulated by government decree; their design was to be in harmony with Moscow's historically developed architecture, and therefore modernistic tendencies were to be shunned. The buildings included the new Moscow State university, two hotels, several office buildings and apartment houses. In the general scheme of their distribution each building was to be the focal point and main theme in the composition of its immediate neighbourhood, either reflecting the architectural features of the nearby historical monuments or setting the tone for the neighbourhood to be developed around it. Rising 20 to 32 stories, they were strategically located in various districts, along the principal boulevards, squares and river embankments, so that their height and bulk would bring into greater relief the beauty of the natural terrain and affect the skyline for a distance of many miles. All of them are adorned with conventional trappings and carry tall, slender, star-topped spires. Many of the decorative motifs are strongly reminiscent of those of the Kremlin.

The massive ensemble of the Moscow State university (Lev Rudnev, chief architect), located on the summit of the Lenin hills, is the largest and tallest of the Moscow giants. It overlooks the city and the great Lenin Central stadium, with its recreation fields, and is the dominating structure in the southwestern district of Moscow. The main building, whose central tower reaches a height of 32 stories, is flanked to the right and left by two 18-story wings. The colonnade to the main entrance is almost pure classic, while the connecting wings to the right and left of the main building have an English Renaissance flavour. The design of the entrance hall, staircases and principal auditoriums is reminiscent of the interiors of the Russian imperial palaces with their classical columns, rich marbles and mosaics, producing an impression of grandeur and opulence.

The university and the other skyscrapers can be seen for miles around and, although deceptive in scale, they are tremendously impressive. On close inspection their decorative details may seem Victorian to western eyes but, as elements in the city landscape, Moscow's skyscrapers have an undeniable dramatic impact.

The Transitional Period.—The end of the Stalin regime (1953) ushered in a period of limited liberalism in Russian artistic life. A number of rigidly Stalinist "socialist-realist" officials in the Union of Architects were replaced by less doctrinaire and more cosmopolitan leaders, who wanted to rid Soviet architecture of the classical clichés of the Stalin era and re-enter the contemporary European and international field. Moreover the vast demand for buildings of all types and the increasing tensions between the building industry's engineers and administrators on the one hand and the architects and theoretical aestheticians on the other, resulted in a widespread demand for a re-examination of the approach to style. In 1955 the government launched a program for revising the design of every type of building with a view to industrializing and standardizing the building industry. The problems posed by the need for economy, standardization and prefabrication both of components and complete buildings forced a thorough reformation in architectural practice.

Particular attention was given to the development of new building materials, especially synthetic plastics and light metals; to exploiting the full structural potential of reinforced, precast and prestressed concrete elements; and to exploring the decorative possibilities of the unconventional shapes that can be achieved with these malleable and expressive materials. Much research was devoted to the problem of reducing building weight and to saving steel and wood by replacing them with precision-engineered, prefabricated concrete and plastic elements.

In the light of their new experience Soviet architects began to reinterpret the principles of modern architecture, reconciling the old and the new. Evidence of the changing outlook is most noticeable in the planning of the satellite towns for both Moscow and Leningrad; in the fresh and imaginative approach to the design of the experimental residential blocks in the Moscow suburb of New Cheremushki; and particularly in the design of the U.S.S.R.'s hangarlike pavilion at the 1958 Brussels Universal and International exhibition, with its glass walls and trussed cantilevers. *See* also MODERN ARCHITECTURE: *20th Century*.

(AR. V.)

RUSSIAN ART may be divided into four historical periods: the Byzantine, from the 10th to the early 16th century; the Moscow or National, from the 16th to the 18th century; the Petersburgian or European, from the 18th to the beginning of the 20th century; and the Soviet, from 1918 to the present.

THE BYZANTINE PERIOD (988–1530)

From the 10th century until the end of the 17th century painting in Russia was virtually confined to icon painting, an art introduced to the newly converted nation in the 10th century in the form of models sent to Kievan Russia from Byzantium. This art limited itself to the reproduction of traditional representations of the deity, the saints and scriptural events without ever using the living model.

The conversion of Russia (988) took place during the Byzantine Renaissance, and therefore the two distinct sources of Byzantine art traditions—the classical and the eastern—became the basis of early ecclesiastical art in Russia. The style and manner of Byzantium, once established at Kiev, spread from there to the northern centres and their influence persisted for several centuries.

The art of the Kievan period is revealed especially in the mosaics and frescoes of the Kiev cathedrals and in the applied arts such as filigree and enamels. Of the icons of that period few are preserved. An outstanding example that has survived is the mid-11th-century Vladimirskaia Bogomater ("Our Lady of Vladimir") brought to Russia from Constantinople in the 12th century. It played an important role in the development of the Russian iconographic type of the Virgin known as Umilenie ("Our Lady of Tenderness"), depicting the Virgin and Child as an intimate group radiating the warmth of motherly love.

The Novgorod School.—The civilization of the Kievan epoch was swept away in all of central Russia by the Mongol invasion about the middle of the 13th century. But in the northern regions of Russia—in Vladimir-Suzdal and particularly in the Novgorod district—the end of the 13th century and the whole of the 14th were marked by important developments in architecture and painting.

The city of Novgorod, free from subjugation to the Asiatic hordes, became virtually the metropolis and cultural centre of Old Russia after the fall of Kiev (1240). Together with the city of Pskov and other northwestern communities it harboured many Greek artists, most of whom were monks. They were instrumental in preserving the traditions of Byzantium. But though the latter were also zealously guarded by the Russian church, the evolution of icon painting—in Novgorod, Pskov, Suzdal and other centres—was manifesting local tendencies and characteristics. The rigid Byzantine patterns, the dark colours and the austere lines gradually became graceful, bright and less solemn. As early as the second half of the 12th century Novgorod's own style, which combined the severity of Byzantium with a folkish picturesqueness, was reflected in the frescoes of the Church of St. George in Staraya Ladoga (*c.* 1180) in the Church of Nereditsa (1199). The frescoes give an idea of the tendencies in the pictorial art of that period. The draftsmanship is spirited, the brush strokes are incisive and the general effect is vivid and sparkling.

The influence of Byzantine models continued to be felt more in the icons than in the frescoes. However, in the course of the 13th century Novgorod's style of icon painting gradually strengthened and took shape: the severity of faces was softened, composition was simplified, the silhouette became bold and ever more important and the palette was lightened by bright cinnabar, snow-white, emerald-green and lemon-yellow tones.

The final brilliant stage of Byzantine art—the Palaeologus Renaissance—reached its highest point in the last quarter of the 14th century and is reflected in works at Novgorod and Moscow by the highly gifted Theophanes the Greek, a Byzantine emigrant from Constantinople, who seems to have assimilated the characteristics of the country of his adoption. His paintings, though marked by a close adherence to Byzantine standards, show the features that distinguish Russian art: notably, elongated proportions, delicacy of detail and rhythmical composition. These features can be seen in his Novgorod frescoes and especially in the central part of the *deësis* range of the iconostasis in the Cathedral of the Annunciation in the Moscow Kremlin.

Among the immediate followers and collaborators of Theophanes was Andrei Rublev (*c.* 1370–1430)—the creator of religious types with a new spiritual expression in them. He painted the frescoes of the cathedrals of the Annunciation at Moscow (1405) and of the Assumption at Vladimir (1408). But his best-known work is the icon "The Old Testament Trinity" painted (*c.* 1410) for the Trinity-Sergiev monastery near Moscow. The subject—popular in Byzantine iconography—is the visit of the three angels to Abraham and Sarah. But the severe symbolism of the old Byzantine tradition is transformed into something new, more humanistic and intimate; even more important is the novel, peculiarly Russian mood of dreamy sublimation. It is one of the great creations of medieval Russian painting.

Another inspired artist of the 15th century was Dionisi (*c.* 1440–1508). He left an outstanding monument in the frescoes of the Ferapont monastery in the Novgorod district, and there are several icons ("The Metropolitan Aleksei," "The Crucifixion" and others) attributed to him. His art is marked by the extreme elongated stylizing of his figures combined with a subtle and glowing colour scheme. He and his predecessor Rublev succeeded in expressing the essence of the Russian icon as a reflection of a spiritual otherworldliness—the icon's highest merit.

THE MOSCOW OR NATIONAL PERIOD (1530–1700)

With the fall of Constantinople (1453) the hegemony in the world of Orthodoxy had shifted to Muscovite Russia. Profound changes began to take place in Russian icon painting, leading to the birth of a national art. This evolution first became noticeable in the gradual elimination of the Hellenistic setting of the icon—landscape and architecture. Greek basilicas with their porticoes and atria were replaced by Russian churches with their cupolas, "tents" and *kokoshniki*. Russian saints and episodes from their lives furnished subjects for the Russian artists; Muscovite types and native costumes began to appear in icon painting. The palette acquired an extraordinary brilliance and the emphasis on outline was particulary stressed. Thus the Russian icon gradually became the great national art form of medieval Russia.

Close ties between the Novgorod and the early Moscow schools were maintained for a long time, since many of the great icon and fresco painters in the 16th century worked first at Novgorod and later at Moscow; thus the features characteristic of Byzantine and Novgorodian traditions appear interwoven with the Moscow trend. The literary movement of the 16th century strongly influenced contemporary painting. New subjects appeared: some illustrated the mystical interpretation of the church dogmas or expressed the rites of the church in symbolic images; others represented parables and legends.

At the end of the 16th century the Stroganov school made its appearance introducing a particular manner of icon painting in diminutive size. Its masters became famous for the elegant attitudes of their figures, the eastern flavour of their colouring and elaborate treatment of detail. Some of them—Prokopii Chirin, Nikofor and Istoma Savin—were later to join the ranks of the icon-painting studios in the Kremlin armory in Moscow.

Moscow icon painting of the 17th century forms the last chapter in the history of Russian painting prior to the Petersburgian period. At the beginning of the century the majority of the icons still retained a strong national feeling and elements of real style. But by about 1650 little remained of what had once been so distinct in the Russian icon; not only had the original style disappeared, but also the character. By the end of the century western European influences began to spread rapidly over Russia, and Russian art entered upon a new historical period.

THE PETERSBURGIAN OR EUROPEAN PERIOD (1703–1917)

The foundation of St. Petersburg (1703) by Peter the Great marked the beginning of a significant change in Russian art—the substitution of western for Byzantine influence. The trend toward westernism was incipient before Peter was born, and went on after

his death, but the turning point—when the outlook and taste of the upper classes ceased to be Muscovite and became European—took place during the reign of Peter the Great. Foreign artists and architects began to come to Russia in increasing numbers, while groups of young Russians were sent to Italy, France, Holland and England to study painting and architecture. The influx of Western influences affected all spheres of Russian cultural life and determined the character of its art for more than two centuries.

The art of Peter's age shows almost no trace of Byzantine influence. Only in iconography did the old style persist for some time. Early in the 18th century religious painting began to give way to secular painting, and the church prohibition of sculpture in the round became ineffective.

The reign of Elizabeth (1741–62) ushered in an era of aristocratic culture and art. The empress had French inclinations and a taste for luxury. In her reign a great number of vast and luxurious rococo-style palaces were built; painting was primarily devoted to their interior decoration—ceilings and walls—while sculpture was employed to adorn the gardens and parks. The work was carried on mostly by Italians and Frenchmen.

In 1757 the Academy of Fine Arts was founded in St. Petersburg, and foreign artists—mostly French—were invited to direct the new school. These trained some remarkable native portraitists such as Ivan Argunov (1727–97), A. P. Losenko (1737–73) and Fedor Rokotov (1735–1808). Their works reflected the ceremonial character of Elizabeth's tastes, but showed little evidence of native Russian sensibility.

The advent of classicism in Russia is identified with Catherine the Great (1762–96), whose cultural interests were infinitely wider and more refined than those of Elizabeth. She was not only a prolific builder but a great art collector; much of the credit for the fabulous art treasures of Russia belongs to her. The number of foreign artists that she brought to Russia or encouraged—by ordering their paintings, statues and all sorts of art objects—is truly impressive; and though she mostly favoured foreign artists and architects, principally French and Italian, Russian art profited indirectly.

Russian painters extended their range during the latter half of the 18th century, adding genres of interior decoration and landscape to that of portraiture. At the same time, however, they devoted increasing attention to portraiture. Dmitri Levitski (1735–1822) painted the aristocratic ladies and gentlemen of the court and the eminent men of letters, as well as the adolescent schoolgirls of the Smolny institute. His portraits are largely of an intimate nature, concentrating on the psychological character of the model. Vladimir Borovikovski (1757–1825) also painted aristocratic society figures and members of the imperial family. His early work is permeated by a romantic melancholy mood. Later his portraits acquired a realistic quality.

Napoleon's invasion of Russia (1812) had far-reaching consequences. It marked the revival of national consciousness and the beginning of a widespread cult of Russian separateness from Europe, thus precipitating the long controversy between "westerners" and "Slavophiles" which ran through so much of Russian 19th-century literature and thought. At the same time Russia shared the European romanticism which marked the era of the Napoleonic Wars. This is reflected in the works of Orest Kiprenski (1782–1836) and Vasili Tropinin (1776–1857). The most notable contribution to the romantic spirit was made by Karl Bryullov (1799–1852) with his monumental painting "The Last Days of Pompeii" (1833). A completely different trend appears in the work of Aleksandr Ivanov (1806–58), the first Russian painter to express religious emotions in the western manner. Other outstanding artists of that period were the painters Alexei Venetsianov (1780–1847) and Paul Fedotov (1815–52), the forerunners of realist painting in Russia, and the sculptors I. Martos (1752–1835), I. Vitali (1794–1855) and F. Tolstoi (1783–1873), representatives of Russian classicism.

The second half of the 19th century marked the coming of age of realism in Russia. A popular outlook and a sympathetic attitude toward the hard life of the people is reflected in the works of most of the painters and sculptors of that time. The new trend in art had as its basis the populist revolutionary ferment prevalent toward the end of the 1850s and the beginning of the 1860s, much of it inspired by the writers Nikolai Dobrolyubov (1836–1861) and Nikolai Chernyshevski (1828–1889). Chernyshevski's dissertation *The Aesthetic Relations of Art to Reality* (published in 1855), the main thesis of which was that art must not only reflect reality but also explain and judge it, provided a starting point for the contemporary artists.

From the last third of the 19th century onward the history of Russian art is the history of a series of school struggles: the Slavophiles against the westerners; the Academy against the Peredvizhniki ("Society of Wandering [or Traveling] Exhibitions"); and later the joint effort of the last two against a new movement, born in the 1890s and directed by the art review *Mir Iskusstva* ("The World of Art").

The Peredvizhniki society was formed in 1870 by a group of realist artists who seceded from the Academy in 1863 in protest against alien dogmatic formulas and the constricting programs of the Academy's annual competitions. Most prominent among the members of the Peredvizhniki were Ivan Kramskoy (1837–87), Ilya Repin (1844–1930), Vasili Surikov (1848–1916), Vasili Perov (1833–82) and Vasili Vereshchagin (1842–1904). The society attached far more importance to the moral and literary aspects of art than to aesthetics. Its artistic creed was realism, national feeling and social consciousness. Art was to be placed at the service of humanitarian and social ideals; it was to be brought to all the people. The society therefore organized mobile (*peredvizhnye*) exhibitions, hence the name.

The outstanding paintings by the members of this society are: "The Morning of the Execution of the Streltsy" (1881) and "Boyarynya Morozova" (1887) by Surikov; "The Volga Bargemen" (1873) and "The Arrest of the Propagandist" (1878) by Repin; "After Igor's Battle with the Polovtsi" (1880) by Victor Vasnetsov (1848–1926); "The Hermit" (1889) by Mikhail Nesterov (1862–1942); and "Still Waters" (1892) and "Golden Autumn" (1895) by Isaak Levitan (1861–1900). In sculpture the best-known works are "Ivan IV" (1870), "Peter the Great" (1872) and "Mephistopheles" (1883) by Mark Antokolski (1843–1902).

The influence of the Peredvizhniki spread throughout the country and it dominated the scene for nearly 30 years. But by the end of the century (1898), when the *Mir Iskusstva* made its appearance under the editorship of Sergei Diaghilev (1872–1929), Konstantin Somov (1869–1939) and Alexandre Benois (1870–1928), the prestige of the Peredvizhniki had greatly declined. The infatuation with problem pictures and civic themes was over.

Mir Iskusstva did not proclaim any new theories, but it attacked the low artistic standards of the Peredvizhniki, as well as the deadening influence of the Academy. Individualism and artistic personality were placed first, regardless of any school. Much of the creative work of this group tended to be based on historical themes. Such artists as Benois, Somov and Léon Bakst (1866–1924) were under the spell of the 18th century and the romantic 1830s. Others like Nikolai Roerich (1874–1947), Vasnetsov and Ivan Bilibin (1876–1942) were attempting to evoke the spirit of ancient Russia. They all aspired to achieve a synthesis of new western-European trends and certain elements of traditional Russian folk art.

The important achievements of the *Mir Iskusstva* were in the fields of the artistic book (format and illustrations) and stage designing. But perhaps the greatest contribution of this group to Russian art was the revival of the sense of tradition. It is noteworthy that nearly all that Russia exported to western Europe in the way of artistic values during the early part of the 20th century (ballet, opera, stage scenery, costume and graphic arts) was the work of this group.

In the European artistic ferment of ideas of the early 1900s Russia played a significant role. A large part of ultramodernism was born and developed there during the second decade of the century. The new ideas were taken up by the group called Bubnovyi Valet ("The Jack of Diamonds"), the work of whose members—Petr Konchalovski (1876–1956), Ilya Mashkov (1881–1944), Aleksandr Kuprin (1870–1938), Aristarkh Lentulov

(1882–1943) and others—once regarded as followers of the extreme French trends, made itself felt in Soviet Russia. This group was succeeded by several "leftist" groups, consisting of Cubists, Constructivists, Suprematists and Expressionists—all of them attempting to combine the native and foreign theories under the slogan "pure form," and most of them professing to serve the Revolution with the higher forms of abstract art.

THE SOVIET PERIOD (1918–)

The Bolshevik Revolution broke out at the time when Russia had at last caught up with western Europe in the artistic sphere. At first the Soviet regime appeared to look favourably upon avant-garde art. Extreme modernists like Wassily Kandinsky (1866–1944), Kazimir Malevich (1878–1935), Marc Chagall (1887–), Vladimir Tatlin (1885–), Naum Gabo (1890–) and El Lissitzki (1890–1941) were given official positions. But the teachings of these Abstractionist and Nonobjective artists—their professed indifference to subject matter and their hostility to popular ideas—soon proved to be their undoing, thus changing the direction of Soviet art.

The intellectuals who had any appreciation of modern art represented only a small minority of the population. Lenin himself had no sympathy for the extreme forms of modernism. He and a number of his latter-day disciples apparently sensed that the Suprematist paintings of Malevich or those of the Expressionist Kandinsky were addressed not to the common man but rather to a small coterie of connoisseurs and dilettanti, and that modernism, with its rarefied atmosphere of pure aesthetics, was incomprehensible to the masses. The hostility toward the abstract and nonobjective schools of art—accused of "capitalist cosmopolitanism"—was further intensified by the desire to establish a "people's" art answering, both in form and in content, the strivings of the new political and economic system.

To accomplish its objectives the Soviet regime adopted a program of measures aimed at the democratization and humanization of art. The extreme-left art groups (the "formalists," as they were labeled) were dissolved, and their conflicting aesthetics were replaced with the aesthetics of "socialist realism." Art was to be realistic enough to be comprehensible to the people without being merely a copy of external reality—an art socially useful and educational. This implied the exclusion of "subjectivism," "abstractionism" and all the other "antihumanistic" trends in art as practised by those who seemed not to care whether they were understood or not. The ban on formalism (a term that covered all nonobjective art) and the insistence on representational realism led to a frank revival of the "purpose" painting of the Peredvizhniki epoch, which soon developed into a lifeless academicism dominating every phase of art throughout the regime of Joseph Stalin.

The active role in the promulgation of socialist realism was played by the writer Maksim Gorki (1868–1936), whose views on aesthetics were based on the principles enunciated by Nikolai Chernyshevski; the doctrine was introduced by Gorki in a speech before the first congress of the Union of Soviet Writers held in 1934; shortly afterward it spread to all the other arts. According to Soviet art theoreticians, socialist realism permits of an infinite variety of stylistic methods, of the use of many expressive forms. The term "socialist" in the designation signifies that realism in Soviet art is based on the principles of philosophic materialism, appraising all phenomena of the past and present from the standpoint of that ideology. This view of the substance of art implied thematic painting and sculpture, but also implied that art is a part of the socialist dynamic. The artist therefore should not dwell on the negative, static characteristics of society, but must portray the positive, revolutionary-romantic side of socialist life by representing the inner world and the deeds of its outstanding workers and leaders: *i.e.*, by bringing into salient relief a deliberately magnified image of the "typical."

An outstanding part in the development of Soviet art was played by Lenin's "plan for monuments," the purpose of which was to honour the memory of the great revolutionists, the men of science, art and literature by monuments, paintings and statues. Aside from portraying Soviet leaders, the artist was urged to select his subject matter from the drama of daily life and toil of the country, stressing the theme of the "new Soviet man." As a result many statues and paintings were produced depicting scientific and industrial workers and farmers—singly or in groups, at labour or at rest—in homely realism, but often tinged with imagination. Examples of socialist realism are the sculptured stainless-steel group "Worker and Woman Collective Farmer" by Vera Mukhina (1889–1954), and the paintings "Steelworker of the Hammer and Sickle Factory" by Gavriil Gorelov (1880–), "Farm Festival" by Sergei Gerasimov (1885–1964) and "Supper of the Tractor Drivers" by Arkadi Plastov (1893–).

Another feature of this trend was the scope it gave to monumental art works in which sculptors and painters collaborated with the architect. Hundreds of artists, associated with different genres, contributed to the decoration of the new buildings—the concourses of the Moscow Subway, the halls and auditorium of Moscow university and the pavilions of the Agricultural exposition—tying in the substance of genre activities with the architecture of the structure. Some of these works are distinguished by a sense of composition, monumentalism and a sense of history; very often they display technical virtuosity and fine workmanship but they suffer from an excess of realism.

The end of the Stalin era (1953) ushered in a more liberal climate in the arts. The pressure of the tutelage system imposed from above was considerably relaxed, with the result that the artist regained a measure of freedom of expression.

RUSSIAN HISTORY. Russia (originally RUS, later ROSSIYA) was for centuries a multinational state of eastern Europe and the northern part of Asia. At first a loose confederation of principalities it became in 1480 a sovereign tsardom (Tsarotvo Russkoe) governed centrally from Moscow and in 1721 an empire (Rossiiskaya Imperiya) that was destroyed in the Revolution of 1917.

The article that follows summarizes the history of Russia from its origins to 1917. For the history from March 1917 to the end of the civil war and foreign interventions *see* RUSSIAN REVOLUTION, and for the history since that time *see* UNION OF SOVIET SOCIALIST REPUBLICS. The latter article contains sections dealing with geography, peoples, administration, social conditions, and economy.

The main divisions of this article are as follows:

I. The Origins
II. Kiev
III. Novgorod and Moscow
  1. The Tatar Domination
  2. Ivan III and Vasili III
IV. The Russian Tsardom

I. THE ORIGINS

The great east European plain which was united, together with Siberia, under the Russian tsars, presents in spite of its general uniformity two contrasting geographic aspects which profoundly influenced the trend of its historical development: the northern and the southern. A primitive forest extending over the northern part of Russia is reminiscent of that described by Tacitus in his *Germania*. It was indeed its continuation, connecting Russia with the western part of the European plain. It was comparatively late that this part of Europe was set free from its prehistoric ice cover. It is still full of lakes and great rivers which for long remained the only ways of communication for a scanty and scattered population. The primitive settlers added a few patches of cultivated land to their habitual means of livelihood—river fish, wild beehives, and fur-bearing animals in the forests.

Quite different is the southern Russian landscape. It is the steppe, the prehistoric seat of nomad hordes which inhabited it from time immemorial until quite recently. These lived on horseback and in tents and throve on the booty taken in regular incursions against northern sedentary tribes. In the steppe the most ancient traces of aborigines are found, of the Paleolithic stage, followed by the Neolithic, with traces of Aegean culture in its primitive form. There also we learn, by the intermediary of ancient Greek colonies on the northern Black Sea shore, the names of ancient peoples of southern Russia, whose nationality, however, cannot be identified. The most ancient of them, the Cimmerians (*q.v.*), are said to have been replaced by the Scyths and these by Sarmatians (*see* SCYTHIANS; SARMATIANS). Some patriotic Russian historians (I. E. Zabelin, D. I. Ilovaiski, D. Ya. Samokvasov) tried to prove that these populations were Slavs, but later research pointed to an Iranian origin; for instance, the modern representatives of Alans (a Sarmatian tribe) are found to be the Ossetes, who are not Slavs but a Caucasian people.

The original home of all Slavs (*q.v.*) is to be sought not in the steppe but in the forest. Lubor Niederle stated that the southern Slavs (Serbs), originating in the marshy land between the Vistula and Dnieper, descended to the Danube as early as the 1st century A.D. The first federation of eastern Slavonic tribes (Russians) appears in the 3rd–4th centuries A.D. as a powerful and numerous people called Antae, living between the Dnieper and Dniester. They were involved in the wars of the Goths and Huns and were defeated by the Avars (*q.v.*) in the 6th century. In the second half of the 6th century appears a new conquering nomad nationality in the steppe, the Khazars (*q.v.*), possessing a certain degree of civilization. They brought under their subjection some eastern Slavonic tribes whose names are given in the ancient Russian annals (Severyane, Radimichi, Vyatichi, Polyane). Khazar domination lasted until the beginning of the 10th century, when other nomads of Turkic descent and wilder habits—Hungarians (middle 9th century) and Pechenegs (*q.v.*; end of 9th century)—overran the steppe and broke the connection between Slavonic settlements and the Black Sea shore.

The Russian tribes must have reached a considerable development as cultivators, especially the Polyane (or people of the plain), dwelling on both sides of the middle Dnieper, the most civilized of the eastern Slavs. The Russian tribes were organized in confederations or principalities (*knyazhenia*), when, from the first half of the 9th century, came from the north a new invader—the Rus, a Varangian tribe, in ancient annals considered as related to the Swedes, Angles, and Northmen. Both Rus and Varangians are also known to Byzantine chroniclers, first as Norse pirates, then as warriors serving in the imperial guard, and finally (10th century) as chiefs of the caravans of traders coming yearly to Constantinople by the "Great Waterway" (the Austrvegr of northern sagas) through the cataracts of the Dnieper, whose names are given by the emperor Constantine VII Porphyrogenitus (905–959) both in "Russian" (Scandinavian) and in "Slavonic" (Rossisti and Sklaviusti).

Arabian writers represent the original seat of the Rus as an island covered with woods and marshes; this brings us to the source of the waterway mentioned—Lake Ilmen, near the ancient town of Novgorod, and Lake Ladoga, where the Neva River has its origin. Excavations of 9th–10th-century tumuli confirm the presence of Norse warriors, buried (or burned) with their horses and arms, in that very tableland where four chief waterways of Russia—the Neva basin, Volga, Dnieper, and Western Dvina—converge and form outlets to the Baltic, the Caspian, and the Black seas and thus determined the direction of ancient trade routes. Numerous finds of Arabian, Byzantine, and Anglo-Saxon coins (9th–11th centuries) along all these routes testify to a flourishing trade. It corresponds exactly to the period of foundation of new states by Vikings at one end of these trade routes and to the florescence of Arabian and Persian caliphates before the Mongol invasion at the other end.

II. KIEV

Russian legend says that the Rus were first asked to come to Novgorod by the local population to put an end to their internal feuds. Rurik (Hrörekr) was the first (semilegendary) *knyaz* (*koning*, prince) of Novgorod, but his companions wished to descend the Austrvegr, nearer to Byzantium, and Oleg (Helgi) settled in Kiev. The Russian annals date the arrival of Rurik in Novgorod A.D. 862. But the first reliable datum is Oleg's commercial treaty with the Byzantines, 911. A subsequent treaty was concluded in 945 by Oleg's successor, Igor (Ingvar), together with his companions, whose signatures contain 3 Slavonic names among 50 Norse.

Constantine Porphyrogenitus gave a very picturesque description of this trade, the chief business of the Rus dynasty. During winter the princes and their *gesiths*, who distributed among themselves the towns in the basin of the Dnieper, were busy making circuits among neighbouring tribes to force them to pay annual tribute. Their booty consisted of furs, money, and slaves. As spring came they loaded their small boats "made of one single tree" (*monoxulos*) and moved their caravans down the Dnieper in convoy, ready to ward off the attacks of nomad steppe tribes. In the treaties mentioned, their rights of trading in the capital were strictly defined.

The *konings* extended their power over local tribes, and to defend the land from nomad incursions they constructed earthen walls on the frontiers of the steppe. The local aristocracy joined the ranks of their *druzhina* (*gesith*, comitatus) and the process of assimilation began. The term "Rus" was now used to designate the southern outpost of the whole system of defense; *i.e.*, Kiev with the surrounding country. The son of Igor and his wife Olga (Helga) had a Slavonic name, Svyatoslav, but he remained part northern Viking as well as part southern nomad. Svyatoslav did not yet feel at home in Kiev. He wanted to come still nearer to

Byzantium and chose Pereyaslavets on the Danube in the Bulgarian land, because, he said "there was the centre where all goods gather from all parts: gold, clothes, wine, fruits from the Greeks, silver and horses from the Czechs and Hungarians, furs, wax, honey and slaves from the Rus." Svyatoslav also defeated the Khazars and the Volga Bulgars, but he was defeated by the emperor John I Tzimisces and slain by the Pechenegs on his way back home (972). With him died the Scandinavian tradition of the Kiev dynasty.

From the reign of Svyatoslav's youngest son, Vladimir, the Norman dynasty was definitely settled in Kiev. It still preserved its connections with other parts of Europe, attempted distant military expeditions against its Slav neighbours, and ruled the large territory from the northern lakes to the steppe and from the then uncertain Polish frontier to the Volga and the Caucasus. This was the most brilliant period of southern Russian history, but its brilliance rested on an unsafe base, as the connection between the newly built state and the country inhabitants remained loose. The only link unifying the subdued tribes was the power of the grand duke of Kiev. The people paid their tribute to the prince's tax collectors, but otherwise they were left almost entirely to themselves and were able to preserve their ancient tribal organization and habits.

Another element of union of enormous importance was added by the acceptance of the Christian faith in 988–989 by St. Vladimir. He took his religion from Byzantium, but the service was in the vernacular, as the prayer books and Bible had been translated into Slavonic by the apostles of the Slavs, Cyril and Methodius, in the 9th century. From 1037 the Russian church was subject to the Constantinopolitan patriarchate, and for two centuries nearly all metropolitans, and most bishops, were Greeks. Eventually, however, the Slavonic and Russian element prevailed. After Vladimir's death (1015), his son Svyatopolk the Damned assassinated his brothers (Boris and Gleb, canonized as saints) but was defeated by another brother, Yaroslav, elective prince of Novgorod, who reunited all territory under the grand principality of Kiev and embellished his capital with a cathedral in Byzantine style. He also founded the monastery at Pechersk (the Pecherskaya Laura) which became a famous seat of faith and learning; he collected books and had them translated. Under Yaroslav the earliest document of Russian law was revised under the name *Russkaya pravda* (*q.v.*; "Russian right"). He gave refuge to two sons of Edmund II of England who fled from Canute, to Olaf II of Norway, and also to Harald III Hardraade, who married his daughter. He gave another daughter to Andrew I of Hungary and a third to Henry I of France. His sons married Polish, Greek, and German wives.

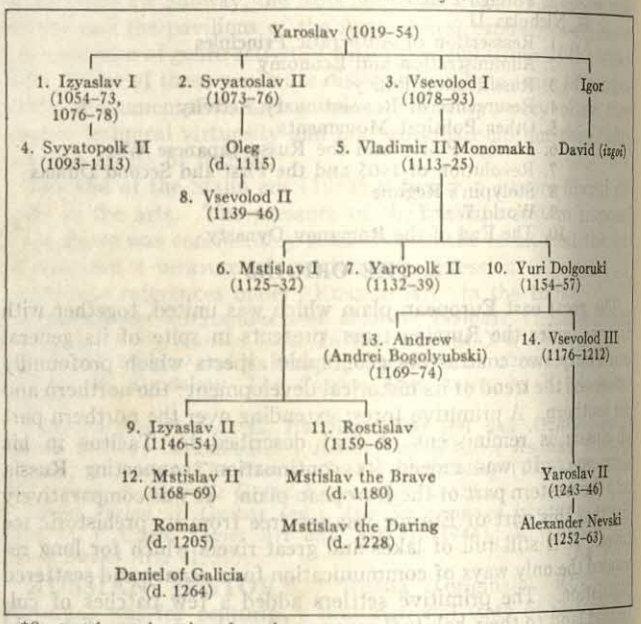
TABLE I.—*Grand Princes of Kiev**



*See text for explanation of numbers.

Yaroslav the Wise died in 1054. In order to prevent feuds among his descendants he introduced to the grand principality of Kiev an order of succession on the principle that all territory as a whole belonged to the family and that different parts of it were distributed among them in temporary possession according to seniority and to the profitableness of the seat of administration. The most profitable towns on the main trade route were Kiev, Pereyaslavl (on the steppe frontier), Novgorod (the first Norman residence), then Smolensk (on the upper Dnieper), and Chernigov (on its confluent, the Desna). All brothers of the first generation were considered as senior to the following generation. As soon as Kiev passed to another brother all the members of the family changed their seats and approached one step nearer to Kiev. If one died before reaching Kiev, his descendants were called *izgoi* and excluded from "mounting the scale." In Table I are numbered the successive reigns in Kiev during seven generations after Yaroslav.

The order of succession from brother to brother was kept only in the two first generations (1 to 5). Numbers 9 and 12 show preference given to nephews over uncles. And indeed, as early as 1097, at a conference held by the princes at Lyubech it was decided that the sons should keep their fathers' heritages. The direct succession from father to son prevailed in all principalities. Kiev was seen to be losing its former significance. Its great importance had been based on trade, but southern trade was destroyed by the appearance in the steppe (1054) of the Polovtsy (Kipchak [*q.v.*] or Kumans), nomads far more dangerous than the Pechenegs. It will also be seen that of all Yaroslav's sons

only one line survived: that of Vsevolod and his brilliant son Vladimir II Monomakh. Monomakh's line was then divided into two: the elder one (6, 9, 12) remained in Kiev and in its turn it was subdivided in two—Roman and Daniel preferred to move west from the then unsafe Kiev to Halicz (Galich; *see* GALICIA), while two Mstislavs, the Brave and the Daring, as their nicknames show, remained to the end the knights errant of the chivalrous south.

The cadet branch of Vladimir Monomakh (10, 13, 14) opened a new period of Russian history. The centre of influence changed then to northern woodland, far from the steppe. It was a far poorer but safer and, in the long run, more profitable settlement. In 1169 Andrew's troops stormed Kiev. This was the end of southern brilliance, though Kiev was not definitely destroyed till 1240 by a last and most terrible invader, the Mongol Batu, Genghis Khan's grandson.

The title of grand prince of Kiev thus lost its importance and with it broke down the unity of Russia. Princely appanages became independent principalities; Russian territory was split in a dozen separate units which waged endless wars against each other. The old Kiev centre suffered the most from these internal dissensions and from incursions from the steppe. The frontier population was nearly exterminated and mixed with Turkic ethnic elements. However, the ancient tribes remained untouched to the west and north of the Dnieper. In their midst, about the 14th century, appeared new branches of Russian people, speaking their separate languages: the Ruthenians (later known as Ukrainians) and the Belorussians (the old Krivichi).

III. NOVGOROD AND MOSCOW

Eventually three distinct centres emerged from the chaos: Halicz, Novgorod, and Moscow. Each was characterized by the prevalence of one of three main features of Russian political life during the Kiev period: (1) the popular assembly (*veche*), which represented the ancient tribal organization, which met in towns and thus consisted chiefly of townsfolk; (2) the princes; (3) the boyars (*see* BOYAR) and the *druzhina* (comitatus), a landed aristocracy, partly of ancient tribal descent, partly the military companions of the prince at the conquest. This aristocracy developed especially in Halicz, where the social structure approximated to Western feudalism. On the northwestern frontier the democratic element prevailed. The chief city, Novgorod, became a republic.

SOVFOTO

KREMLIN OF NOVGOROD; PORTIONS DATE FROM THE 11TH CENTURY, THE WALLS FROM THE 14TH

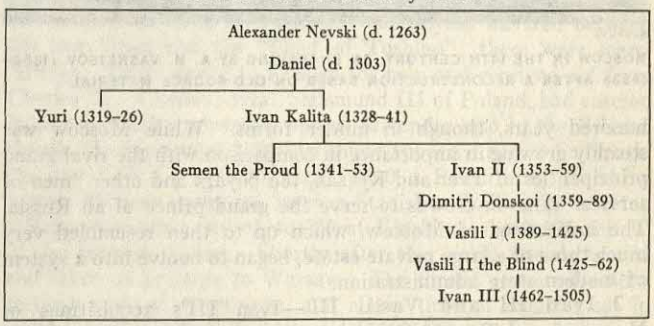
"Lord Novgorod the Great" was ruled by a popular assembly (*veche*) which elected its mayor (*posadnik*) and its commandant (*tysyatski*, chiliarch) and concluded treaties with the princes who were invited only to watch over the defense. Novgorod had a well-developed trade and large dominions extending from its gates and from the mouth of the Neva over the whole Russian north up to the White Sea and the Urals. That country was rich in furs, the chief export. The higher class of citizens was formed of capitalists and rich merchants, who were to become the aristocratic element in Novgorod (*q.v.*).

Another element existed in the political structure of central Russia: the backwoods of the Oka and Upper Volga. This country's population consisted mostly of agricultural colonists settled on princely land. Thus the prince appeared there as a proprietor and as the organizer of social life. Towns were scarce and the population scattered in clearings. The few *veches* in the chief towns had no important influence; noble landed proprietors were not so powerful as the medieval aristocracy in other European countries.

Thus, the power of the prince in central Russia was practically unlimited. Princely psychology was framed accordingly; unlike the valiant knights of the south, they formed a dynasty of great appropriators, stingy and acquisitive, ruling their principalities as private estates. They thus accumulated elements of strength which as time went on aided them in becoming masters of the whole of Russia.

After the conquest of Kiev by Andrew (Andrei Bogolyubski) the title of grand prince passed from Kiev to a northern town,

TABLE II.—*Grand Princes of Moscow*



Suzdal, and from there to Vladimir on the Klyazma. But as early as 1147 Moscow is mentioned in the annals. Its situation was exactly at the centre of Russia, between the Oka and the Upper Volga. It had long been a great centre of continental river trade, far from the southern area of Tatar devastation. The line of grand princes of Moscow starts from Alexander Nevski's younger son Daniel. Their genealogy during the domination of the Golden Horde (1240–1480) is shown in Table II.

1. The Tatar Domination.—All these princes had to ingratiate themselves with the khans of the Golden Horde (*q.v.*) to receive from them the *yarlyk* (investiture) as grand dukes. They regularly journeyed to the capital of the khans and underwent every kind of humiliation. But they returned as chief collectors of the Tatar tribute, which gave them power over neighbouring principalities. Only the principality of Tver competed with them very stubbornly.

The princes themselves involved the Tatars in their feuds and brought punitive expeditions on Russia. The khan's protection gave the Muscovite grand princes the upper hand over their enemies. They soon succeeded in increasing their possessions. Ivan I extended his domain, by purchase and by violence, over the whole province of Moscow. Dimitri (Donskoi) added to it the upper Volga region (excepting Tver and Yaroslavl), Tula, and Kasimov; Vasili I acquired the remaining part of Oka and Suzdal, Vladimir, Murom, and Nizhni-Novgorod; and Vasili II added Elets in the south and Vologda and Ustyug in the north. A religious sanction was given to Muscovite unionist tendencies by the metropolitans of the Russian church, who in the persons of Peter, Theognost, and Alexius settled in Moscow. Accordingly, the grand princes of Moscow added to their title: "of all Russia." Dimitri won a great name by his brilliant victory over the Tatars of the Golden Horde led by Mamai in a bloody battle on Kulikovo Plain (1380). He thus appeared as a leader of all the national forces (excepting the grand prince of Ryazan) against the oppressors, and he received the blessings of the church at the hand of St. Sergius (*q.v.*) of Radonezh, prior of the convent of the Holy Trinity.

Two years later, however, Moscow was sacked and burned by another conqueror, Tokhtamish, who in turn was defeated by Timur, his former protector. The Tatar yoke lasted for another

SOVFOTO

MOSCOW IN THE 14TH CENTURY, AN ENGRAVING BY A. M. VASNETSOV (1856–1933) AFTER A RECONSTRUCTION BASED ON OLD SOURCE MATERIAL

hundred years, though in milder forms. While Moscow was steadily growing in importance in comparison with the rival grand principalities of Tver and Ryazan, the boyars and other "men of service" came in crowds to serve the grand prince of all Russia. The institutions of Moscow, which up to then resembled very much those of a large private estate, began to evolve into a system of modern state administration.

2. Ivan III and Vasili III.—Ivan III's acquisitions of Novgorod and Tver (1478 and 1485) enlarged Russian territory up to the limits of settlement of the Great Russian branch of the nation and brought Russia into direct contact with other countries, Livonia, Lithuania, and the Tatar khanate of Crimea. The title of "sovereign of all Russia" became a reality, and systematic foreign relations were started. The all-Russian potentate proffered historical claims against Lithuania, which possessed the Belorussian territory. The successful wars which followed extended the western frontier to Chernigov and Novgorod Seversk, while leaving further claims for Smolensk, Kiev, "and all Russian patrimony" to Ivan's successors. Ivan also built the fortress Ivangorod close to the Gulf of Finland, thus opening the chapter of Russian pretensions on the Baltic. The Crimean khan Mengli Girei accepted his friendship and helped him to put an end to the Golden Horde. As early as 1480 Ivan refused the Tatar tribute and threw off the yoke.

The title of grand prince seemed inadequate after all these successes; more pretentious claims were based on a new theory suggested by southern Slav and Greek divines. According to this theory the Muscovite prince was a successor of the Byzantine emperors and the only representative of the Orthodox Church in the world. Indeed, the Greek Orthodox Church had accepted the "union" with the Catholics as early as 1439, at the Council of Ferrara-Florence, and Constantinople, "the second Rome," had been taken by the Turks in 1453. Obviously, the Greeks had been punished by God for their apostasy, and their succession had to pass to the third Rome, which was Moscow, and to the Russian grand prince, who remained the only faithful and really Christian prince in the world.

The realization of this new scheme began with the marriage (Nov. 12, 1472) of Ivan III with Zoë (in Russia, Sophia), the only niece of the last Byzantine emperor, Constantine Palaeologus. With her arrival new habits appeared at the Muscovite court intended to magnify the new autocrat (a title used by Ivan in foreign relations). The church that gave its sanction to that change claimed a reward: the prince had to help it against all heresies and internal dissensions. The prior of Volokolamsk convent, Joseph (*q.v.*), insisted on burning some rationalistic heretics in Novgorod. He also defended the principle that wealth gives power to the church, and he mercilessly crushed tendencies of the reformer Nil Sorski, the "abstainer from property," who opposed the persecution of heretics. Thus, the official theory on Russian church and state was formed as early as the end of the 15th century. Under Vasili III the unification of Russian territory was consummated by the acquisition of another republic, Pskov (1510); by the final annexation of Ryazan, the last independent grand principality; and by a new extension at the expense of Lithuania—the acquisition of the frontier city of Smolensk (1514). The minority of Vasili's son Ivan, who was three years old when his father died (1533), and subsequent disputes over the regency between rival factions, lasting 14 years, did not interrupt the growth of the Muscovite state. The reign of Ivan the Terrible marks the beginning of another period of Russian history. (P. M.; S. G. Pu.)

IV. THE RUSSIAN TSARDOM

A. From Ivan IV to the First Romanovs

1. Ivan IV the Terrible.—The reign (1547–84) of Ivan IV was an epoch of important development for Russia. Ivan's grandfather and father, during their rule as grand princes, had united politically all the Great Russian territories. During Ivan's reign (he was 16 when he began to rule) Russia became a vast, integrated state. Though its people were of various ethnic origins, its administrative system was centralized. Its aims in both external and internal policy were clearly defined, the tsar wielded great power, and the position and privileges of the hierarchy were sharply defined. From 1542 the metropolitan of Moscow, Makari, head of the Russian Orthodox Church and a highly educated and intelligent man, greatly influenced the young ruler, who adopted the metropolitan's ideas of the sovereign's divine right. In 1547 Ivan was crowned as first tsar (shortened from Latin *Caesar*) of Russia, and in 1549 the first *zemski sobor* (*q.v.*; "assembly of the country") was summoned. Reforms undertaken by Ivan's government during the 1550s were designed to strengthen the state, to give its subjects a better chance of justice both from the courts and the administration, and to give urban and rural dwellers some degree of local autonomy.

In the late 1540s Ivan waged a series of wars against Russia's old enemies, the Tatar khans. Kazan fell in 1552 and Astrakhan in 1556, providing Russia with an exit to the Caspian Sea but bringing a new danger, since Russia's sphere of interest now

clashed with that of the Ottoman Empire. Against the advice of his intimates, his so-called "Chosen Council," Ivan decided that Russia needed an exit to the Baltic as well. The so-called Livonian War of 1558–83 ended, after several resounding victories, in defeat for Russia, greatly undermining the state's economy. Russia's only other successful expansion was in the east, where Ermak Timofeevich entered western Siberia in the 1580s.

JOHN R. FREEMAN & CO.

IVAN IV, DETAIL FROM A CONTEMPORARY ITALIAN WOODCUT

The internal life of the country was complicated by the fierce political struggle directed by the tsar against the princely houses and aristocracy. In 1565 Ivan divided the realm into two; his private (*oprichnina*) appanage land, which he administered personally; and the remainder (*zemschina*), which continued to be ruled in the traditional way by the council of boyars. This arbitrary division resulted in almost complete disruption of the national economy. Ivan broke the strength of the old aristocracy and that of the church. He enhanced the status of the new class of state servants, landowners who held their estates direct from the crown. In an effort to attain his military objectives he reorganized the army; formed the first regular body of troops, the fusiliers (*streltsy*); created the Russian siege train; and built several fortresses. He also ordered the compilation of the first register of taxable land, to effect a more proportionate system of taxation. He was a patron of the arts, and the first Russian printed books date from his reign.

Ivan's aims were beyond Russia's understanding. Dissatisfaction with his rule rose to such a pitch that many Russians emigrated to the borderlands, where the central government's authority was less evident. The tsar's power became absolute. Ivan said that "he was free to pardon or put to death any of his subjects at will" and illustrated the precept frequently and brutally, as in his savage destruction (1570) of the city of Novgorod and its inhabitants when they became suspect of separatist tendencies. Ivan steadfastly held to his theories of Byzantine caesaropapism, but nevertheless was one of the first Russians to work for contact with the West and in particular with England.

2. Fedor I.—The son and heir of Ivan IV, Fedor, was a weak man whom Ivan called more fit to be a bell ringer in a convent than a tsar. The *zemski sobor* confirmed his accession, but the direction of affairs fell to his brother-in-law Boris Godunov, an able man who continued Ivan's policy. The Church of Russia, already autocephalous, received its independence and equality with other Orthodox churches by the granting to its head, the metropolitan Job (Yov), of the title of patriarch at the hands of Jeremiah, patriarch of Constantinople (1589). Another important measure was intended to strengthen economically the landed gentry class created by Ivan IV as against the boyars. Peasants were forbidden temporarily to leave their estates or migrate to other landowners. All such fugitives who fled from their masters after 1592 (the time of the completion of government registers) were ordered back in 1597. The successful war with Sweden (1590–95) resulted in the return of the Russian towns of Ivangorod and Koporie, ceded by Ivan IV.

3. Boris Godunov and Vasili Shuiski.—In 1598 Fedor died; after some hesitation Boris had himself elected tsar by a *zemski sobor*. His policies remained more or less unchanged, but the stability of the realm was gravely affected by a severe famine and an outburst of plague (1601–03). Boris pursued Ivan IV's policy of weakening the boyars, but he met with opposition on their part. The only legal heir of Fedor, Dimitri, had died in Uglich, the place of his exile, in May 1591. But the boyars, with the help of the Poles, opposed to Boris a "Pseudo-Dimitri," a young and well-educated man of obscure origin. Boris died (April 1605) soon after the appearance of this pretender, who was accompanied by Polish volunteers and aided by the Cossacks. On June 30 (new style; June 20, old style), 1605, the impostor entered Moscow.[1]

On May 27 (N.S.), 1606, Pseudo-Dimitri I was killed in an outbreak caused by the boyars, led by Vasili Shuiski, who took advantage of the popular dislike of the pretender's free habits of life and the Catholic tendencies of his Polish protectors. The old dynasty was completely extinguished, and the throne of the tsar passed to Shuiski (1606–10). He gave a formal promise to the boyars not to rule without their advice and not to exterminate them by capital punishment or by exile and the confiscation of estates, without resorting to their court.

The power of the boyars, however, could not be restored; much more influential now was the rising class of small landlords. Still more dangerous for Vasili were the Cossacks and the fugitive serfs in the newly colonized south of Russia. A real social uprising was started in the south by a former serf, Ivan Ivanovich Bolotnikov. Trouble was rife in the south and the east. A second Pseudo-Dimitri appeared and in the spring of 1608 marched on Moscow, establishing his camp at Tushino. The boyars wavered between the tsar Vasili and the "Thief of Tushino"; there were many flittings. Vasili turned to Sweden for help and received aid from Charles IX. Charles's rival, Sigismund III of Poland, had entered Russia as Vasili's adversary and as pretender also to the Russian throne. In September 1609 Sigismund appeared before Smolensk. On July 3 (N.S.; June 23, O.S.), 1610, a Polish army marching toward Moscow under the hetman Stanislaw Zolkiewski defeated a Russo-Swedish army of 46,000 at Klushino, about 120 mi. W of the Russian capital. Shortly after this Vasili was dethroned and taken as prisoner to Warsaw. The throne remained empty through internal dissensions, and a real time of troubles set in which lasted for three more years (1610–13).

4. The "Time of Troubles."—The boyars preferred a Polish candidate, and together with the landed gentry they offered the Muscovite throne to Sigismund's son Wladyslaw. A delegation was sent to Smolensk, and Moscow voluntarily received Polish troops on Sept. 30 (N.S.; 20, O.S.), 1610. A treaty was concluded with Wladyslaw which secured the rights of the council of boyars and the privileges of the landed gentry. A Polish dynasty might have settled in Moscow but for Sigismund's desire to keep the throne for himself. His pretension awakened the spirit of national opposition. Pseudo-Dimitri II at once won popularity, especially among the Cossacks and the lower classes, but in December 1610 he was killed by a Tatar of his suite. The landed gentry then took action on the urging of the patriarch Hermogen. The landed gentry under Prokopi Petrovich Lyapunov and the Cossacks under Prince Dimitri Timofeevich Trubetskoi and the ataman Ivan Martynovich Zarutski blockaded Moscow; inside the town a popular uprising forced the Poles to retreat to the Kremlin. But again dissensions arose among the besiegers. Lyapunov was killed by the Cossacks, and the landed gentry returned to their homes. The south of Russia was in complete disorder; crowds of Cossacks and Polish marauders dispersed all over the north. This finally decided the gentry to make a new effort and to gather a new national army which would "exclude the Cossacks and stand firm until a new sovereign is elected by all the land." Prince Dimitri Mikhailovich Pozharski was made commander in chief of the army and Kuzma Minin, a butcher from Nizhni-Novgorod, the treasurer. All northern towns and districts sent their detachments and their representatives to the army as it advanced up the Volga. In April 1612 it stopped at Yaroslavl. As Novgorod had been taken by the Swedes, Pozharski offered the throne to Charles Philip, brother of Gustavus II (Adolphus). In August Pozharski's army moved southward to Moscow. On Dec. 7 (N.S.; Nov. 27, O.S.) the Poles capitulated in the Kremlin, and a national candidate was set free: the young Michael Romanov, whose father, the metropolitan Philaret (Fedor Nikitich Romanov), a nephew of

[1]After 1582 the Gregorian calendar came into general use in Europe, but it was not adopted in Russia until 1918. Consequently from 1582 to 1699 dates of the month in Russia were 10 days earlier; from 1700 to 1799, 11 days earlier; from 1800 to 1899, 12 days earlier; and from 1900 to Feb. 1, 1918, 13 days earlier. In this article new style dates peculiar to Russia are given first; the old style dates are given in parentheses.

the first wife of Ivan IV, was at that moment a prisoner in Poland. All votes were at the disposal of a national tsar, more acceptable to the gentry as he did not belong to an old princely family and was young enough (he was 17) to secure the boyars against overbearing conduct. Michael was unanimously elected by a regular *zemski sobor* on March 3 (N.S.; Feb. 21, O.S.), 1613.

(P. M.; N. An.)

B. The Romanov Dynasty

The reign of the first three Romanovs (*see* Romanov) appears in retrospect to have been a period of transition between two periods of crisis: the crisis attending and following the efforts of Ivan IV to establish in Russia an absolute monarchy on the one hand, and that connected with the reforms of Peter I on the other. It was characterized by a deliberate conservative policy, a desire of those in power to stabilize the state and society and to revert to the practices that had prevailed under the previous dynasty. But powerful forces countered this effort: in varying degrees, pressures pushing toward something radically new affected the country's political system, its social structure, its foreign policy, and its cultural and religious life. In the end the reign of the first Romanovs proved more reformist than its rulers had intended. In many ways, therefore, this period marks a watershed between medieval and early modern Russia.

1. Internal Political and Social Affairs.—Conservative practices survived best in the realm of politics. The constitutional system evolved in Moscow in the preceding two centuries remained intact. The absolute tsar, advised by the boyar council (*duma*) and, on important occasions (before 1653, when they were suspended), by land assemblies (*zemskie sobory*), ruled the country through an administrative apparatus centred in bureaus known as *prikazy*. Local government was in the hands of military governors (*voevody*). Only in the armed forces, which in some ways constituted the main concern of government, could significant innovations be discerned. The traditional levy gradually gave way to a standing, professional army (some of it hired abroad), maintained by the tsar's treasury. Its growth tended to undermine Russia's social and fiscal structure and to pave the way for Peter's reforms.

Russia's social classes, during this period, were fully harnessed in the service of the state in accord with the principle of the "servitor state" evolved early in Moscow history and finally rationalized by Peter the Great. Duties, not rights, determined the status of the tsar's subjects. The landowning class had to serve in the military or civil service; the city population (legally tied to its place of residence) had to collect state taxes and was allowed to trade and to manufacture; the clergy and monks had their defined sphere of obligations; and the peasantry (almost all of which was formally tied to the land now) had to provide the other classes and the crown with the means of subsistence. Serfdom, as a legal institution, came into existence in this period. All these obligations were formally promulgated in the code (*ulozhenie*) of 1649. This period also marks the gradual decline of the ancient aristocracy, symbolized by the abolition in 1682 of *mestnichestvo*, that peculiarly Russian system of reconciling social status with office (*see* Boyar); the gentry, on the other hand, continued to grow in power and in numbers.

2. Foreign Policy.—As far as foreign policy is concerned, the reign of the first Romanovs may be divided into two parts. In the first, extending to the early 1650s, Russia was on the defensive. Emerging from the "time of troubles," it was mainly concerned to secure recognition of the new dynasty and to gain time to rebuild. These aims were achieved by the signing of peace treaties with the country's two principal enemies, Poland (1619 and 1634) and Sweden (1617). Both required from Russia considerable territorial concessions. Commercial and industrial privileges granted to English and Dutch entrepreneurs brought the treasury badly needed subsidies and, incidentally, laid the foundations of Russian industry. After 1650, encouraged by the sudden collapse of Poland, Russia went on the offensive, from which it obtained first the areas inhabited by the Dnieper Cossacks (treaty of Pereyaslavl, 1654), and then Kiev, Smolensk, and all the lands on the eastern bank of the Dnieper (treaty of Andrusovo, 1667). Russia now began in earnest to expand toward the Black and Baltic seas, a movement which became a constant feature of its history in the subsequent century.

3. Culture.—The profoundest changes affected Russia's cultural life. These were in large measure due to increased contact with the West brought about partly by measures sponsored by the government (influx of foreign soldiers, businessmen, artisans, and diplomats) and partly by a powerful stimulus received from the newly acquired Ukraine. By the 1660s the foreign colony in Moscow numbered over 1,000 persons, and, in addition, there were many other Westerners, mostly Protestants, engaged in trade and manufacture in the provinces, as well as serving in the army. In this period there emerged, especially in the ranks of the aristocracy, a thin layer consisting of westernized Russians who had lost much of the confidence in the superiority of Russian ways that had characterized the old elite (*e.g.*, I. A. Khvorostinin, G. K. Kotoshikhin, F. M. Rtishchev, A. L. Ordyn-Nashchokin, V. V. Golitsyn). The church, too, was subject to foreign influences emanating largely from the Ukraine and Greece. Beginning with the reign of Michael, the church authorities made efforts to rid Russian rituals and service books of accumulated errors, by carefully collating them with their Greek models—efforts which at once ran into opposition from much of the clergy and the mass of believers. Under Alexis this reform movement, given a powerful stimulus by the patriarch Nikon (*q.v.*) and backed by the tsar, engendered a dramatic crisis in the church, as a result of which it split in two: the state-supported (reformed) Orthodox Church, and the schismatic body of Old Believers (*see* also Avvakum Petrovich; Old Believers). What the church gained thereby in orthodoxy it lost in vigour and following, and it could offer no resistance when Peter I imposed on it direct bureaucratic rule.

4. Character of the Monarchy.—The early Romanovs were weak monarchs. Michael Fedorovich (1613–45), crowned at the age of 17, shared the throne during the crucial years of his reign with his father, the patriarch Philaret. Alexis Mikhailovich (1645–76) came to the throne at the age of 16; he was much under the influence first of B. I. Morozov and then of the patriarch Nikon. Fedor III Alekseevich (1676–82), a boy of 15 at the time of his accession, also yielded much power to favourites. On the other hand, all three were popular tsars, who left behind a good memory among the people and whom the Slavophils of the 19th century idealized as model Russian monarchs. Government during this period usually rested in the hands of individuals who for one reason or another exercised personal influence over the tsars, and of powerful boyar clans (often directly related to the ruling dynasty) which held in their hands the reins of administration in the council, *prikazy*, and office of the *voevoda*. Popular dissatisfaction usually turned against them, *e.g.*, during the urban uprisings (1648–50) of the reign of Alexis, and the great peasant rebellion led by Stenka Razin (*q.v.*).

In theory, the Russian monarchy was unlimited, and indeed there were no guarantees, either legal or economic, against the arbitrary power of the tsar. In practice, however, the degree of control he could exercise over the empire was effectively limited by the size of the country, the inadequacy of the administration, and a generally nonmodern conception of politics. As a consequence, the vast majority of the inhabitants rarely felt the heavy hand of the state, whose authority limited itself to the maintenance of order and the collection of taxes; some (*e.g.*, the Siberian inhabitants and the Cossacks) lived in completely autonomous communities, only nominally under the authority of the tsar.

(R. E. Pi.)

V. THE RUSSIAN EMPIRE

A. Peter I the Great

The years 1682 to 1725 cover the troubled but important regency of Sophia Alekseevna (until 1689), the joint reign of Ivan V and Peter I, and the three decades of the effective rule of Peter I (*q.v.*). In the latter period Muscovy, already established in Siberia, enters the European scene and in 1721 becomes the Russian Empire with a multinational population of about 17,500,000. Out of the 13,500,000 Russians, 5,500,000 men were liable to

PETER THE GREAT

Peter I, shown at left in 1698, traveled widely in Europe. As tsar he strove to bring European efficiency and culture to Russia. His devotion to Western culture is revealed in the design of St. Petersburg, shown above in 1725, which he founded. Repressive measures during his last years made him unpopular in some circles, as shown by the cartoon at right, "The Mice Bury the Dead Cat," satirizing his funeral in 1725

(LEFT) PAINTING BY SIR GODFREY KNELLER; REPRODUCED BY GRACIOUS PERMISSION OF HER MAJESTY QUEEN ELIZABETH II; (TOP RIGHT) ENGRAVING BY MARCELIUS IN THE STATE HISTORICAL MUSEUM, MOSCOW, SOVFOTO; (BOTTOM RIGHT) RADIO TIMES HULTON PICTURE LIBRARY

the poll tax, 3% of them being townsmen and 97% peasants. Of the peasants, 25% cultivated church lands, 19% state lands, and the remainder the estates belonging to some 100,000 families of secular landowners. Russia's territory of about 4,633,200 sq.mi. (12,000,000 sq.km.) included some recent and valuable acquisitions. By its victory over Sweden in the Northern War (*q.v.*), it regained Ingria and Finnish Karelia and acquired Estonia and Livonia, with the ports of Narva, Revel (Tallinn), and Riga. The price of success on the Baltic was failure on the Black Sea: the regions of Azov and Taganrog won from Turkey in 1696 had to be surrendered in 1711. Both parts of the adjacent area of Zaporozhye (the dominion over the left bank of the Dnieper and the protectorate over the right bank) were likewise lost to Turkey, but the *sich*, the Cossack stronghold, was razed to the ground in 1709. On the Caspian, after defeating Persia in 1722, Russia temporarily occupied Dagestan, Gilan, and Mazanderan. In eastern Siberia, in the 1720s, it annexed the Chukchi territory and the Kamchatka Peninsula. St. Petersburg, founded in 1703 among marsh and woodland, a living symbol of the new era and of its initiator, replaced Moscow as the capital of Russia in 1712. There the sea routes of the Baltic met the system of overland waterways leading to the Caspian.

1. Economy.—The peasants, in addition to bearing virtually the full weight of the fiscal burden throughout Peter's reign, were compelled to supply the state with military and civil conscripts: recruits for the army and navy; and labour for the construction of fortresses, canals, ships, and St. Petersburg. Peter's prohibition of 1723 "to sell peasants like cattle" illustrates their plight. The diminishing freedom of the rural population hindered industrial development. In addition to the lack of a free labour market, capital was in short supply and potential entrepreneurs were hard to find among the townspeople, of whom, toward the end of the period, there were only about 170,000, a bare 10% more than in 1700. The merchants proved to be the most enterprising members of this class. Anxious to stimulate industry (as well as trade), the government took a hand in the establishment of factories but also encouraged private enterprise, especially by making up the deficiency of capital and labour. Thus state serfs were assigned to factories, and non-*dvoryane* received permission to acquire manpower through the purchase of villages. Of the 199 factories existing in 1725, 18% were textile and 31% metallurgical, and all but 13 had been established in the reign of Peter, half of them by the state. Most of the factories were located in the new industrial region of St. Petersburg, northeast of the new capital on the Svir, round Moscow and Tula, on the upper Don, and round Ekaterinburg (now Sverdlovsk) in the Urals. The factories eventually armed Peter's army and navy and nearly clothed his soldiers, thus fulfilling the purpose for which they had been created. Moreover, in 1726 Russia began to export pig iron.

2. Military, Finance, and Administration.—By 1710 Russia had a regular army recruited by conscription from among the peasantry and petty townsfolk, the first of its kind in Europe. In 1724 its effectives numbered 131,400 infantry and 38,400 cavalry, excellently trained and equipped. The Black Sea fleet had to be given up, together with Azov, in 1711. The Caspian flotilla was used against Persia in 1722. The Baltic fleet, built mostly in Russia after 1700, consisted in 1711 of 11 and in 1724 of 44 ships of the line and frigates armed with over 200 guns and manned by an establishment of about 16,000.

The cost of the army, 4,000,000 rubles annually, was the chief item in Russia's budget. After 1718, when the poll tax was first introduced, the deficit was gradually reduced until in 1724 a surplus was obtained.

Financial and administrative reform went hand in hand. The colleges (*kollegii*)—central administrative departments—established between 1718 and 1722 were severally concerned with war, the navy, foreign affairs, foreign trade, state revenue, state expenditure, audit, justice, mines, factories, spiritual affairs, the estates of the gentry, and "Little Russian" (Ukrainian) affairs. Fifty provinces (*provintsii*), each under a *voevoda*,

RUSSIAN TERRITORIAL ACQUISITIONS IN EUROPE AND SOUTHWESTERN ASIA BEFORE 1914

were subordinated in part to the colleges and in part to the senate. Established in 1711, when it replaced the council of ministers which had evolved from the boyar *duma,* the senate became a superior authority whose task it was to control and coordinate all the organs of government, including the secret police. The senate in turn was supervised by a procurator, Russia's all-powerful chief bureaucrat, from 1722 responsible to the tsar only.

3. Church and Education.—The church was subordinated to the state through the Holy Governing Synod, a ministry of ecclesiastical affairs under the direction of a lay chief procurator. The church, in 1722 the landlord of about 1,000,000 peasant families, was nationalized also in the economic sense: the income from its lands was handed on to the state. Thus the policy of control and financial exploitation applied to the church since 1696 became a fundamental law. The church was also called upon to establish diocesan schools for the sons of clergy, in addition to maintaining the two ecclesiastical academies already in existence in Moscow and Kiev.

Lay education owed its expansion to naval and military needs. In 1701 a navigation school was established, the first of four, and in 1715 a naval academy for 300 pupils to provide in Russia the training for which hundreds of young *dvoryane* previously had been sent abroad. Knowledge of the three R's was compulsory for sons of the gentry, for whom the provincial "cipher" or elementary schools established in 1714 were primarily intended. The engineering school prepared pupils for the so-called Engineering Company created in 1719. The Moscow teaching hospital was established in 1707 and a secular academy was decreed in 1724.

4. Relations with the West.—To start the new schools and government departments, to build ships and organize workshops and train armies, foreigners were invited to Russia and Russians were sent abroad. Traffic and trade with the West increased. By 1726, via Petersburg and Archangel, Russia imported 1,500,000 rubles worth of wine, sugar, silk and woolen goods, and dyestuffs, and exported hemp, flax, sailcloth, linen, leather, tallow, and pig iron to the value of over 2,500,000 rubles. In 1724 a high protective tariff was imposed on all imports, to be levied in foreign currency. Russia's commercial relations with Holland and England were particularly close, but British exports suffered from the break in diplomatic relations between 1719 and 1730. In a number of Western ports Russia's trade interests were guarded by consuls; its Eastern trading partners were Persia and China. With permanent envoys in most European capitals, Russia was able to treat war and diplomacy as a combined operation. By 1725, having defeated and made an ally of Sweden, it had obtained supremacy in the Baltic. Its struggle with Turkey for access to the Black Sea was drawn, but the humiliating Tatar tribute had been tacitly repudiated. United by a dynastic bond to Holstein, Russia shared with Prussia a policy of keeping Poland weak; it also was drawing closer to Austria.

5. Internal Disturbances.—The new Russia, secular and westward-looking, grounded on a standing army and a tax-gathering bureaucracy, also had its internal enemies. In 1705–06 the populace of Astrakhan (one of the principal trading centres with the Middle East) overthrew the government of the province (*see* GOLITSYN, BORIS ALEKSEEVICH). In 1707–08, on the Don, runaway serfs, deserters, and conscript labourers under Kondrati Bulavin, a Cossack ataman, were up in arms against the boyars and chiefs, foreigners and tax collectors, and the official church. Be-

tween 1704–06 and 1720–25 hungry peasants rioted against conscription and taxation. But the secret police and punitive expeditions stamped out all opposition to Peter's government.

(L. R. Lr.)

B. From Catherine I to Paul I

1. Peter's Immediate Successors.—Peter met with opposition in his own family; his son Alexis (*q.v.*) grew up under the influence of the clergy and obviously disapproved of Peter's reform. He fled abroad from Peter's menaces, was brought back by fraud, imprisoned on suspicion of a conspiracy against his father's life, and died by torture. There remained only two daughters, Anna and Elizabeth, from the second marriage of Peter with a Lithuanian maidservant, Marfa Skavronskaya, renamed Ekaterina (Catherine) Alekseevna. In 1722 Peter reserved for the monarch the right to designate his successor. But at his death on Feb. 8 (N.S.; Jan. 28, O.S.), 1725, he failed to do so. Peter's creatures, like Aleksandr Danilovich Menshikov (*q.v.*), who had everything to fear from the survivors of old nobility, resorted to the guards and with their help proclaimed Catherine as empress. The legitimate heir, the son of Alexis, Peter, was thus put aside. The Russian throne, as Voltaire said, became "not hereditary and not elective, but *occupative*." The period from Peter's death to Catherine II's accession (1725–62) was an eclipse. Male members of the Romanov dynasty (that is to say, Peter's grandsons Peter II and Peter III, the sons of his son Alexis and of his daughter Anna of Holstein-Gottorp, respectively) were frail and feeble of mind. The women —both Peter's niece Anna (Ivan V's daughter) and his daughter Elizabeth—were stronger in mind and body. But they shared their power with favourites, and their choices were not always happy.

Court life flourished under these women's reigns, and it became very luxurious and expensive. A special school was founded by Empress Anna to teach the noble guards foreign languages, dances, and good manners. Balls, theatrical plays, musical entertainments —chiefly by foreign artists—became regular pastimes. The country was badly ruled; foreign policy was venal. Russia took part in European wars with little benefit for itself. From reign to reign the noble guards gained in influence, as they practically disposed of the throne.

Catherine I (1725–27) was followed by the rightful heir, Peter II (1727–30), thanks to a compromise between Menshikov and the representatives of the old nobility. His reign was fraught with struggle between the two. But Anna Ivanovna, the widowed duchess of Courland (daughter of Ivan V), had a claim to the throne. The aristocrats offered her the throne on the condition of limiting her power by the supreme council (created under Catherine I) in questions of her marriage, succession, war and peace, taxation, military appointments, etc. Anna signed, but, profiting by the dissensions of the gentry and nobility, tore up the signed charter and reigned as an autocrat (1730–40), aided by her favourite, Ernst Johann Biron. She tried to secure the succession in the lineage of her sister, the deceased Catherine of Mecklenburg, by designating as successor under the regency of Biron the baby Ivan VI, just born to her niece, Anna Leopoldovna, duchess of Brunswick. Anna Leopoldovna herself succeeded Biron as regent on Nov. 20 (N.S.), 1740, but on Dec. 6 (N.S.), 1741, the guards showed their hatred of the rule of the "Germans" by overthrowing her regency and enthroning Elizabeth, Peter the Great's daughter, who was expected to return to Peter's national policy. Indeed, the first fruits of Peter's reforms ripened during Elizabeth's reign (1741–62): national poetry, a theatre, and the first Russian university (Moscow, 1755), all auguring a deeper culture and knowledge for the next generation.

Elizabeth wished to secure the throne for the lineage of her sister Anna of Holstein-Gottorp, and she invited her nephew Peter, educated in the Lutheran religion and in the ideas of Prussian drill, to come to St. Petersburg to learn Orthodoxy and Russian habits. He came and was married (1745) to Princess Sophia of Anhalt-Zerbst, the future Catherine II. He was no mate for her. As fast as he lost Russian sympathy by his open aversion to everything Russian, Catherine ingratiated herself by exactly opposite behaviour. After half a year of the reign of Peter III, Catherine was raised by the guards officers to the throne. The brother of her favourite Count Grigori Orlov, Aleksei, killed Peter on July 17 (N.S.; 6, O.S.), 1762.

BY COURTESY OF THE STATE TRETYAKOV GALLERY, MOSCOW

CATHERINE II AS PAINTED BY D. G. LEVITSKY (1735–1822)

For a representation of the succession to the throne of Peter the Great *see* the genealogical table in the article Romanov. Consult also the articles on the several emperors, empresses, and regents just mentioned: Anna (Anna Ivanovna); Anna (Anna Leopoldovna); Biron, Ernst Johann; Catherine I; Elizabeth (Elizaveta Petrovna); Ivan; Peter II; and Peter III.

2. Catherine II the Great.—The long reign of Catherine II was a turning point in Russian history. She received the fruit of half a century's evolution since Peter the Great's reforms. A prolific writer herself, in regular correspondence with the foremost men of her age, with Voltaire, Diderot, Jean le Rond d'Alembert, Baron Friedrich Melchior de Grimm, etc., not to speak of fellow potentates such as Frederick II, Maria Theresa, and Joseph II, she wished to make her reign brilliant and herself an ideal enlightened monarch. She began her reforms by compiling from Montesquieu and Cesare Bonesana, marchese di Beccaria, an instruction (*nakaz*) on the basis of which a new code of laws was to be composed. In order to discuss it she gathered an elective assembly of 564 deputies chosen from all classes except the clergy and the serfs, and from all parts of the empire. However, she met with opposition on the part of the gentry to her schemes to fix within definite limits their power over the serfs. Far from engaging in a struggle with the ruling class she yielded to their desires; their power was increased and a number of crown estates were distributed among the ranks of her favourites, thus turning their peasant population into serfs.

Catherine then began to search for glory in foreign politics. She conceived a bold scheme: (1) to recover from Poland the western provinces with an Orthodox Belorussian and Ukrainian population and (2) to take possession of the Black Sea shore, drive the Turks from Europe, and found in their place a series of new states in Moldavia and Walachia, in the Balkans and in Greece. She wished to take Constantinople and to place there her second grandson, Constantine, as the emperor of a new Greek empire. His very name was chosen to symbolize this project. Catherine was favoured in accomplishing at least a part of these designs by discords between two German states, Prussia (under Frederick II and Frederick William II) and Austria (under Joseph II, Leopold II, and Francis II). In her first Turkish war (1768–74) she had Prussia on her side and Austria against her; after P. A. Rumyantsev's victories she concluded a peace at Kuchuk Kainarji, the beginning of the Eastern Question (*q.v.*), as by it Russia received the right to protect Turkish Christians. Moreover, in 1772 she took part in the first partition of Poland, proposed by Frederick II in order to consolidate his territory and to compensate Russia for its war expenditure. In the second Turkish war (1787–91) Catherine had Austria on her side and Prussia against her. She had to content herself, after the victories of Aleksandr Vasilievich Suvorov, Count Rimnikski, and Prince N. V. Repnin, with the acquisition of Ochakov and the steppe between the Dniester and the Bug. But she consoled herself with new annexations from Poland (the second partition, 1793, and the third partition, 1795; *see* Poland), while Prussia and Austria were busy fighting against the French Revolution. Catherine also annexed Courland (1795).

Catherine's numerous lovers flattered her imperial ambitions: the bold Grigori Orlov (*q.v.*) in her early years (1759–71), the ingenious Prince Grigori Potemkin (*q.v.*) in the midst of her reign (1776–91), and the young Platon Zubov, handsome but insignificant, in her declining years (1791–96).

Between her two Turkish wars Catherine returned to the legislative mania of her early years. Made wise by her experience with the commission of the code of 1767, she turned from Montesquieu to William Blackstone and profited by the administrative knowledge of J. Sievers, a skilful adviser of German Baltic origin. She then published in 1775 her statute of provinces, a good piece of organic legislation. For the first time in Russian history a local unit of administration, judiciary, and self-government was created. The statute introduced a regular system of courts of justice and separate financial and administrative offices. The system lasted until the reforms of Alexander II. The reform of 1775 was completed by two charters granted in 1785 to nobility and to burgesses. The charter of nobility introduced corporations of local gentry meeting every three years to discuss their affairs and to elect their marshals. It served to perpetuate the power of the ruling class until the liberation of the serfs in 1861, while the burgesses' charter laid the basis for real municipal self-government.

The protection extended to the gentry inevitably created a growing disaffection on the part of the serfs, who since Peter III's manifesto relieving the gentry of compulsory military service had impatiently awaited their turn for emancipation. In 1773 the Yaik (Ural) Cossacks revolted under E. I. Pugachev (*q.v.*), who called himself Peter III. He roused the Bashkirs and the serfs allotted to the factories in the Urals, assailed Kazan on the Volga and sacked it. Through the whole empire the peasants only awaited his coming to rise, but he did not feel equal to the task, nor could his bands stand against regular troops. He therefore suddenly returned to Cossack country, where he lost his army; he was extradited by his associates, tried, and beheaded in Moscow.

Catherine definitely turned her back on the liberal ideas of her youth after the beginning of the French Revolution. She began to persecute representatives of the advanced opinion which she herself had helped to create. A. N. Radishchev, the author of a spirited book, *A Journey from Petersburg to Moscow,* was sentenced to death as a Jacobin in 1790, but the sentence was commuted to ten years' exile in Siberia. N. I. Novikov, a Freemason who accomplished admirable educational and editorial work, was sent to Schlüsselburg prison in 1792.

3. Paul I.—Catherine's son and successor, Paul, mounted the throne on Nov. 17 (N.S.; 6, O.S.), 1796, when he was 42, barely sane, and with a bitter feeling of having been deprived by his mother of his right to succeed his assassinated father, Peter III. He hated Catherine's favourites and her policy, both internal and external. Paul stabilized the succession of the Russian throne by his imperial family statute (1797; in force until 1917). He sent Suvorov to Italy to fight against the French Revolution, and he ended his reign while preparing with Napoleon an expedition to India against England. In social questions Paul's policy was also inconsistent: he alleviated the serf's compulsory work for his landlord by reducing it to three days a week, but he gave away the peasants of the crown to noble proprietors as serfs in an even larger number than Catherine had (120,000 yearly). This did not make him popular among the nobility, however, as his exalted idea of the emperor's divine right caused him to treat them in a purely oriental way. He used to say that a person could be reputed of importance only as long as he was permitted to converse with his majesty. His ill-balanced mind and tyrannical proclivities inspired fear in his associates, and in the sixth year of his reign he was assassinated, on March 23 (N.S.; 11, O.S.), 1801, by court conspirators led by Gen. Count L. A. von Bennigsen.

C. Alexander I

Paul's son and successor began his reign, as had Catherine (whom he professed to imitate), with attempts at liberal legislation, which gave place to active foreign policy and wars. There followed a new attempt at a constitutional reform, hampered by the nationalist opposition, which urged and approved the annexation of Finland and Bessarabia. The invasion of Napoleon (1812) brought the national feeling to extreme tension. The following years were devoted to the assertion of Russia's influence in Europe. The last years of the reign were marked by a reactionary policy, which provoked the first revolutionary movement in Russia.

BY GRACIOUS PERMISSION OF HER MAJESTY QUEEN ELIZABETH II

DETAIL FROM A PORTRAIT OF ALEXANDER I PAINTED BY SIR THOMAS LAWRENCE (1769–1830)

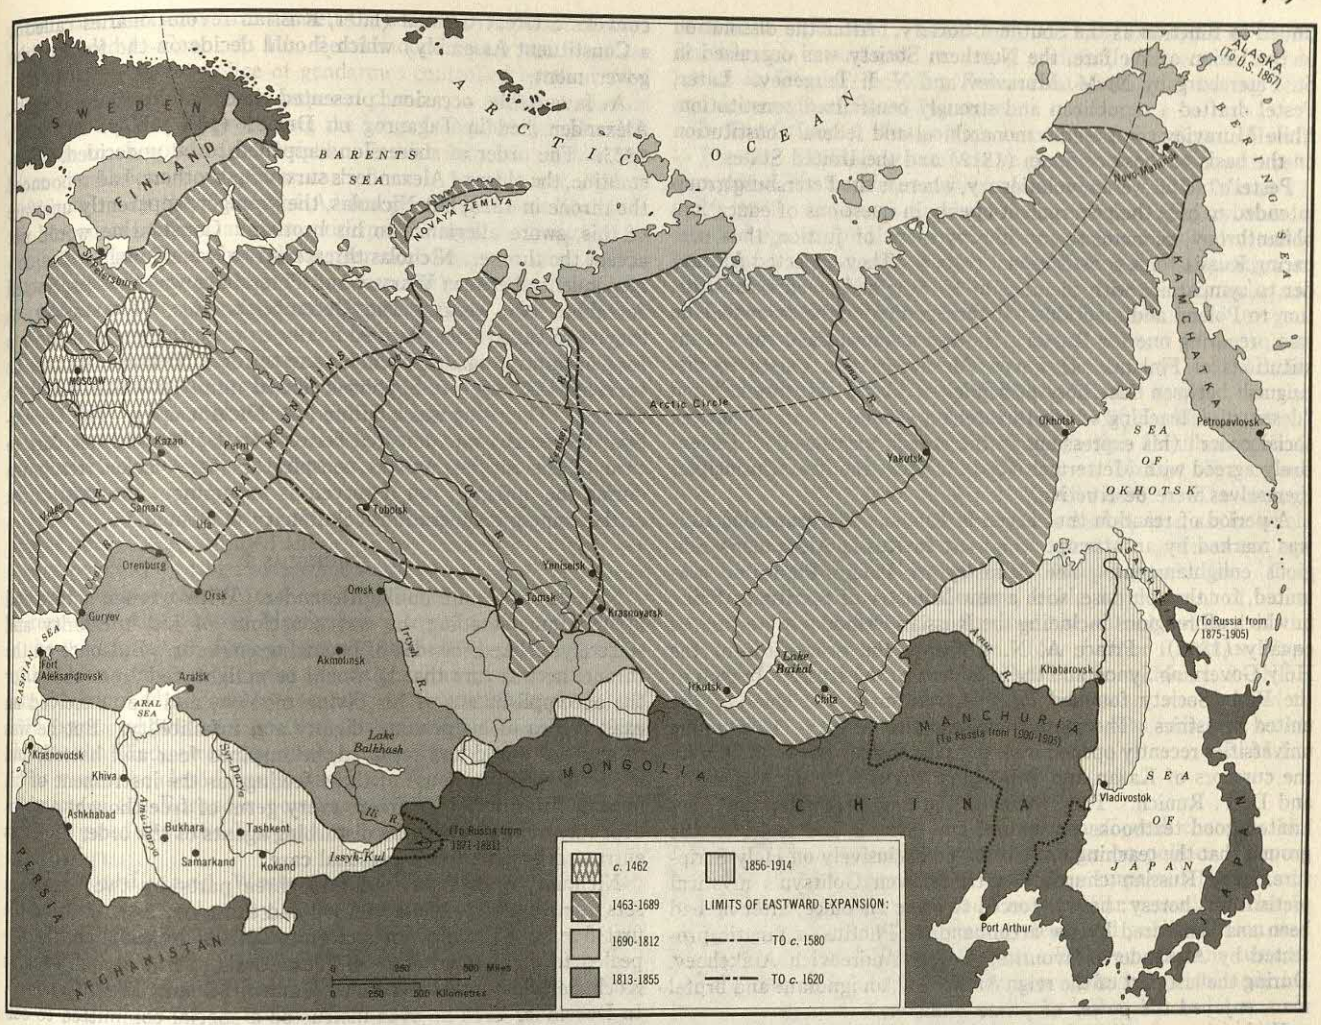
Alexander received a careful education at the hand of his grandmother, who wished him, instead of his father, to inherit the throne. The Swiss republican F. C. de La Harpe had a strong influence on him in his early years (1784–95). But this education was interrupted by Alexander's marriage at the age of 16 and did not go beyond imparting to him some general ideas unsustained by exact knowledge. His sentimental feelings were cooled by the court intrigues, by the hidden enmity between his grandmother and father, and finally by the harsh system of Paul's reign, which Alexander was expected to approve and obliged to share in. The consequence was that he grew up a past master in dissimulation and self-restraint. His evasiveness in face of other people's strong opinions was often taken for weakness. But he knew how to promote his own views, and if impeded in his designs he was capable of violent explosions of wrath.

1. Initial Liberalism.—In the first year of his reign Alexander surrounded himself with a few friends of his youth—N. N. Novosiltsev, P. A. Stroganov, Prince Adam Jerzy Czartoryski, Prince V. P. Kochubei—a "private committee" whom he wished to help him in drafting large schemes of reforms. He at once canceled a series of reactionary measures of Paul and declared his desire to abolish arbitrariness and to inaugurate a reign of law. Public opinion received Alexander with enthusiasm. But the private committee, which met regularly from 1801 till the end of 1803, found dangerous and untimely both a formal declaration limiting the autocrat's power and the abolition of serfdom. The most important fruit of these good intentions was the introduction of ministries instead of the colleges of Peter the Great, which had been practically abolished by Catherine. A new senate statute was intended to make this institution the highest legal authority (1802).

A very cautious *ukaz* of 1803 permitted noble landowners to liberate their serfs, granting them at the same time parcels of land. Only 47,000 serfs were to be thus liberated. Somewhat larger measures limited the power of landowners over the serfs in Livonia and Estonia (1804–05). A new and important impulse was given to public education, which was considered to be a preliminary condition to all substantial reforms. Three new universities were created.

Since 1801 Alexander had feared the consequences of Napoleon's ambition, and in 1804 he joined a new coalition against France formed by England. He was involved in wars which ended in crushing defeats at Austerlitz and Friedland. He then changed his policy and concluded an accord with Napoleon directed against England, whose commerce with the continent had to be forbidden in all countries which adhered to this continental system. At his personal meeting with Napoleon at Tilsit (June 25, 1807) Alexander played a part which made Napoleon call him a "northern Talma" (a renowned actor) and a "Byzantine Greek." But he was in part genuinely under Napoleon's influence and was entangled in other wars: with Sweden, which finished with Russian annexation of Finland (1809), and with Turkey, which lasted for six full years (1806–12) and ended with Russian annexation of Bessarabia. A year after the Tilsit meeting (Oct. 12, 1808) Alexander again met Napoleon, at Erfurt, but Napoleon's intention to raise the Polish question did not please Alexander. Relations were very strained by the end of 1810.

Conservative opinion was very much incensed against Alexander's alliance with the "Corsican usurper," especially as at that very time another and more serious attempt was made to introduce in Russia a constitutional government. Mikhail Mikhailovich Speranski, a prominent statesman whose views were favoured by



RUSSIAN TERRITORIAL ACQUISITIONS IN ASIA BEFORE 1914

the emperor at that time, prepared a moderate scheme based on the introduction of self-government in four stages, beginning with electoral assemblies (dumas) in the cantons and ending at the top with the duma of the state. Each lower duma elected deputies to the upper one: cantonal to district, district to provincial; these latter sent all their members to the state duma, a legislative assembly deprived of legislative initiative but enjoying the right to make motions concerning the interest of the state, the responsibility of functionaries, and the violation of fundamental laws. The senate retained only judicial power, while the newly reformed ministries remained organs of the executive. The council of state, composed of high dignitaries and presided over by the emperor, was to prepare drafts of laws. In fact, nothing except the council of state and the reformed ministries was realized. Conservative opinion, as represented by nobility and bureaucracy, was furious with Speranski, and the emperor did not choose to defend him. On a futile pretext Speranski was dismissed from his office of imperial secretary and sent into exile (1812). His successor was an extreme nationalist and conservative, Adm. A. S. Shishkov.

2. Nationalism and Reaction.—When the War of 1812 began, the patriotic feeling reached its pitch. It was to be a Scythian war—a war of retreat. Time and space were to be the chief allies of Russia, whose military forces were one-half or one-third the size of Napoleon's. And, indeed, the deeper Napoleon penetrated into Russia's endless plain the more equal the chances became. Alexander named M. I. Kutuzov commander in chief (in the place of M. B. Barclay de Tolly) and Count F. V. Rostopchin governor of Moscow, the capture of which was the final aim of Napoleon's strategy. After the bloody but undecided battle at Borodino (*see* BORODINO, BATTLE OF) Moscow was abandoned by its residents. For five weeks of his stay in the city Napoleon waited in vain for a peace proposal. Moscow was burned by the inhabitants and by the marauders of the Grand Army. The latter was in process of dissolution, and winter was approaching. Then followed the famous retreat, during which the Grand Army was nearly annihilated, and the wars of liberation of 1813 and 1814, which brought Alexander and his army to Paris. (*See* further NAPOLEONIC WARS.)

All these events produced an enormous impression on the sensitive temperament of Alexander. "The fire of Moscow," he said later to the German pastor R. F. Eylert, "lit up my soul, I then got to know God and became another man." Alexander now found in the Bible the proofs of his mission and proposed to his allies to establish a Holy Alliance (*q.v.*), a monarch's league based on the precepts of the Scriptures. At the Congress of Vienna (1815) Alexander figured as a saviour of Europe, and he continued to play a leading part at Aix-la-Chapelle (1818), Troppau (Opava) and Laibach (Ljubljana, 1820–21), and Verona (1822).

3. The Revolutionary Movement.—Quite different were the impressions brought back to Russia by the younger generation of officers who took part in the Napoleonic Wars. Many of them while abroad read political newspapers and were present at the debates of representative assemblies. They learned to quote the books of J. L. Delolme, Count A. Destutt de Tracy, Benjamin Constant, Gaetano Filangieri, Baron Louis Bignon, etc. After their return to Russia they were shocked by the contrast of arbitrary rule, the abuses of bureaucracy, the venality and secrecy of the courts, the sufferings of the serfs, and the indifference to popular education. The secret Union of Salvation (later called the Society of True and Loyal Sons of the Motherland) was established in 1816 but was soon closed. The Union of Welfare, founded in 1818, was disbanded in 1821, but its Southern Board in the Ukraine, led by Pavel Ivanovich Pestel, ignored the dissolution order and con-

tinued to function as the Southern Society. After the dissolution of the Union of Welfare, the Northern Society was organized in St. Petersburg by N. M. Muraviev and N. I. Turgenev. Later, Pestel drafted a republican and strongly centralized constitution, while Muraviev composed a monarchical and federal constitution on the basis of those of Spain (1812) and the United States.

Pestel's tactics were revolutionary, whereas the Petersburg group intended to help the government openly in questions of education, philanthropy, economics, and improvement of justice, thus preparing Russia for a constitutional regime. They expected Alexander to sympathize with them, as in 1815 he had given a constitution to Poland and mentioned at the opening of the *sejm* that he was preparing one for Russia. He also acknowledged the old institutions of Finland. However, Alexander soon ceased to distinguish between "the holy principles of liberal institutions" and "destructive teaching which threatens a calamitous attack on the social order" (his expressions in the speech mentioned). He entirely agreed with Metternich (in 1820) that the liberal principles themselves were destructive.

A period of reaction thus began in Russia. The transition to it was marked by an attempt to impart to Russia Alexander's religious enlightenment. The Ministry of Public Education was united, for that purpose, with a new Ministry of Spiritual Affairs, in which all religions including the Russian Orthodox were treated equally (1817). Prince A. N. Golitsyn, the procurator of the Holy Governing Synod and the president of the Russian branch of the Bible Society founded in 1814, was made the chief of the united ministries. The consequence was that in 1819–21 the young universities recently opened were entirely destroyed—especially by the curators of Kazan and Petersburg circuits, M. L. Magnitski, and D. P. Runich. They removed the best professors and prohibited good textbooks on natural law, morals, and logic, on the ground that the teaching must be based exclusively on Holy Scripture. For Russian church dignitaries even Golitsyn's mystical pietism was heresy: he was forced to leave his office, after he had been anathematized by the archimandrite Photius, a fanatic protected by Alexander's favourite, Aleksei Andreevich Arakcheev. During the last part of the reign Arakcheev, an ignorant and brutal man, enjoyed the power of prime minister.

Under these conditions secret societies changed their character. The measures of Alexander convinced them that monarchs' promises are not to be relied upon. They were also impressed by military pronunciamentos in Spain and Naples (1820). Turgenev recorded in his diary in 1820: "We formerly asked, every time we met the readers of newspapers in the club, whether there was a new constitution. Now we ask whether there is a new revolution." One may judge of the impression produced on the officers of the guard when they learned that they had to stifle the Neapolitan uprising, by orders of the Laibach Congress.

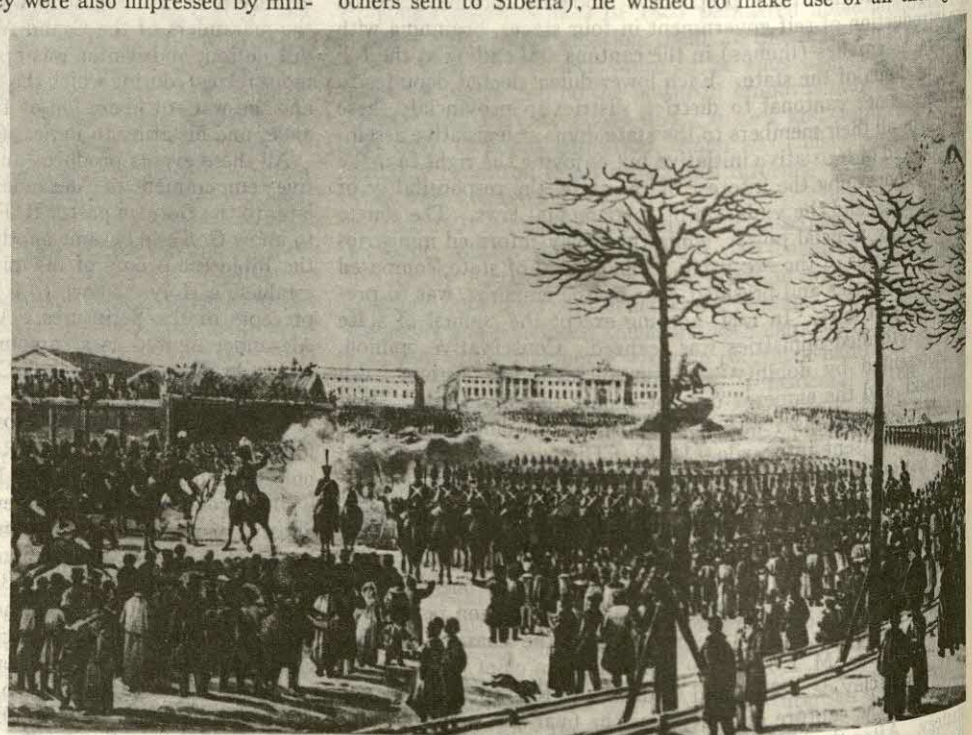
The constitutionalists were losing ground; radical elements even among them (like the poet K. F. Ryleev) began to prevail. Proposals of regicide were heard from P. G. Kakhovski and A. I. Yakubovich but were rejected or indefinitely postponed. In any case, revolutionary tactics were considered inevitable, but no definite scheme was in preparation. Suggestions were made for forcing the emperor, at some favourable opportunity, to nominate a liberal ministry under Speranski and N. S. Mordvinov, who would convoke a Great Council (later, Russian revolutionaries called it a Constituent Assembly) which should decide on the form of the government.

A favourable occasion presented itself quite unexpectedly. Alexander died in Taganrog on Dec. 1 (N.S.; Nov. 19, O.S.), 1825. The order of succession happened to be undecided. Constantine, the elder of Alexander's surviving brothers, had renounced the throne in 1823, but Nicholas, the younger, apparently unaware of this, swore allegiance to his brother. Constantine would not accept the throne. Nicholas threatened to leave Russia. The correspondence between Warsaw and Petersburg was thus protracted for about two weeks. The Decembrists (*see* DEKABRISTS), as they were called later, decided finally to raise the guard regiments for Constantine against Nicholas and to force Nicholas—in case he survived that day—to appoint a liberal ministry which would do the rest. The rising was a failure (*see* NICHOLAS I). The Decembrist movement was defeated because its leaders did not dare to turn to the masses, and as conspirators they lacked resolution during the uprising; but it served as an ominous prognostication of the coming democratic revolutionary movement.

D. NICHOLAS I

Nicholas was quite unlike Alexander. With a rough nature and limited understanding, he was conscious of his inferiority and sincerely disliked the idea of becoming emperor. But once on the throne, he was sure that he would be enlightened from above for the accomplishment of his divine mission, and he conceived an exalted idea of his personal dignity and infallibility. But he was no mystic. Cold and reserved, he inspired fear and hatred, and he consciously made use of these feelings as the instrument of his power. His aim was to freeze every germ of free thought and independent moral feeling, as disturbing agents of the order of things entrusted by God to his personal care.

Nicholas' reign is divided into three parts by two European sets of revolutions: those of 1830 and those of 1848. During the first five years he did not feel quite sure of himself, and he appealed for help to advisers of Alexander's liberal period, such as Kochubei, Speranski, and E. F. Kankrin (Count Georg Cancrin). In December 1826 he even instructed a special committee to collect for him all useful hints about necessary reforms. While punishing severely the Decembrists (five of them were hanged, others sent to Siberia), he wished to make use of all their good



SOVFOTO

NICHOLAS I (MOUNTED ON WHITE HORSE AT LEFT) ORDERING CANNON TO BE FIRED ON THE DECEMBRIST REBELS, DEC. 26, 1825. PAINTING BY K. I. KOLMAN

ideas. But he reserved for himself the control over public opinion and confided to Count A. Kh. Benckendorff (*q.v.*) the organization of a new secret police of gendarmes controlled by the "third section" of the personal and imperial chancery. Nicholas adopted Alexander's policy of protecting the kings from their peoples, but he made an exception for Christian Turkish subjects (in the first place the Greeks). He thus carried on a war against Turkey (1828–29). By the Treaty of Adrianople, Greece was liberated; the hospodars of the Danubian principalities were to be appointed for life and free from Turkish interference in internal affairs. The Straits (the Dardanelles and the Bosporus) and the Black Sea were to be open. (*See* EASTERN QUESTION.)

Nicholas especially attended to education; he wished to clear it of everything politically dangerous and confine it to the upper class. He abolished the liberal university statutes of Alexander (1804); by the new statutes of 1835 he detached the primary education intended for the lower classes from the gymnasiums and universities, where only children of gentry and of officials were to be admitted.

The expulsion of Charles X from France and the Polish insurrection of 1830–31 determined the legitimist tendency of Nicholas' foreign policy; he wished to become a real "policeman" of Europe, and at Münchengrätz (Mnichovo Hradiste), in September 1833, he renewed relations with Metternich. But his excessive interest in the "sick man" in Constantinople finished by rousing Europe against him. In 1833 Nicholas saved the sultan from the Egyptian rebel Mohammed Ali, and by the treaty of Unkiar-Skelessi (July 8, 1833) appeared to receive for that service free passage for Russian ships to the Mediterranean, while to all other powers the Dardanelles were to be closed during wartime. This concession drew the attention of the European powers, and in 1841 all the five great powers agreed that the Dardanelles should be closed to warships of all nations.

1. Slavophils and Westernizers.—In sharp contrast with Nicholas' educational policy, a new generation grew up which was bred by Russian universities, especially Moscow University, between 1830 and 1848. They were not politicians or liberals of a Franco-English type. They were idealists and students of the philosophy of Schelling, Fichte, and Hegel. In Moscow literary salons they did not discuss the form of the government, but dug deep into the very foundations of Russian history and the Russian national mind. Most of them declared that Russia was unlike Europe and that its type of civilization was potentially far higher than the European. They execrated Peter the Great's Europeanization of Russia as a fatal deviation from the genuine course of Russian history, and they wanted Russia to come back to the forsaken principles of the Eastern Church and state—to orthodoxy and autocracy. The majority of public opinion, led by A. I. Herzen, V. G. Belinski, Mikhail Bakunin, T. N. Granovski, and others, revolted against this Slavophil doctrine. They opposed to it their own doctrine of the Western origin of Russian civilization. Herzen and Bakunin emigrated from Russia on the approach of the revolutions of 1848. They became the originators of Russian socialism, and Herzen saw socialist elements in the Russian peasants' commune (mir).

Nicholas was not insensible to the chief social question in Russia —that of serfdom. How could he be when peasants' uprisings were steadily growing in frequency? They numbered about 41 in the first four years of his reign, and there were 378 between 1830 and 1849 and 137 during the last five years. Nicholas formed a series of secret committees which, after many failures, prepared the law of 1842 on voluntary accords, which abolished personal serfdom and fixed the amount of peasant lots and payments. Through P. D. Kiselev's energy, the same changes were introduced in Poland (1846) and in Russian provinces (1847).

A real persecution of intellectuals began after the revolutions of 1848. A secret committee, presided over by D. P. Buturlin, was founded to punish press offenses. S. S. Uvarov himself was found too liberal, and he resigned. His successor, Prince P. A. Shirinski-Shikhmatov, wished to "base all teaching on religious truth." The university chairs of philosophy were closed, the number of students limited; many writers were arrested, exiled, or otherwise punished. The private circle of followers of M. V. Butashevich-Petrashevski, a young socialist, was sent to forced labour in Siberia (including Fedor Dostoevski) for having read and discussed prohibited literature.

2. The Crimean War.—Nicholas also wished to dictate his will to Europe. "Submit yourselves, ye peoples, for God is with us": thus ended his manifesto published on April 8 (N.S.; March 27, O.S.), 1848. He sent a Russian army to subdue Hungary when it revolted against the Habsburgs. A few years later he inadvertently provoked a conflict with Turkey, because of a special question on the distribution of holy places in Jerusalem between Catholic and Orthodox priests, which he involved with the question of the general protectorate of Russia over Christian subjects of the sultan. European powers would not admit this protectorate, and Nicholas found against himself not only Napoleon III and England but also "thankless Austria." On Oct. 23 (N.S.), 1853, Turkish forces attacked the advanced Russian troops in the Danubian principalities; on Nov. 1, Russia declared war on Turkey. France and England declared war on Russia on March 27, 1854. The courage displayed in the defense of Sevastopol proved useless, as the whole fabric of Russian bureaucratic and autocratic government appeared incapable of competing with European technique. Corruption and lack of communication, feeble development of industry, and financial deficiency deprived the valiant soldiers of the most necessary means of defense. (*See* further CRIMEAN WAR; TURKEY.) Nicholas died in St. Petersburg on March 2 (N.S.; Feb. 18, O.S.), 1855, feeling that all his system was doomed to destruction. A wholesale change of regime was indicated to his son and successor, Alexander II. (P. M.)

E. ALEXANDER II

The emperor Alexander II (*q.v.*), a man of weak character but good-natured, possessed no steadfast views on politics. During the reign of his father he had sometimes surpassed Nicholas in reactionary intentions. But the Crimean War proved too clearly the danger of Nicholas' martinet system, and public opinion was too impetuous for Alexander to resist. He swam with the current, and this period coincides with the great reforms which made his reign a turning point in Russian history. But Alexander was always conscious of his power as unlimited monarch, and his liberalism ended as soon as his reforms brought with them a revival of political or autonomous tendencies. He then began to waver; the reforms were left unachieved or curtailed. Public opinion grew impatient, extremist tendencies won the ground, and the gap between the government and advanced opinion finally became insuperable. As a consequence, the original impulse for reform was exhausted as early as 1865. There followed a period of faltering which turned into a sheer reaction as the revolutionary movement grew.

1. Emancipation of the Serfs.—The greatest achievement of the era was the liberation of peasants. It paved the way for all other reforms and made them necessary. It also determined the line of future development of Russia. The chief motive which decided Alexander is clearly expressed in his words to the Moscow gentry: "The present position cannot last, and it is better to abolish serfdom from above than to wait till it begins to be abolished from below." Alexander knew, of course, of the mounting dissatisfaction of the peasants and of support of their grievances by the progressive intelligentsia. However, he met with passive opposition from the majority of the gentry, whose very existence as a class was menaced.

The preparatory discussion lasted from 1857 to March 1859, when the drafting commissions of the main committee were formed, composed of young officials enthusiastically devoted to the work of liberation. Ya. I. Rostovtsev, an honest but unskilled negotiator enjoying the full confidence of the emperor, was mediator. The program of emancipation was very moderate at the beginning, but was gradually extended, partly under the influence of the radical press and especially Herzen's *Kolokol* ("The Bell"). But Alexander wanted the initiative to belong to the gentry, and he exerted his personal influence to persuade reluctant landowners to open committees in all the provinces, while prom-

ising to admit their delegates to discussion of the draft law in Petersburg. No fewer than 46 provincial committees comprising 1,366 representatives of noble proprietors were at work during 18 months preparing their own drafts for emancipation. But they held to the initial program, which was in contradiction with the more developed one. The delegates from the provincial committees were only permitted—each separately—to offer their opinions before the drafting committees.

By the law of March 3 (N.S.; Feb. 19, O.S.), 1861, the peasant became personally but formally free, and his landlord was obliged to grant him his plot for a fixed rent with the possibility of redeeming it at a price to be mutually agreed upon. The peasants remained "temporarily bonded" until they redeemed their allotments. The redemption price was calculated on the basis of all payments received by the landlord from his peasants before the reform. If the peasant desired to redeem his plot, the government paid at once to the landowner the whole price (in 5% bonds), which the peasant had to repay to the exchequer in 49 years. Although the government bonds fell to 77% and purchase was made voluntary, the great majority of landowners—often in debt—preferred to get the money at once and to end relations which had become insupportable. By 1880, 15% of the peasants had not made use of the redemption scheme, and in 1881 it was declared obligatory. The landowners tried, but in vain, to keep their power in local administration. The liberated peasants were organized in village communities that held comprehensive powers over their members. Nominally governed by elected elders, they were actually administered by crown administrative and police officials.

2. Administrative Reforms.—After the emancipation of the peasants, the complete reform of local government was necessary. It was accomplished by the law of Jan. 13 (N.S.; 1, O.S.), 1864, which introduced the district and provincial *zemstva* (county councils). Land proprietors had a relative majority in these assemblies. The gentry and officials were given (in all Russia) 42% of the seats, merchants and others 20%, while the peasants had 38%. The competence of *zemstva* included roads, hospitals, food, education, medical and veterinary service, and public welfare in general. Before the end of the century services in provinces with *zemstvo* (*q.v.*) government were far ahead of those in provinces without.

A third capital reform touched the law courts. The law of Dec. 2 (N.S.; Nov. 20, O.S.), 1864, put an end to secret procedure, venality, dependence on the government, etc. Russia received an independent court and trial by jury. The judges were irremovable; trials were held in public with oral procedure and trained advocates. Appeals to the senate could take place only in case of irregularities in procedure.

A little later came the reforms of municipal self-government (1870) and of the army (1874). Gen. D. A. Milyutin (the brother of N. A. Milyutin) reduced the years of active service from 25, first to 15 and then, by the law of 1874, to 6 years, and made military service obligatory for all classes. The term of service was further shortened for holders of school diplomas. Military courts and military schools were humanized.

3. The Revolutionary Movements.—One branch of public life exempted from reform was the press, though it profited by the new spirit of Alexander's reign. While in the last ten years of Nicholas' reign only 6 newspapers and 19 (mostly specialist) monthlies were permitted, during the first ten years of Alexander's reign there were 66 newspapers and 156 monthlies. The general tendency of the press, very moderate at the beginning, soon became very radical. The leading spirits were the nihilists N. G. Chernyshevski, N. A. Dobrolyubov, and D. I. Pisarev, the last of whom preached extreme individualism. As early as 1862 temporary measures were applied against radical periodicals. Instead of a law on the liberty of the press, there appeared in 1865 new temporary rules (which remained in force for fully 40 years) compiled from Napoleon III's law of 1852. They set free from preliminary censorship books of more than ten sheets, but the censors continued to seize printed books before their issue.

A new wave of revolutionary movement set in. It proceeded from the young generation of university students, who expected an agrarian revolution directly after the liberation of the peasants. They were busy preparing workingmen, soldiers, and peasants for it through popular education. Secret circles were formed, proclamations were issued, and even a revolutionary movement was attempted in connection with the Polish uprising of 1863. Finally, an attempt was made by a student, D. V. Karakozov, to assassinate the tsar in April 1866. All these attempts were extremely naïve. A few young revolutionaries were executed or sent to Siberia, but the whole movement, though curtailed, was not destroyed.

Alexander was frightened. Gradually he dismissed his liberal advisers, and conservatives took their place. The Home Office was given (1861) to P. A. Valuev, who tried to paralyze the introduction of the emancipation law and formally prosecuted its faithful adherents. University troubles brought about the removal of the liberal minister of public instruction, A. V. Golovnin, the author of a university statute of 1863 that provided for university autonomy. His successor was a reactionary, Count Dimitri Andreevich Tolstoi. The old chief of gendarmes, Prince V. A. Dolgorukov, had to give place, after Karakozov's attack, to Count P. A. Shuvalov, who became the soul of reaction. The government-general of St. Petersburg was abolished, and the martinet Gen. F. F. Trepov was made grand master of the police. D. N. Zamyatnin, minister of justice, under whom the reform of tribunals was carried through, fell a victim to his defense of this reform against an imperial whim; he had to yield to an ignorant reactionary, Count K. I. Pahlen (1867), who nearly annihilated the reform. The same was done for the press by A. E. Timashev, who superseded Valuev as home minister in 1868. Two radical monthlies, the *Sovremennik* ("The Contemporary") and the *Russkoe Slovo* ("Russian Word"), were closed (1866). M. N. Katkov, a former European liberal who now inclined to extreme

nationalism and reaction, became the most influential journalist.

Populism.—All this contributed to uphold and to increase the disaffection of educated public opinion. About 1869 a new young generation appeared which gave expression to that state of mind. Russian emigrants in Switzerland discussed at that time a new revolutionary doctrine later called populism (*see* NARODNIKI). P. L. Lavrov was giving it a "scientific" basis, but Bakunin found this too learned and plainly invited the youth to give up the study and go straight to the people (the slogan "going to the people" was coined by Herzen in 1861) with the aim of inducing disorder. He found this easy, since Russian peasants with their communes were born socialists. The youth of Russia, chiefly the young girls who went to study abroad as there were no institutes of learning for females in Russia, listened to these discussions in Zürich and, of course, most preferred Bakunin's active optimism to Lavrov's learning.

In 1873 they were all ordered back to Russia by the government, and they met, when at home, with many student circles which were busy distributing books and revolutionary pamphlets among their provincial branches and workingmen. N. V. Chaikovski, Prince P. A. Kropotkin, and Sergei Stepnyak (S. M. Kravchinski) were among the leaders of that educational and (later on) revolutionary work. They decided to go to the people—a naïve crusade by inexperienced youth, hardly out of their teens—in order both to teach the people and to learn from them their socialist wisdom. Of course they were not acknowledged by the people, in spite of their peasant attire, and were easily ferreted out by the police; 770 were arrested and 215 sent to prison.

Terrorism.—These active students then decided to change their tactics. A regular secret society was founded in 1876 under the name of Zemlya i Volya ("Land and Freedom" [or "Will"]). They still hoped to provoke a mass uprising according to the ideals of the people, but their village settlements proved useless for revolution, while in the towns they soon got engaged in a lively conflict with the police. As a result the terrorist side of their activity came to the forefront. In the autumn of 1879 the terrorist group formed a separate party, the Narodnaya Volya ("People's Freedom"), while the remaining members led by G. V. Plekhanov—under the name of Black Redistribution (*i.e.*, agrarian revolution)—remained inactive. A series of terrorist acts then followed, beginning with that of Vera Ivanovna Zasulich, who fired on Trepov for his having flogged a prisoner and was acquitted by the jury (1878). In April 1879 A. K. Soloviev fired five shots at the emperor. In February 1880, a workman, S. N. Khalturin, blew up the imperial dining room at the Winter Palace. The police seemed powerless against the famous Executive Committee which directed the blows, and the government asked the loyal elements of public opinion for support. The answer was given, in the name of the Chernigov *zemstvo,* by Ivan I. Petrunkevich: he said that no cooperation was possible with the government as long as public opinion was stifled. The Tver *zemstvo,* led by F. I. Rodichev, asked the emperor to "give us what he gave to Bulgaria" (*i.e.*, a constitution and political freedom).

Loris-Melikov.—After the Winter Palace explosion a supreme commission was appointed under the chairmanship of M. T. Loris-Melikov, who was given a sort of dictatorial power. Loris-Melikov's design was to isolate revolutionary elements by concessions to the liberals and, after exterminating the revolutionaries, to summon a sort of consultative assembly, thus renewing certain projects of aristocratic landowners in 1861–63. He submitted to the emperor, on Feb. 21 (N. S.; 9, O.S.), 1881, a proposal to appoint two drafting committees for administrative and financial reforms and to submit their drafts to a general commission, where experts chosen by the *zemstva* and municipalities should also be heard (two from each). The respective laws would be issued in the ordinary way by the Council of State, but 15 delegates should be admitted to its session. It did not at all look like a constitution, but it might have served as an introduction to it. Fate decided otherwise: on the very day when he signed Loris-Melikov's project, March 13 (N.S.; 1, O.S.), 1881, Alexander was assassinated by revolutionaries, led by Sofia Lvovna Perovskaya.

4. Foreign Policy.—Alexander II was more successful in his foreign policy. He ascended the throne at a moment of great exhaustion and humiliation for Russia. The Paris treaty (1856) substituted European control for a Russian protectorate over Turkish Christians; the Russian fleet in the Black Sea ceased to exist; the portion of Bessarabia nearest to the Black Sea was given to the Danubian principalities. However, Prince A. M. Gorchakov eluded Napoleon III's attempts to make an international question of the Polish uprising of 1863; Alexander then approached his relative William of Prussia and helped him against France in the foundation of the German empire. Russia made use of the Franco-German War to repudiate the provisions of the Paris treaty forbidding Russia to construct naval arsenals and to keep a fleet in the Black Sea (1870). In 1872 the German, Austrian, and Russian emperors met at Berlin and concluded the Three Emperors' Alliance (or Dreikaiserbund), without any formal treaty being signed. The Russo-Austrian and the Russo-German secret military conventions concluded on Oct. 22, 1873, were by-products of the Berlin meeting, but they seemingly had no effect on the subsequent course of events. In 1875 there were persistent, though unfounded, reports of an impending German attack on France. Gorchakov, much to Bismarck's annoyance, assumed the role of champion of France and European peace and claimed credit for averting the imaginary conflagration. In the same year the Eastern Question (*q.v.*) was reopened by a rising of Christian Slavs in Bosnia-Hercegovina. In May 1876 began the Bulgarian uprising.

Russia proposed cooperative action to the powers, but meeting with hidden aid to Turkey from Disraeli, Alexander decided to act alone. When Serbia and Montenegro declared war on Turkey he met Francis Joseph at Reichstadt, and on July 13 (N.S.), 1876, concluded an agreement in which the possibilities of defeat, victory, or the collapse of Turkey were anticipated. In the event of a Turkish defeat, Austria was to receive Bosnia-Hercegovina for occupation and administration; Russia was permitted to take back the lost portion of Bessarabia. A last attempt to formulate a European program of pacification of the Balkans was made by the powers at the Constantinople conference (November 1876). After its failure Count Nikolai P. Ignatiev, the Russian ambassador to Turkey, visited the European capitals to discuss the possibility of war. Austria and England put as conditions of their neutrality: no attack on Constantinople; no Russian territorial acquisitions; no thrusting Serbia into war; Bulgaria, in case of its liberation, not to be under direct Russian control. Thus, Russia was in advance deprived of possible gains in case of victory; as a matter of fact, Disraeli looked for its defeat. Nevertheless, on April 24 (N.S.), 1877, Alexander went to war (*see* RUSSO-TURKISH WARS). Close to the walls of Constantinople the Russian army was stopped by the British fleet, and the Treaty of San Stefano (March 3, 1878), favourable to the Bulgarians, was emasculated at the Congress of Berlin (*q.v.*). Russian public opinion, ignorant of the agreements concluded before the war, was much incensed against Bismarck, "the honest broker." Russia received the lost part of Bessarabia, and Kars, Ardahan, and Batum in Transcaucasia.

Far more important were the acquisitions of Alexander in Asia. From 1864 his generals were active against Kirgiz and Turkmen tribesmen who raided the unprotected frontier of Siberia. Russian soldiers marched up the Syr-Darya, subjugated Bukhara, and from there, through the desert of Khiva, reached the Caspian shore. In 1867 the territory between Issyk-Kul and the Aral Sea was constituted into a province called Turkistan, and in 1884 another province under the title of Transcaspia was formed of territories between the Amu-Darya and the Caspian Sea. Russia reached the frontiers of Afghanistan and Chinese Turkistan, while in the Far East, by the Treaty of Aigun (Ai-hun; 1858), it obtained, from China, territory running east from the Amur and Ussuri rivers to the Pacific seaboard, and the naval base of Vladivostok was founded. Japan ceded Sakhalin in 1875 in exchange for two Kuril islands. In 1867 Alaska was sold to the United States for $7,200,000.

5. Industrial Progress.—Under Alexander II Russia made further steps toward industrialization. The length of railway increased from 644 mi. (1857) to 2,260 (1867) and to 11,070 (1876).

Factory production grew from 352,000,000 rubles (1863) to 909,000,000 (1879); the number of workingmen from 419,000 to 769,000; the export of grain from 52,800 bu. (1860–62) to 125,600 (1872–74). In 1850 and 1857 Russia (for the second time since 1819) tried the experiment of freer trade, but as it brought with it an excess of imports—a thing unusual in Russia—M. K. Reutern, the minister of finance in 1862–78, returned to the protectionist system of Kankrin (1823–44). He also favoured the organization, for the first time in Russia, of private credit institutions. The 10 land banks which were in existence at the end of the 19th century were all founded in 1871–73; there were also 28 commerical banks (founded 1864–73), 222 municipal banks (1862–73), and 71 societies of mutual credit (1877).

F. Alexander III

1. Administration and Economy.—Alexander III succeeded his father and was at first expected to continue his tradition. But the quasi-constitutional scheme of Loris-Melikov, discussed in March in the Winter Palace, met with the opposition of K. P. Pobedonostsev, the former tutor of Alexander, and his most trusted adviser. On May 11 (N.S.; April 29, O.S.), 1881, appeared a manifesto written by Pobedonostsev without the ministers' knowledge, in which the emperor described himself as "chosen to defend" autocratic power. At the same time a promise was made to continue Alexander II's reforms. Loris-Melikov, with Gen. D. A. Milyutin, at once resigned and was replaced by N. P. Ignatiev, a friend of the Slavophils, who promised to leave untouched the powers of the *zemstva* and municipalities and to alleviate the burdens of the peasants. And indeed, in June and September 1881, Ignatiev summoned the experts selected by the government among liberal *zemstvo* men. With their help he drafted a scheme for lowering the redemption prices, abolishing the poll tax, and regulating internal colonization and land rents. The new minister of finance, N. Kh. Bunge, assisted by opening a peasants' bank; he also enacted the first factory acts (1882) and appointed special factory inspectors to enforce their application. A special commission under M. S. Kakhanov (1881–84) prepared a reform of peasant self-government based on the principle of reducing the legal disabilities of the peasantry. In May 1882 Ignatiev proposed to Alexander to summon a *zemski sobor* in Moscow of about 3,000 representatives from all classes, on the day of the coronation.

Here M. N. Katkov and Pobedonostsev won their victory. Ignatiev resigned; the reactionary Count D. A. Tolstoi took his place as home minister. His tool I. D. Delyanov had enacted in his former ministry a new reactionary statute for the universities (1884). Tolstoi now became the mouthpiece of the nobility and gentry, a decaying class that tried to preserve as much as possible of its vanishing power and property. In 1885 a special Bank for the Nobility was opened with the aim of preserving the landed property of the gentry from final liquidation (for debt). Then Tolstoi proposed to A. D. Pazukhin—a sworn defender of noble privileges—to revise the *zemstvo* institution with the aim of making the nobles' influence paramount in the countryside. As a result, two important laws were published, on Aug. 3 (N.S.; July 22, O.S.), 1889, on land captains, and on June 24 (N.S.; 12, O.S.), 1890, on *zemstva*. The land captains were appointed by the home minister from the local landowners and were vested with practically unlimited powers over the peasantry, their communities, and their elected officials. The composition of district *zemstvo* assemblies was changed from the figures given above to 5,433 representatives of landed owners (57%), 1,273 municipal representatives (13%), and 2,817 representatives of village communities. However, the chief aim of the government was, rather than to favour the gentry, to incorporate both the land captains and the executive boards of the *zemstva* in its civil service by making them subordinate to the provincial governors.

An outstanding feature of Alexander III's reign was an increased persecution of everything dissimilar to the officially accepted national type. Dissenting sects, the Catholic Eastern Rite churches and the Lutherans in the western provinces, Lamaist Kalmyks and Buryats, and especially Jews, suffered a systematic persecution. The press was muzzled, revolutionary organizations were destroyed, and revolutionary movement was stifled. Public opinion was silent until the great famine of 1891; from that year symptoms of a revival appeared. The new movement was different from the populism of the '60s and '70s. The Russian socialists became Marxists. Russia, they argued, was becoming an industrial country, and the numbers of the industrial proletariat were speedily increasing. In fact, I. A. Vyshnegradski, minister of finance since 1887, not only continued Reutern's policy in developing the railway (14,900 mi. at the beginning, 24,000 mi. at the end of Alexander's reign) and in protecting industry (prohibitive tariff, 1891) but also tried to influence the foreign market and to stabilize the rate of exchange of the Russian ruble. He also resorted to foreign capital. In 1889–94 its influx was 5,300,000 rubles, as compared with 1,500,000 during 1851–88. However, the position of the Russian consumer, who had to pay about 34% ad valorem for imported goods, instead of 13% as before the tariff of 1891, was much worsened. The peasants especially suffered, as the price of grain, their only article for sale, fell from 1.19 rubles per *pud* (1881) to 0.59 in 1894, while their allotments, which had been insufficient at the moment of liberation, further diminished (1861–1900) to 54.2%. As a result, their arrears of taxes increased more than five times compared with 1871–80. Vyshnegradski tried to relieve the treasury by increasing enormously the customs and excise. In the decade 1883–92 taxation increased 29% while the population increased only 16%. Thus, elements of an agrarian crisis were increasing as the 19th century was nearing its end.

2. Foreign Policy.—Alexander III's foreign policy was peaceful. He wished to be his own foreign minister; Gorchakov gave place to a submissive Germanophile, N. K. Giers. Bismarck profited by this and, in spite of his alliance with Austria (1879), which was avowedly concluded against Russia, contrived to renew as early as 1881 the Dreikaiserbund of 1873. In 1884 it was renewed for three following years, and in 1887, as Austria seceded, Bismarck concluded his famous "reinsurance" treaty with Russia. All these treaties fettered Russia in its Balkan policy but secured the country against the opening of the Straits to England. As at the same time the Triple Alliance with Italy was concluded (1882), Bismarck's policy proved too complicated for his successor, Count Leo Caprivi, and in 1890 a Russian proposal to prolong the "reinsurance" treaty for the next six years was rejected. Thus the way was opened to a Franco-Russian *rapprochement* at a time when Germany was courting England, Russia's competitor in Asia (where Alexander in 1884 took Merv, thereby establishing Russia on the frontiers of Afghanistan). France opened to Russia its market for loans and its factories for armaments in 1889; a French squadron was enthusiastically received in Kronshtadt in 1891; and the subsequent *rapprochement* culminated in a military convention worked out in August 1892 and ratified by an exchange of letters in December 1893–January 1894.

Alexander III died at Livadia on Nov. 1 (N.S.; Oct. 20, O.S.), 1894.

(P. M.; M. T. F.)

G. Nicholas II

The death of Alexander III, like that of Nicholas I nearly 40 years earlier, aroused widespread hopes of a milder regime and of social reforms. Nicholas II (*q.v.*) had neither the imposing physical presence nor the strong will of his father. He had all the virtues of a father of a family and a country gentleman and would have had a happy and useful life as a private landowner. He had little taste for the splendours of monarchy and even less ability to handle the cumbrous, complex, and antiquated mechanism of Russian government. Unfortunately he had little aptitude for choosing good subordinates or delegating authority to them. His personal charm at first captured those who came into contact with him, but his tendency to change his mind, to agree with the last person he had been talking to, was the cause of many disappointments and won him a reputation for bad faith. His wife, Princess Alexandra (*q.v.*) of Hesse, a granddaughter of Queen Victoria, to whom he was utterly devoted, was of an imperious nature, with a much stronger will than the emperor's, and greatly influenced him.

1. Reassertion of Autocratic Principles.—Moderate liberal

CULVER PICTURES, INC.

NICHOLAS II, LAST OF THE RUSSIAN TSARS

opinion received an early rebuff when at a reception of *zemstva* delegates on Jan. 29 (N.S.; 17, O.S.), 1895, he denounced as "senseless dreams" any suggestion of "participation of *zemstva* representatives in internal government." On the contrary, he intended to defend the principles of autocracy "as unswervingly" as his late father had. Nicholas indeed, under the influence of Pobedonostsev, believed the maintenance of autocracy to be a sacred obligation toward God himself. This view was consistently supported by the empress, who, since her official conversion to Orthodoxy before marriage to Nicholas, had become a devoted believer in the doctrines of the Russian church. When in 1904 a male heir, Grand Duke Alexis, was born, the emperor felt that it was his duty to maintain the imperial heritage unimpaired—that is, with autocracy unchanged—for his son. The precarious health of the prince, who had inherited hemophilia through his mother, strengthened this conviction.

2. Administration and Economy.—During the first ten years of the reign, industrial progress continued rapidly, while agriculture lagged behind and the political system remained the same. The lack of any central direction of government, the absence of a prime minister, was more seriously felt under the weak Nicholas than under Alexander III. Uncoordinated by the emperor, the several departments of government pursued separate and even contradictory policies. The Ministry of Interior stood for paternalist principles. The improvement of agriculture and the protection of the peasants were its concern: no other authority must meddle. If the ministry was unwilling to introduce changes, nobody else must do so. The result of this mentality was that the *zemstva,* several of which had plans for valuable nonpolitical reforms that could be carried out by their own personnel locally, found themselves deprived of sufficient revenue, and their initiative obstructed, by the jealousy of the Ministry of Interior. The agricultural policy of the ministry was based on the maintenance of the village commune, which it regarded as a stronghold of peasant conservatism.

The Ministry of Finance, on the other hand, objected to the commune as a source of inefficiency, preventing the development of the initiative of the most enterprising farmers and consequent improvement of agricultural output. The Ministry of Finance in general supported individual business initiative in contrast to the Ministry of Interior's paternalism and old-fashioned collectivism. The Ministry of Finance may be said to have approximately reflected the aspirations of the rising Russian business class, the Interior those of the bureaucratic and landowning classes.

The most able minister of finance of this period was S. Yu. Witte (1892–1903). In his period of office, the metallurgical industry of the Ukraine made rapid progress. He was able to introduce the gold standard in 1897, and this proved an incentive for a substantial influx of foreign capital into Russian industry. In these years, too, the industrial working class grew rapidly. There were several big strikes in St. Petersburg in 1896 and 1897, and in the latter year Witte introduced a law imposing a maximum of 11½ hours work for all day workers and 10 hours for all engaged in night work. From 1899 to 1903 Russian industry suffered a depression, and unemployment grew. In these conditions the workers were unable to obtain further economic concessions from employers, but there were numerous short political strikes and street demonstrations, in some cases accompanied by violence.

3. Russification Policy.—The policy of russification of the non-Russian peoples of the empire, which had been a characteristic of the reign of Alexander III, continued. Nicholas II held anti-Semitic views and favoured the continued discrimination, in economic and cultural life, against the Jews. Russification of the German schools in the Baltic provinces continued, and the old university of Dorpat (Estonian Tartu), which had been closed in 1893, was reopened as the Russian university of Yuriev. In the central provinces of European Russia, Orthodox missionaries continued their efforts to compete with Muslim Tatar missionaries for the conversion of the small, still partly pagan, Finno-Ugrian peoples of this area.

In Armenia, an imperial decree of June 25 (N.S.), 1903, transferred to Russian administration the national fund of the Armenian Church, which was formed by the individual subscriptions of Armenian Christians and had been used for the social and educational needs of the Armenian community. By this action the government turned against itself quite gratuitously the most loyal of all the non-Russian peoples, whose hatred of Turkey had long bound it devotedly to the cause of the empire. The confiscation of the fund was followed by large-scale passive resistance by the Armenians, who boycotted the Russian law courts, schools, and administrative authorities.

Similar resistance was provoked in Finland by the military conscription law of 1898 and by the imperial manifesto of February 1899, which stated that imperial decrees should have precedence in Finland over Finnish laws, and thus threatened to reduce the Finnish diet to the status of a provincial assembly. The Finnish people as a whole met these actions with passive resistance, but terrorism was also used, and in June 1904 the Russian governor-general, Gen. N. I. Bobrikov, was murdered by a Finn, Eugene Shauman.

4. Resurgence of Revolutionary Activity.—Among the Russian people political opposition revived in the late 1890s. Its most visible expressions were student demonstrations, which were especially violent in 1899 and 1900, and in some of which factory workers joined. Cossacks charged the demonstrators, many were arrested, some were conscripted into the army (where they only spread their political ideas) or merely expelled from the university. Students inclined not only to revolutionary doctrines—whether Populist socialism or Marxism—but also to terrorism. The assassins of the minister of education, N. P. Bogolepov, in February 1901, and of the minister of interior, D. S. Sipyagin, in April 1902, were both students.

In March 1898 representatives of several illegal Marxist groups met in Minsk to found the Russian Social Democratic Workers' Party (R.S.D.W.P.). Its leaders, however, were almost immediately arrested by the police, and the Social Democratic movement took political shape among Russian exiles in Western Europe. At its second congress in 1903, held partly in Brussels and partly in London, appeared the rift between the followers of V. I. Ulyanov (Lenin) and the rest. Lenin maintained that the party should be confined to full-time "professional revolutionaries," while Y. O. Tsederbaum (Martov) and others preferred as their aim a mass working-class party, without stringent conditions for membership, similar to the German or other Western European socialist parties. Lenin took for his faction the name Bolshevik (derived from *bolshinstvo,* "majority"), because it had won a majority in the election of the party's key bodies. His opponents became known as Mensheviks (*menshinstvo,* "minority"). In fact, in the following decade the factions within the movement were extremely fluid, and no single group for any length of time had clear majority support among the party membership.

The various Populist illegal groups in Russia also made efforts to unite, and at a conference held in 1902 in Switzerland they formed a Party of Socialist Revolutionaries (S.R.'s). This party's leadership, like that of the Social Democrats, came principally from the intelligentsia. Its aim was to appeal above all to the peasants, whereas the Social Democrats laid the main emphasis on the industrial working class. In practice it was hard to establish contact with peasants, because of their scattered distribution and the comparative ease with which the police could observe the entry of strangers into villages. Consequently the S.R.'s no less than the Social Democrats found their mass support in the cities. Neither party had a monopoly of proletarian support.

5. Other Political Movements.—Russian liberalism also became organized in this period. Two trends may be roughly distinguished—a cautious, limited constitutionalism favoured mainly by enlightened conservatives among the landed gentry and officers of the *zemstva*, and a radical liberalism which insisted on full parliamentary and responsible government and drew its support mainly from the urban professional classes. The second trend, forming a secret Union of Liberation, expressed its views in the weekly paper *Osvobozhdenie* ("Liberation"), published in Germany and edited by the former Marxist P. B. Struve.

Political parties also appeared among the non-Russian nationalities. Estonian, Latvian, and Lithuanian nationalist movements took form, led by middle-class professional people and supported by peasants. In Poland there were two main parties, the National Democratic Party, which stood for moderate democracy, and the Polish Socialist Party. Both wished self-government for Poland, and independence if possible. But the extremist "Social Democracy of Poland and Lithuania" bitterly opposed all Polish nationalism and aimed at a single socialist republic for the whole territory of the Russian Empire. In the Ukraine, the first political party to take the view that there was a separate Ukrainian nation, and to claim autonomy for it, was the Revolutionary Ukrainian Party, founded in 1901. It split soon into socialist, radical, and conservative nationalist sections. Both the Polish and the Ukrainian movements received help from their kinsmen in Austrian Galicia. Among Russian Jews, the main trends in these years were on the one hand various forms of socialism, on the other the new international movement of Zionism. In Armenia the Dashnak (national socialist) Party resembled, in ideas and methods, the Russian S.R.'s. In Georgia by far the strongest group was social democracy, of the Menshevik branch. Finally, among the Muslims of Russia a democratic movement was growing, in favour of secularism, modernization, emancipation of women, and political liberty. Its main centre was Kazan, its social leadership came from Tatar merchants and school teachers.

6. Foreign Policy and the Russo-Japanese War.—Russian foreign policy in the 1890s was concerned above all with the Far East. The inability of Nicholas II to decide between contradictory policies urged by different advisers was a major factor in the drift toward war with Japan. Russia refused to make a bargain with Japan, leaving it Korea in return for Russian dominance in northern Manchuria, or even in all Manchuria. By insisting on having all Manchuria and all Korea, it forced Japan first to ally itself with Britain and then to go to war with Russia. (*See* RUSSO-JAPANESE WAR.) The war brought a series of defeats to Russia, culminating in the destruction of the Baltic Fleet in the Straits of Tsushima in May 1905. It was fortunate for Russia that Japan too was exhausted by its efforts, so that peace could be concluded at Portsmouth, N.H., on fairly favourable terms. Russia abandoned all claims to Korea and surrendered Port Arthur and the South Manchurian Railway, but was able to retain its position in northern Manchuria and its control of the Chinese Eastern Railway, so essential for communication between Siberia and Vladivostok. Russia also kept the northern half of Sakhalin and did not have to pay an indemnity.

7. Revolution of 1905 and the First and Second Dumas.—Defeat by Japan brought revolution in Russia. On Sunday, Jan. 22 (N.S.; 9, O.S.), 1905, about 1,000 workers were killed when police fired on a peaceful demonstration in front of the Winter Palace in St. Petersburg. During the spring and summer the *zemstvo* constitutionalists became more outspoken in their political demands, strikes increased, and there were agrarian riots in many provinces. At the end of October a general strike, more political than economic, paralyzed the communications system of the empire. Delegates of strike committees in St. Petersburg formed a *soviet* ("council") of workers' deputies, which for a time looked as if it might develop into a revolutionary government of Russia. With extreme reluctance, Nicholas II agreed to issue a manifesto to the people on Oct. 30 (N.S.; 17, O.S.). Drafted by Witte, it promised to set up an elected legislature (*duma*) and to grant political and civil liberties. The emperor also instituted a Council of Ministers, with a president (the equivalent of a prime minister), and entrusted this office to Witte.

This was much less than the constituent assembly which the liberation movement had demanded. But the liberals, frightened by the scope of the revolution, decided to operate the new system, while the Marxists and Populists decided to boycott it. In the election to the First Duma the largest number of votes went to the Constitutional Democrats (*Kadets*), as the liberals of the Union of Liberation now called themselves. The second most numerous group in the Duma were the Labour group (*Trudoviki*), persons of Populist outlook who had stood for election though the S.R. party had officially boycotted the election. The Social Democrats had also boycotted the election except in Georgia, where they swept the board.

The left-wing majority of the First Duma naturally wished to pass a mass of radical legislation. In particular, it wished to divide up the large landed estates among the peasants (subject to compensation); to ensure equal civic rights for Jews, dissenters, members of religious sects, and minorities; and to grant a complete amnesty to all political prisoners. The emperor would not consider such things. In May, before the duma met, he dismissed Witte and appointed as minister of interior a former provincial governor who had impressed him by his firmness of character, P. A. Stolypin. In July 1906 he made Stolypin prime minister, and on July 22 (N.S.) dissolved the duma. During the summer he restored order by ruthless measures. But instead of introducing permanent dictatorial government, the emperor and Stolypin decided to hold elections for a Second Duma.

The extreme left parties—Social Democrats and Socialist Revolutionaries—now took part and won 118 seats out of 520 (*see* DUMA). The Trudoviki saw their numbers slightly reduced, from 101 in the First Duma to 98; the Kadets declined from 179 to 99; and the parties of the right increased their representation from 43 to 94. The Second Duma was thus more radical than the First. Cooperation between it and the government remained impossible. It met on March 5 (N.S.), 1907, but was dissolved on June 16. At the same time (though under the manifesto of Oct. 30 the electoral rules could be changed only with the consent of the Duma) a new electoral law was issued by decree, which greatly restricted the franchise. It was especially designed to strengthen the representation of the propertied classes in town and country and to reduce greatly the representation of the non-Russian nationalities. In the Third and Fourth Dumas, elected under this law in the autumn of 1907 and 1912, the parties of the right and the centre (the Octobrist Party of conservative constitutionalists, derived from the right wing of the former *zemstvo* liberals) predominated, and the Kadets, the socialists, and the non-Russians, together, shared only about a quarter of the seats.

8. Stolypin's Regime.—Democracy had been defeated, but the post-1907 system, usually associated with the name of Stolypin, was greatly different from the autocratic system of the years before 1905. Government was at least made more efficient with the creation of a prime minister and a Council of Ministers, though this advantage was of less importance after the murder of Stolypin in September 1911. The dumas, for all their restricted franchise and limited powers, were at least a forum in which virtually all political opinions could be expressed. Political parties and other types of associations could be legally formed. Trade unions were permitted, though strikes were still forbidden. The press was now comparatively free, and censorship of literature was virtually ended. After the grave economic losses of war and revolution, the economy recovered from 1908 onward and rapid industrial progress was made.

Agricultural Reform.—Stolypin's main interest was agricultural reform, which he hoped to achieve by a series of measures passed between 1906 and 1911, designed to encourage individual peasant ownership at the expense of the village commune. From the economic point of view, these were certainly progressive measures, for they put a premium on enterprise and removed the main factor perpetuating inefficiency. On the other hand they benefited only the enterprising minority among the peasants. As for the peasant masses, those who could not escape to employment in the growing industry were doomed to a prospect of increasing poverty,

constantly accentuated by the relentless growth of rural population. Moreover, Stolypin's refusal to consider the compulsory partition of landowners' estates among the peasants ruled out policies which, though they might not have contributed to economic progress, would certainly have pleased not only the peasant masses but democratic opinion in general.

Russian Nationalism.—Perhaps the most serious fault of the policies of Stolypin was a deliberate revival of Russian nationalism and russification. In 1905 the nationalities had made certain gains, not only by representation in the first two dumas but also in the creation of cultural organizations controlled by themselves, such as the Polish Macierz Szkolna (Mother of Schools) or the Ukrainian organization Prosvita (Enlightenment). These were destroyed, or reduced to inactivity, after 1907. Special hostility was shown to all forms of Ukrainian nationalism and to the Tatar democrats and modernists, who in August 1905 had created a new party, the All-Russian Muslim League. In the Baltic provinces, however, the government treated the Germans more kindly after 1905, because it had been frightened by the violence of the Latvian peasants and workers in the revolutionary months, and now saw in the German landowners and burghers an element of stability.

Russian nationalism was in fact the official ideology of the Stolypin era, and this had its relevance to the new interest shown by the Russian government in Balkan affairs. This is, of course, not to say that Russia was more guilty than Austria-Hungary in the series of Balkan crises which led from 1908 to the outbreak of war in 1914, but only that Russia made its contribution to the tragedy.

9. World War I.—From Dec. 31 (N.S.), 1893, Russia had a defensive alliance with France. In 1904 France and Great Britain put an end to their overseas rivalries. This Entente Cordiale was followed on Sept. 13 (N.S.), 1907, by an agreement between Great Britain and Russia delimiting their mutual spheres of interest in Persia, Afghanistan, and Tibet. Thus the Triple Entente was born. By entering World War I, Russia kept the word given to its allies and partners.

Despite some reforms in the preceding decade, the Russian Army in 1914 was ill-equipped to fight a major war, and neither the political nor the military leadership was up to the standard required. Nevertheless the army fought bravely, and both soldiers and junior officers showed remarkable qualities. The Russian invasion of East Prussia in August 1914 was defeated by Paul von Hindenburg and Erich Ludendorff at Tannenberg, but it required the Germans to send reinforcements from the Western Front and so saved France from defeat and made possible the victory of the Marne. The campaigns of 1915 and 1916 brought terrible casualties to the Russian forces, which at times did not even have sufficient rifles. But as late as July 1916 the Russian Army was capable of making a successful offensive under Gen. A. A. Brusilov in Volhynia and Bukovina. (*See* also WORLD WAR I.)

The Russian people did not respond to the war with real enthusiasm. The government could not overcome its traditional distrust of any public initiative, even in the organization of medical supplies or munitions for the forces. In the Fourth Duma a majority of the centre and moderate right formed a Progressive bloc and proposed the formation of a national coalition government "possessing the confidence of the country" and a program of reforms which could be carried out even in wartime. The emperor rejected the proposal and prorogued the Duma, on Sept. 16 (N.S.), 1915. Eleven days earlier the emperor decided to assume personal command of the armies in the field. The result was that in Petrograd (as the capital had been renamed at the beginning of the war, in place of its old German-sounding name) the empress was in fact in command. She herself was under the influence of the adventurer and self-styled "holy man" G. E. Rasputin (*q.v.*), whose hold over her was due to his ability to arrest the bleeding of the hemophilic tsarevich, Alexis. Thus to the massive casualties at the front, the retreat of the armies, and the growing economic hardships was added the knowledge, widespread in the capital and among the upper classes, that the government of the country was in the hands of incompetents. Rumours of treason in high places were widely believed, though the historical evidence does not suggest that they were true. On the night of Dec. 30–31 (N.S.), 1916, Rasputin was murdered. But the system was beyond salvation. There was in fact no hand at the helm, and the ship was drifting onto the rocks.

10. The End of the Romanov Dynasty.—The collapse came suddenly on March 8 (N.S.), 1917, planned by no one. A number of factories in Petrograd were on strike, and many of their workers were on the streets, as were the women in shopping queues and other women celebrating the international socialist anniversary of Women's Day. These crowds turned into demonstrations, and the demonstrations took over large areas of the capital. The workers came out in the streets with political slogans: "Down with Autocracy!" and "Down with War!" Two days later the emperor ordered the military governor to fire on the demonstrators, but the soldiers refused to use their rifles, and unit after unit went over to the workers. The police and gendarmes did shoot, and street fighting took place. Meanwhile the Duma, which had been prorogued, refused to disperse. A Petrograd Soviet of Workers' and Soldiers' Deputies was elected, like that of 1905. On March 14 the Duma, which had previously set up a standing committee, formed a provisional government, headed by Prince G. E. Lvov and mainly composed of leaders of the Kadet and Octobrist parties. On the next day a deputation visited the emperor at his headquarters in Pskov and accepted his abdication on behalf of himself and his son. When his brother, Grand Duke Michael, refused the throne, the Romanov dynasty came to an end. (G. H. N. S.-W.)

RUSSIAN LANGUAGE. The Russian language has about 136,000,000 speakers, a majority of the population of the Soviet Union, of which it is the chief administrative language. It is sometimes called Great Russian to distinguish it from the closely related Belorussian, or White Russian, and "Little Russian" (an obsolescent term), or Ukrainian (*see* UKRAINIAN LANGUAGE), with which it makes up the eastern branch of the Slavic languages (*q.v.*).

History.—The Slavonic books translated by Saints Cyril and Methodius and their disciples (*see* CYRIL AND METHODIUS, SAINTS) and disseminated among the West and South Slavs in the 9th century must have found their way to the East Slavs quickly. Russian chronicles preserve in later copies treaties made by Kievan princes with Byzantium in 911, 944, and 971, but it was not until after the official baptism of Prince Vladimir in 988 that schools were opened and writing began to flourish. The chronicles mention intensive cultural activity under Yaroslav the Wise (1019–54), and the oldest surviving dated manuscript, the opulent Ostromir Gospel of 1056, was quickly followed by a number of other texts which testify to a high cultural level. Epigraphical materials, including graffiti and inscribed objects (whorls, bricks, jars), demonstrate a general knowledge of writing at the same epoch. In 1951 archaeologists working in the ancient north Russian city of Novgorod unearthed a hitherto unknown type of source—short texts, mostly private letters and agreements, written on birchbark. Several score *gramoty* of this type came to light, the oldest from the late 11th century; their importance for the history of language and culture is comparable with that of papyri for the classical studies.

The overwhelming majority of the writing represents Church Slavonic (Ch.Sl.) of the Russian recension; that is, a standardized written language based on a South Slavic type of speech but adapted to local conditions. This is the language of the church and the culture connected with it, and the texts are mostly translations from the Greek. The Ch.Sl., although differing in many particulars from the local speech, was probably readily comprehensible to the East Slavs in the early centuries and not difficult for them to master. Present knowledge of the everyday language comes chiefly from the scanty birchbark *gramoty* and from the occasional slips made by scribes who undertook to add notes or colophons in the Ch.Sl. manuscripts they were copying. Original compositions such as the chronicles and law codes survive in later copies in which it is not easy to distinguish older and newer linguistic habits. It seems, however, that the business language of the laws and letters used more of the East Slavic elements, particularly in vocabulary, than did annalistic and hagiographic works which had some literary pretensions. This is a common phenomenon; different genres are usually couched in different linguistic styles and it is natural that everyday matters are treated in everyday terms. The annalists made skilful stylistic use of the various linguistic elements; the contentions of Soviet critics that there were two different written languages, the foreign ecclesiastical Ch.Sl. and the vernacular secular Russian, are clearly exaggerated.

A number of the earliest texts exhibit some evidence of a difference between a northern and a southern dialect, but on the whole the language until the 13th century is best described as Old East Slavic. The conventional term Old Russian, which is too firmly established to be discarded, is to be understood as referring to the language of Rus, the whole East Slavic area, and not to the modern national group called Russians. Specifically southern dialect features warrant the identification of some texts from the late 13th century as Ukrainian, but it was not until the 16th and 17th centuries that Belorussian became clearly defined.

The use of local business languages for practical purposes in different areas long had no effect on the preeminence of Ch.Sl., which remained a unifying literary language for centuries. In the early period it had adopted consistently a number of East Slavic features, but during the 14th century it was reformed as a result of the prestige of Bulgarian and Serbian scholars who fled to Russia when the Turks overran the Balkans. This "second South Slavic influence" (which also affected literary style, art, and architecture) was decisive in establishing an archaic and partially foreign type of spelling and grammar as the only suitable vehicle for literary composition. Not until the 17th century, a time of turmoil and incipient change in all realms of Russian life, did this authority weaken. The business language of the Moscow chancelleries, which had steadily gained influence with the growth of the political power of the Muscovite state, then began to be used in more and more significant works, like the Code (*Ulozhenie*) of 1649, which was particularly important for the development of a linguistic standard because it was one of the first printed secular books. At the same time the beginnings of a style intermediate between Ch.Sl. and business usage can be discerned, and some texts in real colloquial Russian appeared (especially the autobiography of the dissident priest Avvakum Petrovich, 1673).

The radically westernizing policies of Peter I (reigned 1682–1725) and his successors made necessary new means of expression. At first the effort to catch up with Europe was manifested by a flood of translations, chiefly of practical works. Foreign words were introduced into Russian almost indiscriminately, despite the efforts of such talented writers as V. Trediakovski (d. 1769) who preferred to create new words from Russian and Slavonic materials. Persistence of the traditional view that the vernacular was not suited for literature clashed with a recognition of the fact that Ch.Sl. was too foreign a vehicle for the new culture. The problems were most clearly posed by the brilliant scientist and writer Mikhail Lomonosov (d. 1765), who distinguished three styles: a predominantly Ch.Sl. type was to serve for the most "elevated" literature (ode, tragedy), strictly colloquial Russian for the "low" genres (fable, comedy), and an intermediate type for other writings. His suggestions were largely followed, at least in principle, but there was a steady process of rejecting the most unfamiliar and archaic words and constructions of Slavonic and constant imitation of French and German models. About the beginning of the 19th century journalists and educators had elaborated a flexible intermediate style in writing about science and practical affairs; an exemplary moderate form of high style was used by N. Karamzin in his *History of the Russian State* (published 1816–29); and hitherto despised colloquial elements were made respectable by the comedies of D. I. Fonvisin (especially *The Minor*, 1782) and the fables of I. A. Krylov. But there was still an appreciable distance between the different types of language, and influential voices were still to be heard vigorously insisting on a Slavonic purism. It remained for the poet Aleksandr Pushkin (*q.v.*) to achieve a final synthesis.

Pushkin's poetry ranged from playful romance to the serious epic, from Byronic narratives to classical epigrams, from imitations of folk songs and fairy tales to poignantly personal lyrics and high tragedy. In prose he wrote history, literary criticism, travel accounts, stories, and novels. Whatever the genre, Pushkin's language remained throughout essentially the spoken Russian of an educated man, flavoured by pungent peasant proverbs or elegant allusions to French classics, by solemn Slavonic phrases or official chancellery clichés as demanded by the subject matter and tone of his approach. The brilliant success of Pushkin's works put an end to the linguistic controversy, and the history of the Russian literary language subsequently is an account of the refinement of details, of the extension of special types of vocabulary, and of the elaboration of special styles in keeping with changing literary fashions. (*See* also RUSSIAN LITERATURE.)

Dialect Forms.—In modern times three groups of Russian dialects are distinguished: the northern, which stretches from Leningrad all across Siberia; the southern, including most of central and southern Russia; and a central group occupying a relatively narrow band between the other two. There is no clear boundary between Russian and Belorussian or between the latter and Ukrainian, for the major dialect types are everywhere united by zones of transition. It is only in the east, where relatively recent settlers brought Ukrainian from the south and Russian from the north, that there is a fairly distinct linguistic frontier. Viewed historically, it seems that in the Old Russian period the chain of dialects from south to north represented closely related types, with a broad intermediate area separating the extreme north from the extreme south. The southernmost dialects soon (13th–14th centuries) became sufficiently differentiated to be identified as Ukrainian, while the central belt, first developing along the same general lines as the north, gradually split into an eastern and a western sector. The central west, though maintaining some close contacts with Ukrainian, established its identity as Belorussian (16th–17th centuries), while the central east eventually became southern Great Russian.

Great Russian dialects differ from one another in an enormous number of details, and yet they have retained an overall structural similarity which makes them on the whole mutually comprehensible. A major difference between the northern and southern (and also Belorussian) types is in vocalism; the northern (called *o*-dialects) have on the whole maintained all vowel distinctions regardless of position, while in the southern (called *a*-dialects, with *akanie*), unstressed vowels have changed quality; *o* > *a*, and often there are complex further changes. This *akanie* is reliably attested from the 14th century. The oldest northern texts have a confusion of the letters *č* and *c*, reflecting a typical feature of the north, where there is no functional difference between the two sounds. Ukrainian, Belorussian, and south Russian have a fricative *γ* (velar) or *h* (laryngeal) for Common Slavic and northern *g;* this doubtless is a prehistoric change.

The basis of standard Russian is the dialect of Moscow, the cultural centre from the 15th century. The city was originally within the northern dialect zone, but as the mutual influences between north and south created a growing central dialect type, Moscow found itself in the central zone. Thus it has on the whole the consonants of the north (though keeping separate *č* and *c*) and the vowels of the south. The word for "mountain," spelled *gora*

and so pronounced in the north, is *gará* in standard pronunciation and *γará* to the south.

Russian and Belorussian Phonology and Morphology.—For some E.Sl. characteristics see SLAVIC LANGUAGES. In the oldest texts some common E.Sl. features already appear: *č ž* < C.Sl. **tj *dj; l* < **tl *dl; u* < **ǫ; a* < **ę*. The extra vowel developed in words like *zóloto* "gold" < **zolto* (O.Ch.S. *zlato*) and *molokó* "milk" < **melko* (O.Ch.S. *mlěko*), initial *o-* for *je-* (R. *ózero* "lake" < **jezero*), and initial *u-* < **ju-* (OR. *ugŭ* "south" has been displaced by the Ch.Sl. form *jug*). In the early historical period the reduced vowels *ŭ ĭ* were lost in "weak position" and became *o e* in "strong position." C.S. *ě* merged with *e* in R. and BR., but became *i* in Ukr. All E.Sl. languages oppose a series of palatalized consonants to plain (or labialized) corresponding series, although the details vary from language to language. BR. has no palatalized labials before *j* or in final position (R. *s'em'* "seven," *p'ju* "I drink," BR. *s'em, pju*), no soft *r* (R. *kur'ú* "I smoke," BR. *kurú*), and soft *t'* and *d'* have become affricates *c'* and *dz'* (R. *d'ét'i* "children," BR. *dz'ec'i*).

Belorussian, spoken by about 7,000,000 persons, has two major dialect groups, northeast and southwest. Since Minsk, the capital, is on the latter's territory, the modern literary language, essentially a creation of the Soviet period, is southeastern in character.

A great many variations in phonology and morphology are still permitted, however, for usage has not yet been stabilized. BR. uses a strictly phonetic system of spelling which makes it look a great deal more different from R. than it sounds when spoken.

(H. G. L.)

RUSSIAN LITERATURE. The term Russian literature is used to describe the literature of different areas at different periods. Thus, from the beginning of written literature in the 11th century to the 16th century, it describes the literature of Kievan Russia—*i.e.*, the loose confederation of East Slav tribes ruled by the dynasty descended from Rurik (*see* RUSSIAN HISTORY: *Kiev*); from the 16th to the early 20th century, that of unified Russia, but not of other parts of the Russian Empire; and from 1917, that of the Russian Soviet Federated Soviet Republic, but not of the other republics constituting the U.S.S.R. For the literature of the Russian Empire other than Russia itself, and of other parts of the U.S.S.R., *see* ARMENIAN LITERATURE; GEORGIAN LITERATURE; LATVIAN LITERATURE; LITHUANIAN LITERATURE; UKRAINIAN LITERATURE. For the literature of Russian Jewry, *see* HEBREW LITERATURE; YIDDISH LITERATURE. *See* also DRAMA; THEATRE; NOVEL; SHORT STORY.

Division into Periods.—Russian literature is generally divided into two main periods: the Old Russian period, from the 11th to the end of the 17th century; and the modern period, which is subdivided into Pre-Revolutionary, from the end of the 17th century to 1917; and Post-Revolutionary, from 1917. The literature of the first period (which some historians date as ending in the mid-17th century) corresponds roughly to the medieval literature of Western European countries. It was dominated at first by Kievan Rus; but during the Tatar Mongol invasion in the 13th century, regional literatures gained in importance; and from the late 15th and early 16th centuries, the main literary centre was Moscow.

During the whole of this Old Russian period, literature was influenced by the connections between Russia and Byzantium, and between literature and the Orthodox Church, which began with the conversion to Eastern Christianity of St. Vladimir (*q.v.*), grand duke of Kiev, in 988. But in this period the influence of earlier East Slav oral folk poetry was also felt.

The beginnings of modern literature are marked by growing westernization, already noticeable in the 17th century, and increased by the reforms of Peter I the Great. From the beginning of the 18th to the early 20th century, Western influence was predominant, especially that of France. English influence also made itself felt, *e.g.*, in the foundation of periodicals (mid-18th century) and the rise of the sentimental school. The greatest period of Russian literature from the point of view of Western Europe, and the one which has had most influence on world literature, is the 19th century.

The Revolution of 1917 is a landmark. Post-Revolutionary literature, although developing from foundations laid in the Old Russian and Pre-Revolutionary periods, shows tendencies to some extent related to political circumstances and to the close supervision exercised by the Communist Party on all aspects of life and culture. This period is marked by a developing struggle between creative artists and the state, which, after Stalin's death in 1953, seemed to be resulting in renewed contact with Western literatures, and some degree of freedom for writers.

For the historical background to the development of Russian literature, which has always been closely connected with national and political policies, *see* RUSSIAN HISTORY. *See* also articles on many of the writers mentioned in this article.

This article is divided into the following main sections:

I. Old Russian Literature
  1. The Kievan Period
  2. Development of Regional Literatures
  3. Literature of Unified Russia
II. Modern Pre-Revolutionary Literature
  A. The 18th Century
    1. 1690–1730
    2. 1730–1750
    3. 1750–1775
    4. 1775–1790
    5. The 1790s
  B. The 19th Century
    1. Poetry
    2. Drama
    3. Prose
  C. Early 20th Century
    1. Symbolism
    2. Futurism
III. Post-Revolutionary Literature
  1. Early Years (1917–1928)
  2. Five-Year-Plan Literature (1928–1934)
  3. Socialist Realism (1934–1941)
  4. War Literature (1941–1945)
  5. Zhdanovism (1945–1953)
  6. The Thaw (1953 and After)

I. OLD RUSSIAN LITERATURE

The earliest works of Old Russian literature date from the third decade of the 11th century. Since the development of literature was connected from the first with the acceptance of Christianity by St. Vladimir in 988 and the country's Christianization, Old Russian literature was primarily religious and didactic in content and form. Didactic works were influenced by Byzantine literature in translations from the Greek, some coming to Russia from Bulgaria, and some organized and translated, as early as the reign

of Yaroslav the Wise (1019–54), on Russian soil. Secular literature was influenced by oral folk poetry, which had existed among the East Slavs long before Russia had a written literature. There is no indisputable evidence of this oral poetry, since the first records of folk literature were made in the 17th century; but indirect information can be gleaned from written sources. The most valuable heritage of old Russian folklore is the epic or heroic folk song, the *bylina*. These were already being composed in the 10th century; they later ranged widely in theme and subject. They were produced in Kiev, Novgorod, and the principality of Galicia.

1. The Kievan Period.—The first phase of Old Russian literature, from the 11th to the early 13th century, is associated with Kievan Rus, and is called the Kievan period, or sometimes, because of the Tatar Mongol invasion that followed it, the pre-Mongol period.

The chief concentration of literary activity was in southern Russia, mainly in Kiev; although isolated works were written in other towns in the south (Chernigov, Turov, Galich) and in the north (Novgorod, Smolensk, Rostov). The language of both northern and southern writers was basically the same—the old literary language of the East Slavs, which had absorbed to a greater or lesser extent elements of Old Church Slavonic (*q.v.; see* also RUSSIAN LANGUAGE; BULGARIAN LANGUAGE). Consequently, the literature of the Kievan period can be regarded as being shared by Great Russians, Ukrainians, and White Russians.

The literature of the Kievan period possessed from the first many translations, mainly from Greek but some also from Latin. Among them were service books, mostly in Old Bulgarian, which included prayers and chants. The earliest surviving dated example is the Novgorod "Service Minei," a monthly service book of 1095–97 (for September, October, and November), of which there is a late 11th-century copy. At about the same time several kinds of biblical books appeared, among them "Aprakos" Gospels, in which readings from the Gospels were arranged by days of the week as part of the church service; the Gospels in the biblical arrangement; various arrangements of the Psalter; and the so-called *Pariminik,* Old Testament passages arranged to fit the church services. The earliest surviving manuscript of an "Aprakos" Gospel is the so-called *Ostromir Gospel,* copied in 1056–57 by Deacon Gregory for Ostromir, mayor of Novgorod; and the oldest known manuscript of the Four Gospels is the *Galician Gospel* (1144). Other translated works included apocryphal literature; saints' lives; the works of the Church Fathers; books about the creation of the world: *e.g., Shestodnev* ("The Six Days"); such popular works as the *Physiologus* (*Fiziolog; see* BESTIARY); chronicles by John Malalas, Georgius Hamartolos, George the Syncellus, and others; part-secular, part-religious works, such as *Istoria Iudeiskoi voiny* (*De bello Judaico,* by Josephus, *q.v.*); the *Alexandria,* a translation of a version of the Alexander romance (*q.v.*); versions of the Troy legend such as the *Troyanskie deyanie;* a translation of the Byzantine romances *Devgenievo deyanie* ("The Adventures of Digenis Akritas"), the *Povest o premudrom Akire* ("The Tale of Akir the Wise"), and the *Povest o Varlaame i Iosafe* ("The Tale of Barlaam and Josaphat"). (*See* also GREEK LITERATURE: *Byzantine.*)

One of the oldest literary genres, widely developed in Old Rus, was the chronicle. As early as the mid-11th century, compilations of chronicles were beginning to be made, and by the early 12th century a compilation of outstanding historical and literary significance was taking definite shape. This was the *Povest vremennykh let* ("The Tale of Bygone Years"; translated as *The Russian Primary Chronicle,* 1930), the first version of which was compiled *c.* 1112, probably by Nestor (*q.v.*), a monk of the Kiev-Crypt Monastery. Under the year 1096 the *Pouchenie Vladimira Monomakha* ("Testament of Vladimir Monomakh"), addressed to his children, and supplemented with an autobiography of this outstanding political figure, was inserted into a copy of the *Primary Chronicle* known as the Laurentian text (1377).

Sermons occupy an important place in the literature of the Kievan period, the best example being the *Slovo o zakone i blagodati* ("The Discourse on Law and Grace") by Hilarion, written between 1037 and 1050, before his appointment as the first Russian Metropolitan in 1051. Permeated with ardent patriotism, it is a work of great oratorical skill, equaling the supreme examples of Byzantine ecclesiastical rhetoric. In the 12th century, the second Russian Metropolitan, Kliment Smolyatich (Clement of Smolensk), and, in particular, Kiril (Cyril), bishop of Turov, were outstanding exponents of the art of ecclesiastical oratory in Kievan Rus. Kiril also wrote 30 prayers and 3 kanons.

FIFTEENTH-CENTURY MANUSCRIPT OF THE EARLIEST RUSSIAN CHRONICLE, "THE TALE OF BYGONE YEARS," ORIGINALLY COMPILED ABOUT 1112. ILLUMINATION SHOWS PUNISHMENT AND EXECUTION OF THE LEADERS OF AN ANTI-CHRISTIAN UPRISING, 1071

Of early hagiographical works the anonymous *Skazanie* ("Legend"; late 11th or early 12th century) of the princes Boris and Gleb, the sons of St. Vladimir, merits particular attention. In form it resembles the historical legend rather than the traditional Byzantine saint's life; and it is full of lyrical laments, monologues, prayers, and meditations. It was written in support of the policies of Yaroslav the Wise.

In the first quarter of the 13th century a work was written which later (early 15th century) was called the *Kievo-Pecherski Paterik* ("The Paterikon of the Kiev-Crypt Monastery"). It is based on correspondence between Simon, bishop of Vladimir, a former monk of the Kiev-Crypt Monastery, and Polycarp, a monk at the monastery. It includes stories of the founding of the monastery (mid-11th century), and episodes from the lives of its monks. The literature of pilgrimage to the Holy Land originated in Kievan Rus. The most noteworthy work of this kind is the *Khozhdenie* ("Pilgrimage") to Palestine in 1106–08 of Daniel, prior of a southern Russian monastery. This combines topographical description with legend, and shows poetic feeling.

The most outstanding work of Kievan Russia is the *Slovo o Polku Igoreve* ("The Lay of Igor's Host," or "Tale of Igor's Expedition"; English translation from the Old Russian, by D. Ward, 1958), an account of the unsuccessful campaign in 1185 by Prince Igor of Novgorod-Seversk and the princes allied with him against the Polovtsians. It contains an appeal to the Russian princes for unity against the nomads of the steppes who were devastating the Russian land. It was written between 1185 and 1187, and preserved in a single manuscript, which was discovered in 1795 by the antiquarian, Count A. I. Musin-Pushkin, published in 1800, and lost during Napoleon's invasion of Russia in 1812. Deeply patriotic in spirit and remarkable for its literary mastery, the "Lay" ranks as an outstanding medieval epic. Its author, perhaps a member of the retinue of Prince Svyatoslav of Kiev, skillfully exploited the wealth of Russian folk poetry and contemporary written literature.

2. Development of Regional Literatures.—During its brief existence Kievan Rus created a literature distinguished for both artistry and ideas, and showing great possibility of development. However, from the mid-12th century a gradual decline of Kievan Rus set in, accentuated in the 13th century by the Tatar Mongol invasion; and there was a marked falling-off of literary activity. The traditions of the Kievan period were to some extent taken up in northeastern Russia and in the principality of Galicia-Volynia, where a lively propagandist pamphlet, *Molenie Daniila zatochnika* ("The Supplication [Epistle, Discourse] of Daniel the Exile"), was written in the first quarter of the 13th century in the region of Pereslavl near Suzdal. It is permeated with hostility toward the boyars and the monastic clergy, and calls for a strengthening of the power of the princes as a protection for the weak, and for the patronage of sages and men of letters.

The Tatar invasion was reflected as a great disaster in a number of 13th-century works. As literature, the most noteworthy is the *Povest o razorenii Batyem Ryazani* ("The Story of the Destruction of Ryazan by Batu Khan"), based on epic tales and historical songs about the devastating attacks of the Tatars on the principality of Ryazan in 1237. The eloquent, fiery sermons of Serapion, archimandrite of the Kiev-Crypt Monastery, written in the last year of his life (he died in 1275), are full of grief at the Tatar invasion. The Tatar onslaught of 1237 inspired the *Slovo o pogibeli russkoi zemli* ("Discourse on the Ruin of the Land of Rus"), which has survived only in a defective copy. It contains a vivid description of the beauty, wealth, and strength of the Russian land before the invasion. At the end of the 13th or in the early 14th century a life of Prince Aleksandr Nevski was written, probably by an ecclesiastic from the principality of Galicia, and perhaps on the basis of a secular biography which has not survived. This work is written in the traditional form of a hagiography but is closely akin to a war narrative; it is dominated by the epic figure of Aleksandr, presented both as an ideal general in war, and as a political figure, as reflected in his struggle with the Swedish and German conquerors and his diplomatic relations with the Tatars. An outstanding literary work of 13th-century southern Russia is the "Galich-Volynsk Chronicle," describing events from 1201 to 1292, which forms part of the copy of a compilation of chronicles called the Hypatian collection, written in the 1420s, and including also a copy of the *Primary Chronicle.*

The regional character of Russian literature, already fairly clearly marked in the 13th century, resulted from increased lack of communication between the territories of Russia, and was still apparent in the 14th and 15th centuries. Comparatively few literary works have survived from the 14th century because of the oppressiveness of the Tatar yoke. But by the beginning of the 15th century the literature of Moscow began to predominate, for Moscow had, from the mid-14th century, played the part of a unifying centre for Great Russian nationalism. Tendencies toward unification are particularly clear in the tales of *Mamaevo poboishche* ("The Rout of Mamay"), composed at the end of the 14th and the beginning of the 15th century about the Battle of Kulikovo (1380), at which the Tatars were defeated by a group of princes led by the Muscovite Prince Dmitri Ivanovich. Outstanding among them is the *Zadonshchina,* strongly influenced by "The Lay of Igor's Host." The conquest of Constantinople by the Turks in 1453 inspired Nestor Iskander's *Povest o Tsargrade* ("Tale of the Taking of Tsargrad," *i.e.,* Constantinople), which is mainly written in the style of the traditional war narrative. In it Russia is portrayed as the successor to Byzantium and the defender of the Orthodox faith. In the late 15th and early 16th centuries other stories were written in Moscow on the theme of Russia's political succession to the inheritance of Byzantium. Among them are stories about the Babylonian Empire, and their natural sequel, the *Skazanie o Knyazyakh Vladimirskikh* ("The Legend of the Princes of Vladimir"), which describes the descent of the Russian princes from the brother of Augustus Caesar.

Also of the 15th century is the *Khozhdenie za tri morya* ("A Journey Across Three Seas"), by Afanasi (Athanasius) Nikitin, a merchant from Tver who from 1466 to 1472 traveled chiefly in India but also in Persia. It reveals the author as a resourceful, inquisitive traveler, tolerant of foreigners and their beliefs, but loyal to his country. Specifically regional characteristics are absent; Nikitin's interests are those of the whole of Russia. The *Khozhdenie* is written in colloquial, lively Russian, with an admixture of Persian, Arabic, and Turkish words. Regional traits are also absent from the *Povest o Petre i Fevronii* ("The Tale of Peter and Fevronia"), written in the principality of Murom-Ryazan, which may be ascribed to the 15th century. It contains an abundance of themes from folklore.

Of other 15th-century regional literatures, that of Novgorod was particularly highly developed, producing a succession of literary works—*e.g.,* the *Povest o novgorodskom belom klobuke* ("The Tale of the White Cowl of Novgorod")—written in defense of Novgorod's political and ecclesiastical independence. In the literature of Tver, which vied with that of Moscow, the most outstanding work is the monk Thomas' panegyric, *Slovo Pokhvalnoe o blagovernom i velikom Knyaze Borise Aleksandroviche* ("A Eulogistic Discourse on the Orthodox Great Prince Boris Aleksandrovich"), written *c.* 1453. The most significant work of the literature of Pskov is the story *O pskovskom vzyatii* ("Of the taking of Pskov"), describing with great pathos the subjugation of Pskov by Moscow in 1510. Isolated works appeared at this period also in Rostov, Suzdal, and Smolensk.

The surge of literary activity beginning at the end of the 14th century is connected with the so-called "Second South Slavonic influence" from Bulgaria and Serbia resulting from the influx of clerics into Russia after the conquest of their countries by the Turks. Among them were the Bulgarian Kiprian (Cyprian) and the Serb Pakhomi Logofet (Pakhomius Logothetes). The latter wrote lives of numerous Russian saints. As well as retranslations from the Greek, the propagandist content and ornate style of South Slavonic literature was brought to Russia from the South Slavonic countries, largely in hagiographical works, in particular those of Epiphanius the Wise (d. 1420), author of lives of St. Stephen of Permia and St. Sergius of Radonezh.

3. Literature of Unified Russia.—The establishment of a unified Russian state, and the final subjugation of the rival principalities, dates from the reign of Ivan the Terrible. In 1480 the liberation of Russia from two and a half centuries of Tatar domination was finally achieved. The single Muscovite state under the centralized power of the autocratic lord of Moscow became a state of many nationalities under the tsar. In about the middle of the 16th century, Ivan, with the support of the rising feudal nobility, began an energetic campaign against the powerful feudal princelings, the boyars, who wished to retain their long-established independence. This struggle was reflected in literature. The most notable spokesman for the nobility was an immigrant from Lithuania, Ivan Peresvetov, whose work, dating from the late 1540s, includes several propagandist tales and two petitions to Ivan the Terrible. In these, as in his other works, he advocates autocratic tsarist power based on existing military and civil services. The boyars were represented by a publicist of exceptional literary gifts, Prince Andrei Mikhailovich Kurbski (*c.* 1528–83). Kurbski was a pupil of the widely educated ecclesiastical writer Maxim the Greek (*c.* 1480–1556), who had gone to Russia from Mt. Athos in 1518. In his four epistles to Ivan the Terrible and in his *Istoria o velikom knyaze moskovskom* ("A History of the Grand Prince of Muscovy," edited with English translation, as *History of Ivan IV,* by J. L. I. Fennell, 1965), written in the 1460s and '70s after his flight to Lithuania to escape Ivan's wrath at losing a battle in Livonia, Kurbski severely castigated Ivan for his persecution of innocent boyars, and of himself, Kurbski. It must be admitted, however, that his political views (his attempt to preserve at least part of the boyars' independence and privileges, and to acquire official recognition of their rights) were already out of date. In his answers, Ivan defends the idea that the tsar's absolute power was a divine right, and reveals, as in his satirical epistles and pamphlets, the temperament of a passionate polemicist. (See *The Correspondence Between Prince A. M. Kurbsky and Tsar Ivan IV, 1564–79,* ed., with trans. and notes, by J. L. I. Fennell, 1955.)

About the middle of the 16th century Moscow's conception of itself as the third Rome, the centre of Orthodoxy and of political authority, began to take definite shape. There began to appear a succession of vast literary undertakings aimed at exalting and strengthening the Muscovite ecclesiastical and political traditions, and demonstrating that these had come down from the very beginning of Russian statehood—from Kievan Rus. In 1552 there appeared the grandiose compilation known as the *Velikie cheti minei* ("Grand Cheti Minei"), by the metropolitan of Moscow, Makarios (Macarius; d. 1563). In 12 volumes it collected numerous works of original and translated ecclesiastical literature: saints' lives, arranged as a calendar of monthly readings. It was followed by the *Stepennaya kniga* ("Book of Degrees"; *i.e.,* generations), containing biographies of outstanding Russian princes and ecclesiastical figures, completed in 1563 by Macarius' successor Andrew (Athanasius), the imperial confessor. At this period also were collected the important Muscovite chronicle compilations, includ-

ing the *Voskresenski* ("Resurrection") Chronicle and the *Nikonovski* ("Nikonian," or "Patriarchal") Chronicle. In the 1560s and '70s an enormous collection, the *Litsevoi Nikonovski svod* ("Illuminated Nikonian Compilation"), was produced. Based on the Nikonian Chronicle, it begins with the Creation and ends in the 1560s. It was enlarged and revised as the *Tsarstvennaya kniga* ("Imperial Book"). An apologia for Ivan the Terrible and the state of Muscovy is the *Kazanski letopisets* ("Kazan Chronicler"), relating the history of the empire of Kazan from its foundation to its conquest by Ivan in 1552. Works such as the *Domostroi* ("Household Management") and the *Stoglav* ("Book of a Hundred Chapters") aimed at strengthening and systematizing the moral, social, domestic, and political standards of conduct established by the mid-16th century. The introduction of printing in Moscow did much to help Russian unification. The first dated book, *Apostol* ("The Acts of the Apostles"), was printed in 1564, but the first experiments in printing in Moscow had probably been made since *c.* 1553.

The end of the 16th century and the beginning of the 17th were marked by stormy political events known as the *"Smuta"* ("Troubles" or "Disorders"); they were characterized by an intense anti-feudal struggle, into which were drawn both the peasants, who were impoverished by serfdom, and the boyars, who had been defeated by the feudal nobility. The situation was complicated by the intervention of the Swedes and Poles, who were only repulsed by the united efforts of the Russian people. The events of the "time of troubles" are described in a succession of tales, on the one hand echoing the social and political upheavals, and on the other commemorating the surge of patriotism against foreign intervention.

The elegance and artistry of the Muscovite literary tradition was shattered by the "time of troubles." Social groups which had earlier played only a minor part in cultural life appeared on the literary scene. New writers and readers from farther down the social scale introduced secular themes, elements of realism, and a vein of folklore into literature. Examples are the stories of the capture of the town of Azov in 1637 by the Don Cossacks, and, in particular, of its siege by the Turks in 1641, which are outstanding literary works. The international relations of the state of Muscovy, which had grown significantly stronger, helped the flow of secular literature from the West, in many cases via Ukrainian literary figures, who had established connections with Moscow, particularly after the union of the Ukraine with Russia in 1654. The secular translated story, the tale of chivalry, the humorous *novella,* replaced Byzantine religious didactic literature, or existed alongside it. Folklore began to intrude noticeably into literature: the only records of folk *byliny* date from the 17th century.

The original Russian secular story begins to appear from about the second half of the 17th century. Side by side with tales in which the conservative tradition of the Church Fathers still predominates, such as the *Povest o Gore i Zlochastii* ("The Tale of Woe-Misfortune") which tells how "Woe-Misfortune" caused a youth to turn monk; and the *Povest o Savve Grudtsyne* ("The Story of Savva Grudtsyn"), there appeared the *Povest o Frole Skobeeve* ("The Tale of Frol Skobeev"), recounting the adventures of a rogue and cheat; and the *Povest o Karpe Sutulove* ("The Story of Karp Sutulov"), a comic story about a prudent merchant's wife who tricks three admirers and so preserves her honour during her husband's absence. These last two stories are both free from accepted moral and religious principles. Satire and parody of the court, church, and legal procedure of Muscovy began to be written: *e.g.,* the *Povest o Shemyakinom sude* ("The Tale of the Trial of Shemyaka") the *Povest o Yershe* ("The Story of Ruff, son of Ruff"), the *Kalyazinskaya chelobitnaya* ("The Petition of Kalyazin Monastery"), and the *Povest o kure i lisitse* ("The Tale of the Rooster and the Fox," a satire on formal piety).

Tendencies to secularization can also be seen in the genre of hagiography. Even at the beginning of the 17th century a life of St. Juliania Lazarevskaya (d. 1604) by her son, Kalistratus Osorin, describes a saintly life lived in the world, not in a monastery. The autobiography of the head of the Old Believers, the archpriest

Avvakum, written between 1672 and 1675 (translated from the 17th-century Russian as *The Life of the Archpriest Avvakum by Himself,* by J. Harrison and H. Mirrlees, with preface by D. S. Mirsky, 1924), also belongs basically to the traditional hagiographical genre, but it is full of topical material and realistic detail. Avvakum thus turns the canonical form of a typical hagiography into a polemically incisive narrative of his own life and the lives of his relatives, written, as were all his works, in the vivid, colourful, conversational speech of a literary master.

At the beginning of the 17th century, mainly under the influence of Ukrainian literature (*q.v.*), verse began to develop. At first it was clumsy and rhythmically unorganized, but later the learned Kievan monk Simeon of Polotsk (1629–80), an immigrant from White Russia, introduced syllabic verse. This was developed by his pupils, Silvestr Medvedev (1641–91) and Karion Istomin (mid-17th to early 18th century). In 1672, with the help of a German Lutheran pastor in Moscow, Johann Gottfried Gregori, a secular court theatre was created, with a basically Western European repertory. Almost at the same time in Moscow Simeon of Polotsk's first attempts at school drama appeared. His *Komedia pritchi o bludnom syne* ("The Comedy of the Parable of the Prodigal Son"; publ. 1685), in which the biblical story is adapted to treat the subject of fathers and sons in Russia before the introduction of Westernization, is particularly interesting. Thus it can be seen that Russian literature in the second half of the 17th century was transitional between the old literature and the literature of modern times, which dates from the beginning of the 18th century.

(N. K. G.)

II. MODERN PRE-REVOLUTIONARY LITERATURE

Modern Russian literature is usually said to begin in the first decade of the 18th century, when literary works, as distinct from religious, official, and educational books, began to be printed. During the century newspapers and periodicals were published—including literary magazines, which were to become so prominent a feature of the 19th-century literary scene. Classicism was the dominant movement in 18th-century literature. Toward the end of the century, however, it was displaced by the sentimental movement, though realistic tendencies can be perceived in both classical and sentimental schools.

A. The 18th Century

The development of literature from the end of the 17th century to the beginning of the 19th can be divided roughly into five pe-

riods. The literature of the first—1690–1730—dominated by the reforms of Peter I the Great, is largely transitory, the borderline between literature and journalism being scarcely perceptible. The second—1730–50—is remarkable for the formation and consolidation of the classical movement. The third—1750–75—is notable for the growth of satire, which gradually undermined the classical movement, and the emergence of the sentimental movement. During the fourth—1775–90—the sentimental movement gained strength; and in the 1790s—the fifth period—it finally gained ascendancy, but was already giving way to the Romantic and realistic movements of the early 19th century.

1. 1690–1730.—Though some of Peter the Great's reforms (*e.g.*, reform of the alphabet, intensive development of secular printing, and the foundation of a periodical press; *see* RUSSIAN HISTORY) had no direct bearing on literature, they were to be of importance in its development. The most prominent literary figure at the beginning of the century was Feofan Prokopovich (1681–1736), archbishop of Novgorod, one of Peter's close associates. Active as publicist, poet, and dramatist, he may be described as the progenitor of two of the main themes in Russian literature: that of autocracy as a form of government and that of satire as a means of attack on, and exposure of, literary and political opponents. In his tragicomedy *Vladimir* (1705) and, particularly, in his satirical pamphlet *Ustav dukhovnia kollegii* (1721; "Rules of a Spiritual Academy"), he attacked the dissident clergy who opposed Peter's reforms; and in *Pravda voli monarshei* ("Truth of a Monarch's Will"), he maintained that the final aim of autocracy was "the well-being of the people as a whole," while "the people" (*i.e.*, the aristocracy) had no right to question the acts of the monarch, who ought to do nothing against the will of God.

The poetry of the period included solemn panegyric verse celebrating the victories of Russian arms, as well as the new genre of love lyrics and elegiac poems on the themes of death and the vanity of human wishes. This period also saw the development of Russian secular drama, mostly in translation, treating conflicts between passion and duty, feeling and reason, and the interests of the individual and of society, themes to be developed by the classical playwrights. On the whole, this period did not produce any important literary works, but merely prepared for later development.

2. 1730–1750.—During the second period the first significant names in modern Russian literature appeared. The growth of cultural institutions—the creation, for example, of the first Academy of Sciences in St. Petersburg (1725), the foundation of the first university, in Moscow (1755), and of the first theatre, in St. Petersburg (1756)—assisted literary talent to develop. The leading literary genres were the ode and tragedy, both propagating enlightened absolutism. As in Western Europe (and more particularly in France), the cult of reason lay at the foundation of neoclassicist aesthetics. Writers stressed man's rational ability to suppress passion and feeling in face of duty to the state, creating characters who were primarily servants of the state. In general, they depicted ideas rather than people.

The leading writers of the classical school were Prince Antioch Dmitrievich Cantemir (1708–44; *see* CANTEMIR), the first Russian secular poet; Vasili Kirilovich Trediakovski (1703–69), one of the most scholarly men of his time; Mikhail Vasilevich Lomonosov (1711–65), poet, grammarian, scientist, and literary critic; and Aleksandr Petrovich Sumarokov (1718–77), poet and dramatist. Cantemir, who translated Anacreon's odes and Horace's epistles, is known mainly for his love lyrics and his nine satires (written 1729–39, publ. 1762), in a colloquial style. He is regarded as the founder of Russian satire. Educated at the Sorbonne, Trediakovski began by translating Paul Tallemant's *Journey to the Isle of Love*, the first erotic work to be published in Russia. He helped to reform Russian prosody, replacing the syllabic metres inherited from Poland by tonic and accentuated measures more natural to Russian. Lomonosov was the creator of the famous "three styles" of poetic diction characteristic of Russian neoclassicism: the "high" (or grand) style for heroic poems, odes, and prose works dealing with serious subjects; the "middle" style for dramatic works demanding colloquial speech (except when "heroic and lofty thoughts" were to be expressed, where the "high" style was obligatory), and for "epistles, satires, eclogues and elegies, and prose descriptions of memorable deeds and noble doctrines"; and the "low" style for "comedies, epigrams, songs, letters in prose, and precise descriptions," such as his own *Pismo o polze stekla* (1752; "Epistle on the Use of Glass"). He advanced the theoretical study of the Russian language, which, he maintained in the foreword to his *Retorika* (1748; "Rhetoric"), was no whit inferior to any European language "in natural richness, beauty, and strength." In the foreword to his Russian grammar (1757) he thus defined the scope of the Russian language:

> "Charles the Fifth . . . [said] that Spanish was a language fit for converse with God, French with friends, German with enemies, and Italian with women. But had he known Russian he would surely have found in it the magnificence of Spanish, the vivacity of French, the vigour of German, the tenderness of Italian and, above all, the richness and forceful succinctness of expression of Greek and Latin."

Sumarokov, who followed the rules of French classical drama and wrote the first Russian classical tragedy, *Khorev* (1747), was adept in a variety of genres, and opposed Lomonosov's "florid" style. He owed his popularity to his numerous love lyrics, elegies, eclogues, and idylls, his love lyrics in particular being noted for sincerity and spontaneity. He also wrote six tragedies, including a free adaptation of *Hamlet*, and four comedies. Four of his tragedies deal with subjects from classical history, and all but one end with the triumph of virtue over vice. His themes are the opposition between duty and feeling, reason and passion, the highest manifestation of heroism being suppression of personal desire. His tragedies, strongly influenced by Racine, are full of heroic female characters, and were intended as a school of noblemen's moral values. In his comedies he sought to improve the moral standards of the Russian aristocracy by showing up dishonest lawyers and judges, fops and pedants. In his periodical, *Trudolyubivaya pchela* ("The Industrious Bee"; 1759), he exposed corruption among officials and attacked landowners for maltreating their serfs, but defended social inequality as "natural and lawful," convinced that serfdom was necessary for "the general well-being" of the country. His satiric articles and fables laid the foundation of the satire of the next decade.

The first breach in classicism was made by Mikhail Matveevich Kheraskov (1733–1807), famous for two epic poems modeled on Voltaire's *Henriade: Rossiada* (1771–79), on the capture of Kazan by Ivan the Terrible; and *Vladimir vozrozhdenny* (1785), on St. Vladimir's introduction of Christianity to Russia. He began his literary career with a tragedy *Venetsianskaya monakhina* (1758; "The Venetian Nun"), in which he broke the classical rules. It had three, instead of five, acts, extolled the "immortal passion" of love, and introduced ordinary people. The play was an early Russian example of the middle-class drama. (*See* also DRAMA: *Modern Drama.*)

3. 1750–1775.—Influenced by the Pugachev rebellion (1773–75), the most important theme in the third period was that of serfdom and the relationship between landowner and peasant. The social influence of literature greatly increased. This led both to a widening circle of readers and to active participation in literature of people from all classes. Trediakovski and Sumarokov still contributed important works in this period. Sumarokov, in his last three tragedies, attacked the idea of a tyrannical ruler and pleaded for an "enlightened emperor," and even went so far in his most famous tragedy, *Dimitri Samozvanets* (1771; "Dimitri the Pretender"), as to justify the overthrow of a "tyrant" by the "people." In his *Telemakhida* (1766), a free rendering of Fénelon's *Télémaque*, Trediakovski declared that while "the Tsar wields power over the whole people, the laws have power over the Tsar too," a sentiment that made Catherine II pour scorn on the poem in her journal *Olla Porrida Vsyakaya vsyachina* (1769–70), modeled on the English *Spectator*, as "untalented and boring."

The two most prominent writers of the period were the playwright Denis Fonvisin (1744–92) and the writer and publisher Nikolai Novikov (1744–1818). Beginning by translating fables, Fonvisin later wrote original satirical fables, such as *Lisitsa-koz-*

nodei (1762; "The Fox and the Preacher"), written shortly after the death of the empress Elizabeth (Elizaveta Petrovna), in which he attacked her hypocritical courtiers, who "by their supreme powers merely sated their tyrannical passions." But it was with two prose comedies, *Brigadir* (1766–69) and *Nedorosl'* (1782), that Fonvisin triumphed as a playwright. An opponent of serfdom, Novikov, like Fonvisin, directed his satire not against serfdom itself, but against the landowners' misuse of their powers. His first periodical, *Truten* ("The Drone"; 1769–70), had the significant epigraph: "They labour and you feed upon their labour." In it he exposed the corruption of the civil servants, the ignorance of most noblemen, their hostility to learning, and their obsequious attitude to French culture. It provoked furious rejoinders from *Olla Porrida,* but its subscribers rose in three months from 600 to more than 1,200, while those to Catherine II's journal dropped from 1,500 to 500. The empress suspended *Truten* for a month in the autumn of 1769, after which Novikov moderated his satire, his journal reappearing with the epigraph: "It is dangerous to criticize where there is much brutality and madness." At the end of 1770 it had to suspend publication, and Novikov's second journal, *Pustomelya* ("The Windbag"), was suspended after only two issues. Novikov dedicated his third journal, *Zhivopisets* ("The Painter"), to "the authoress of the comedy 'Oh, Time!'" (Catherine II), begging her to imitate Molière "in looking with a dispassionate eye on our vices, our ingrained bad habits, our malpractices and all our immoral acts"—the policy he himself intended to pursue. In it he published in 1772 two of his most famous satires: *Otryvok puteshestviya v I . . . T . . .* ("A Fragment of a Journey"), and *Pismo k Falaleyu* ("Letter to Fallaley"). The first gives a shattering picture of the "poverty and slavery" of the peasants and their subjection to their masters' whims, and the second, supposedly written by a provincial landowner to his son in St. Petersburg, provides insight into the serfowners' mentality. But, however truthful his descriptions of Russian country life, and however faithful his reproduction of the colloquial language of the cruel, greedy, and superstitious landowners (which makes the "Letter to Fallaley" one of the finest literary works of the century), the fact that he never condemned serfdom saved Novikov from Catherine's wrath but robbed his satire of efficacy as a revolutionary instrument.

By mid-century there were in circulation many translations of novels and short stories, including those by Defoe, Swift, and Fielding. In 1769 the first Russian translation of Cervantes' *Don Quixote* was published. The most important novelist of the period was Fedor Aleksandrovich Emin (?1735–70), whose best novel *Pisma Ernesta i Doravry* (1766; "Letters of Ernest and Doravra"), a free adaptation of Rousseau's *La Nouvelle Éloïse,* is interesting as the first attempt in Russian fiction at psychological analysis of the thoughts and feelings of ordinary people. It deals with the emotional experiences of two lovers prevented by circumstances from being united. "There is no greater pleasure," the hero exclaims, "than to have a sensitive soul!" But this evidence of the influence of the Western cult of sensibility is only superficially significant, for the novel adheres to classical aesthetic rules, and its hero's conception of duty triumphs over his passions. In it Emin exposes the evils of serfdom, but does not attack serfdom as an institution. His son, Nikolai Emin (1761?–1814), also a popular novelist, was less interested in the social iniquities of his time. His novels show the growing influence of the sentimental school: their heroes read Edward Young's *Night Thoughts,* and dissolve in tears. Mention should also be made of a novel by Pavel Lvov, influenced by Samuel Richardson (*q.v.*), *Rossiiskaya Pamela, ili istoria Marii, dobrodetelnoy poselyanki* (1789; "The Russian Pamela, or the Story of Maria, the Virtuous Country Girl"). "I call her the Russian Pamela," Lvov wrote, "to show that in our country too there are tender hearts and great souls among the lower classes." A popular novelist to emerge from "the lower classes," Mikhail Dimitrievich Chulkov (*c.* 1743–1792), was concerned with entertaining his readers: his novels lack the lofty moral admonitions that abound in the works of classical writers. His first fictional work, *Peresmeshnik, ili slavenskie skazki* (1768; "The Mocker, or Slavonic Fairytales"), is a collection of comic and adventurous stories narrated by the author and by a monk. His second, *Prigozhaya povarikha* (1770; "The Fair Cook," or "The Adventures of a Whore"), contains naturalistic descriptions of contemporary life and manners.

Between 1770 and 1780 the sentimental movement gained ground. Its influence first becomes noticeable in adaptations of French comic operas. These were followed by native comic operas, such as *Rosana i Lyubim* (1778), by Nikolai Petrovich Nikolev (1758–1815), the main theme of which is the superiority of moral equality over social inequality. It advances, cautiously, the idea that "The peasant too perhaps /Is as great in soul/ As the ruler of kingdoms." The anti-serfdom note can be detected in other comic operas of the period, such as *Neschastie ot karety* (1779; "An Accident with a Carriage"), by Yakov Borisovich Knyazhnin (1742–91), famous for his tragedies and translations of French classical dramas; *Kofeinitsa* ("The Coffee Fortune Teller"), by Ivan Krylov (1769–1844), author of lyric odes and epistles, the greatest Russian fabulist; and *Mel'nik, koldun, obmanshchik i svat* (1779; "The Miller, Wizard, Quack and Matchmaker"), by Aleksandr Onisimovich Ablesimov (1742–83). The American Revolution, fully reported by Novikov in his *Moskovskie Vedomosti* ("Moscow News"), raised again the problem of an autocratic ruler's duties to his subjects. Fonvisin—in his *Rassuzhdenie o nepremennykh gosudarstvennykh zakonakh* (1783; "Reflections on the Necessity of State Laws")—maintained that the tsar should be as completely subject to the laws of the land as his lowest subjects. In his satires, and, even more, in his popular fables, Ivan Ivanovich Khemnitser (1745–84) touched on the same theme, though more guardedly, while Knyazhnin, in his tragedy *Roslav* (1784), demanded that the emperor should be subject to his own laws, and in *Vadim Novgorodski* (1789; "Vadim of Novgorod") openly attacked autocracy as "responsible for all the troubles in the state" and "an enemy of the purest virtue," which made Cath-

erine II order the destruction of all copies of the tragedy. Even Nikolev declared, in his tragedy *Sorena i Zamir* (1784), that "to destroy a tyrant is a duty not a crime," a sentiment Catherine II, whose own plays had a mildly liberal cast (it was not for nothing that she had corresponded with Voltaire), did not find dangerous since, as she remarked to a high-ranking official, "the author is merely attacking autocratic tyrants while you call Catherine your mother."

4. 1775–1790.—The first unmistakable indication of the declining power of classicism was provided by the popular narrative poems of Ippolit Fedorovich Bogdanovich (1743–1803), especially his *Dushenka* (1775), a free adaptation of La Fontaine's *Les Amours de Psyché et de Cupidon.* Bogdanovich held that poetry must "beautify" nature. He was regarded by the sentimentalist writers as their predecessor.

Gavrila Derzhavin (1743–1816), the greatest Russian poet of the 18th century, gave the most vigorous expression to the change from classicism to sentiment. His first works—odes as well as lyrics (1760)—show the influence of Lomonosov and Sumarokov. Soon, however, he took up an independent attitude toward social evils. In his famous paraphrase of Ps. 82 he tells the "rulers and judges" (as he first called the poem) that their duty is "To preserve the laws/ Not taking account of a man's station/ And from the hands of persecutors to save/ The poor, the helpless and the widows." But, he goes on, "They do not listen, villainies, robberies/ Tortures and groans of the poor/Undermine and trouble kingdoms/ And plunge the throne itself into ruin." His ode on the death of Prince Meshcherski (1779) is full of reflections on the transience of life and the inevitability of death ("On the edge of a precipice we walk/ . . . we are born to die"), but ends on a characteristically Horatian note: "Life is Heaven's instant gift;/ Fashion it to your own content/ And with a soul pure and innocent/ Bless the blows of Fate." In *Bog* (1784; *Ode to the Deity*) Derzhavin upholds the classical tradition of Lomonosov, but in *Felitsa* (1785), an ode to Catherine II, he inaugurates his own kind of humorous panegyric, extolling the virtues of the empress but satirizing the vices of her favourites. He reached his greatest heights during the next decade with odes "On the Capture of Ismail," "To the Nobleman," "To My First Neighbour," "On the Bullfinch" (on the death of Suvorov), and others, in which his attacks on "unworthy and vicious noblemen" were intensified. His finest poems—*e.g.*, the magnificent *Vodopad* (1794; "Waterfall"), and *Pavlin* ("The Peacock"), and his so-called "anacreontic" poems (collected 1804), full of the love of life and its joys, such as *Priglashenie k obedu* (1798; "Invitation to Dinner") and *Zhizn zvanskaya* (1807; "Life in Zvanka")—the poet's small estate—belong to this period. Derzhavin accepted serfdom as natural and lawful, and on the whole his poetry expresses the ideology of the ruling classes; yet his realistic representation of everyday life and his simplification of poetic diction by introducing colloquial speech tend to emphasize the democratization of poetry.

5. The 1790s.—If the literature of the mid-18th century affirmed the conception of an ideal state ruled by an enlightened monarch, and demanded subjection of individual interests to those of the state, that of the 1790s, influenced by the French Revolution, raised the themes of the rights of man and the role of the nation as a whole. Aleksandr Radishchev (1749–1802), in his ode to liberty (*Vol'nost,* written 1781–83), hailed the American Revolution and attacked serfdom, but it was his denunciation of autocracy that made Catherine II describe the ode as "a rebellious poem," in which the tsar was threatened with execution. Her attitude to Radishchev's famous *Puteshestvie iz Peterburga v Moskvu* (1790; *Journey from St. Petersburg to Moscow*) is summed up in her remark: "The author does not like Tsars and . . . pins his hope on the rebellion of the peasants."

Apart from violently satiric works, among them the famous comedy *Chicane* (1798), by Vasili Vasilevich Kapnist (1757–1823), and Krylov's *Pochta Dukhov* (1789; "Post of Spirits"), in which gnomes, undines, and sylphs correspond with "the Arab philosopher Malikulmuk" about the crying injustices among earth dwellers, the main literary movement was sentimentalism, led by Nikolai Karamzin (1766–1826). In Russian sentimentalism subjective perception and appraisal are combined with denial of classical abstractions and idealization of man's "natural condition." Karamzin opposed to the classical emphasis on reason a doctrine of poetry as an expression of "feeling"—of the writer's subjective experiences and attitude to life, irrespective of its objective significance. The sentimentalists, moreover, put forward the claims of "sensibility" as a precondition of aesthetic impressions, emphasizing art's emotional foundation. "A writer," Karamzin stated, "must paint the portrait of his own heart and soul." Unlike Derzhavin, Karamzin was not interested so much in reality as in the feelings and moods it arouses in the poet, whom he describes as "a cunning wizard" whose "living thought transforms, like a fairy, flowers into beautiful maidens." According to him "the first [*i.e.*, greatest] poetic creation" is "an effusion of a languorous and grieving heart." This elegiac mood, so characteristic of Karamzin's latter poetry, is expressed in his famous novel *Bednaya Liza* (1792; "Poor Liza"), in which, for the first time in Russian fiction, descriptive passages, used to emphasize the hero's feelings, are an important component. Karamzin regarded his lyric poetry as a means of creating an intimate illusory world. To him poetry was "the flower garden of sensitive souls." In his novel *Julia* (1794) he idealized country life and withdrawal into "the embraces of nature," for only there "a sensitive soul can enjoy love and tenderness to the full." His other novels—*Ostrov Borngolm* ("Island Bornholm"), and *Sierra Morena* (both 1793)—are precursors of the Russian Romantic novel. Indeed, many of his poetic formulae—"glory is an empty sound," "friendship is a delightful gift," "the delight of careless youth," "I was the plaything of passions"—became the clichés of the 19th-century Romantics.

B. The 19th Century

1. Poetry.—The most eminent of Karamzin's followers, Ivan Ivanovich Dmitriev (1760–1837), achieved fame with his songs, short odes, elegies, fables, and satirical narrative poems. Dmitriev's fables are written in the elegant style of the Russian upper classes, and were soon eclipsed by the masterly fables of Krylov, who combined colloquial speech with the native wisdom of the peasant, and whose fables (written 1810–20) are among the great treasures of Russian literature.

Chief among early 19th-century Romantic poets was Vasili Zhukovski (1783–1852). A follower of Karamzin, he founded with other Karamzin partisans the semi-humorous literary society, Arzámas, as a counterblast to the classicists, who had earlier founded an anti-Karamzin society, "The Conversation of Lovers of Russian Literature." Zhukovski's poetic output—Romantic poems and ballads—is not considerable: his fame rests on his translations of German and English poets. His translation of Gray's *Elegy* was published in Karamzin's journal *Vestnik Evropy* in 1802. He created a new poetic language, based on Karamzinian principles but surpassing that of Karamzin by its purity of diction and melodiousness of verse. Radishchev's political influence is shown mainly in the poetry of some of the leaders of the Decembrist insurrection, headed by Kondraty Fëdorovich Ryleev (1795–1826), who expressed abhorrence of the tyranny of the tsars in his "Meditations" (1825). Ryleev also wrote Romantic poems whose heroes gladly face death in their fight against "the oppressors of the people."

The greatest poet of the early 19th century, and the greatest

Russian poet, is Aleksandr Pushkin (1799–1837). Already his first poems, *Ruslan i Lyudmila* (1820), *Kavkazski plennik* (1822; *The Prisoner of the Caucasus*), and *Bakhchisaraiski fontan* (publ. 1824; *The Fountain of Bakhchisarai*), though Romantic (indeed, Byronic) in style, show how greatly he surpasses his contemporaries in mastery of diction and verse. It was, however, only in his great narrative poem, *Evgeny Onegin* (written 1823–31), that Pushkin achieved the clarity and compactness of his mature works. He achieved also what no other Russian poet has achieved: integration of idea and character; a warm, humane humour; ability to bring everything he touches to life; an understanding of the human heart surpassed by few of the greatest creative writers of the 19th century; and a mastery of language astonishing in its simplicity and profundity. His other narrative poems written at this time, *Count Nulin* (1828) and *Domik v Kolomne* (1830; *The Small House in Kolomna*), reveal a playful satiric vein, a blend of realism and irony with good-humoured sympathy for human foibles. *Tsygane* (publ. 1827; *The Gypsies*) and *Poltava* (publ. 1829) are masterpieces of two quite different types, the first a tragedy of frustrated passion and the second the apotheosis of a hero-king in the person of Peter the Great. During the same period Pushkin wrote his greatest lyrics and the often-quoted rhetorical *Prorok* (1826; *Prophet*). At the beginning of the 1830s he wrote his fairytales in verse, which included "The Golden Cockerel" (on which Rimski-Korsakov's opera is based), and the magnificent "King Saltan." In 1833 he wrote *Medny Vsadnik* (publ. 1837; *The Bronze Horseman*), a narrative poem in which Peter the Great personifies the elemental forces which sweep puny man, with his puny desires, out of their path. Pushkin never surpassed this poem, with its onomatopoeic undertow of horror. His poetic dramas (written in autumn, 1830) include *Boris Godunov* (publ. 1831), a full-length historical play in blank verse, and four "little tragedies."

The period's other major poet, Mikhail Lermontov (1814–41), sprang to fame in 1837 with his poem on the death of Pushkin, the last seven lines of which expressed the general feeling that Pushkin's death had been contrived by people close to the court, an accusation that resulted in his exile to the Caucasus. Lermontov's most Romantic poems, such as *Mtsyri* (1840) and the celebrated *Demon* (1839), deal with Caucasian themes. Dostoevski summed up Lermontov's significance:

> He wrote so many excellent poems for us. . . . He cursed and suffered. He revenged himself and forgave, he wrote and roared with laughter. He liked to whisper strange fairy tales to sleeping young girls, setting their virginal blood on fire. . . . He told the story of his life and his love adventures. . . . He made us feel depressed, vexed, sad and sorry, and we were filled with bitterness and spite. In the end he got tired of us. . . . We followed his fortunes for a long time, but at last he perished somewhere—aimlessly, stupidly and even ridiculously. . . .

Of minor poets of the Russian Golden Age, mention must be made of Evgeni Baratynski (1800–44), author of elegiac narrative poems; Konstantin Nikolaevich Batyushkov (1787–1855), a master of pagan and sensual poems; Prince Pëtr Andreevich Vyazemski (1792–1878), who wrote satires and epigrams; and Nikolai Mikhailovich Yazykov (1803–46), the "Bacchic" poet, whose early verse celebrates wine, women, and song. Among poets of the first half of the century must also be mentioned Fedor Ivanovich Tyutchev (1803–73), a profound and accomplished lyrical poet; and Nikolai Nekrasov (1821–78), whose narrative poems, songs, and realistic satires deal with what he described as "the sufferings of the common people."

2. Drama.—The only dramatic masterpiece of the period, *Gore ot uma* (1831; *Wit Works Woe*), is a comedy written in the French manner by Aleksandr Griboedov (1795–1829). Its hero is an intellectual rebel of great perception who, however, suffers from extraordinary lack of initiative. Its other characters are fully realized types of Moscow high society, most of whose names have passed into the Russian language.

3. Prose.—With Pushkin and Lermontov the Golden Age of poetry ended, and the great age of creative prose began. Pushkin turned increasingly to prose in the last years of his life. Lermontov's novel *Geroi nashevo vremeni* (1840; *A Hero of Our Time*) was immediately successful. Its hero, Pechorin, a man of great gifts which he dissipates in a life of debauchery, is one of the typical misfits of Lermontov's generation who, in his poem *Duma* (1839; "Meditation"), he had foretold would "pass away without leaving a trace behind, without tossing a fruitful idea to the coming generations, without the genius of work begun."

The first 19th-century novelist to achieve wide popularity was Mikhail Nikolaevich Zagoskin (1789–1852), whose *Yuri Miloslavski, or The Russians in 1612* (1829), published not long after the Napoleonic campaign of 1812, appealed to the public by its crude nationalistic spirit. The most popular Romantic novelist was Aleksandr Aleksandrovich Bestuzhev (pseudonym Marlinski; 1797–1837), who was exiled to Siberia and then to the Caucasus for his part in the Decembrist revolt, and who for a time was regarded as the foremost Russian novelist. "He left his mark on his generation," Turgenev wrote. "Heroes *à la Marlinski* were to be seen everywhere. It was about them that the word 'fatal' was invented." But the writer who was to leave his mark both on his own and on future generations was Nikolai Gogol (1809–52), who, arriving penniless in St. Petersburg, soon became one of the most discussed writers in Russia. When one considers Gogol's great influence on Russian literature and on the Russian revolutionary movement, it must be remembered that, a Ukrainian by birth, he saw the Russians as an outsider and with the irreverence of one brought up in a country where relations between big and small landowners were more patriarchal than in Russia itself. That was perhaps why, as Turgenev declared, he revealed the Russians to themselves; and why, as Dostoevski maintained, "Gogol's characters give rise in the Russian mind to the most turbulent ideas, which are impossible to solve now, if ever." Gogol became famous with five volumes of short stories (1831–35), but the revolutionary impact of his writings became evident in 1836 with the performance of his comedy *Revizor* (*The Government Inspector*). Its apparent subject was the officials of an obscure provincial town, but actually it presented a microcosm of the Russian state. What saved it from being banned was its laughter, which Gogol considered the only positive character in it. "He laughed all his life at himself and at us," Dostoevski was to write, "and we too laughed so long that in the end we began to cry with laughter." The protests aroused by the play forced Gogol to go to Italy, and he there finished the first part of his novel *Mërtvye dushi* (1842; *Dead Souls*). Gogol was a conservative, and an upholder of autocracy and serfdom, who never thought that his play and his novel were

(LEFT) NIKOLAI GOGOL, BY F. A. MOLLER, 1841; (RIGHT) THE LAST SCENE OF "REVIZOR" ("THE GOVERNMENT INSPECTOR"): LITHOGRAPH AFTER THE DESIGN OF AN UNKNOWN ARTIST, POSSIBLY GOGOL HIMSELF; IN THE STATE LITERARY MUSEUM, MOSCOW

destroying the things he stood for. When this dawned on him, he spent the rest of his life trying to undo the "harm" his writings had done.

One of Gogol's last stories, *Shinel* (1842; *The Overcoat*), led to the creation of a whole school of writers, the "natural" school, as the critic Vissarion Belinski (1811–48) called it. One of its most brilliant followers was Fëdor Dostoevski (1821–81). His literary career falls into two periods: 1844 to 1849, ending with his trial and imprisonment in Siberia; and 1860, when he returned to St. Petersburg, to 1881. The first is notable mainly for his short stories of the St. Petersburg slums and the life of the poor degraded civil servants. His first short novel, *Bednye lyudi* (1845; *Poor Folk*), brought him to Belinski's notice, but their friendship soon ended, and he joined the revolutionary circle of Mikhail Petrashevski, at whose Friday "at homes" he recited Derzhavin's paraphrase of Ps. 82, and Belinski's letter to Gogol, attacking Gogol's reactionary views as expressed in "Selected Passages from the Correspondence of My Friends" (1847), which the government had banned as seditious. This led to his exile. On his return, faced with the impending liberation of the serfs and the new relationship that would inevitably ensue between landowners and peasants, he decided to publish a magazine to help solve this problem. In *Vremya* ("Time"; 1861–63), suspended and renamed *Epokha* ("Epoch"; 1864–65), he took up an attitude midway between the Slavophils and conservatives, on the one hand, and, on the other, the westerners and revolutionaries grouped round *Sovremennik* ("The Contemporary"), the magazine owned by Nekrasov, but run by the so-called utilitarians, Nikolai Chernyshevski (1828–89) and Nikolai Aleksandrovich Dobrolyubov (1836–61), a brilliant young critic. Dostoevski's attempt to bridge the gulf between the mass of illiterate peasants and the comparatively few members of educated classes, by advocating that the latter should "return to the soil," ended in failure, but it was in *Epokha* that he published *Zapiski iz podpolya* (1864; *Letters from the Underworld*), his first psychological study of a self-centred intellectual egoist, into whose mouth he put his first violent attack on the doctrines of the "utilitarians." His four greatest novels, *Prestuplenie i nakazanie* (1866; *Crime and Punishment*), *Idiot* (1868–69; *The Idiot*), *Besy* (1871–72; *The Devils*, or *The Possessed*), and *Bratya Karamazovy* (1879–80; *The Brothers Karamazov*), show the same mixture of deep psychological study and violent attacks on hated ideas and institutions. It is his intuitive understanding of the human heart, and of the tragic aspects of life, together with his unsurpassed moments of illumination, that makes these novels immortal.

Although Ivan Turgenev (1818–83) lacked Dostoevski's moments of illumination, his stories and novels too transcended topical problems and laid bare the eternal. He won popularity with his *Zapiski okhotnika* (1852; *A Sportsman's Notebook*), in which serfs were shown to be not merely equal, but, indeed, superior, to their masters in intelligence, decency, and humanity. The book paved the way for the abolition of serfdom. With his first novels —*Rudin* (1855), *Dvoryanskoe gnezdo* (1859; *A Nobleman's Nest*), *Nakanyne* (1859; *On the Eve*)—he enhanced his reputation as a liberal-minded thinker and as one of the finest prose writers of the day. His greatest novel, *Otsy i deti* (1862; *Fathers and Sons*), set the left-wing writers of *Sovremennik* (who took Bazarov, its nihilist hero, for a caricature of themselves) against him, and he never regained popularity with the young progressives. *Dym* (1867; *Smoke*), in which he had bitter truths to say about all classes of Russian society, and *Nov* (1876; *Virgin Soil*), in which he analyzed the Russian revolutionary movement and forecast the rising power of the managerial class, deepened the enmity of the increasingly intransigent radicals. It was only on his last visit to Russia that he was again popularly acclaimed.

The third and greatest of the creative writers of the century, Count Leo Tolstoi (1828–1910), mostly stood aloof from the literary scene. His two great novels, *Voina i mir* (1863–69; *War and Peace*) and *Anna Karenina* (1873–76), raised him to a pinnacle above his contemporaries, and even his denial of his art, following his conversion to Christianity in 1876, failed to affect his supremacy. In *Kreitserova Sonata* (1889; *The Kreutzer Sonata*), *Smert Ivana Ilyicha* (1886; *The Death of Ivan Ilyich*), *Voskresenie* (1899; *Resurrection*), and *Hajji Murad* (1901–04) his creative genius asserts itself over the philosophic and religious convictions that mar many of his last stories.

Tolstoi's distinguishing mark as a creative artist was his genius for analytical dissection of character; and a somewhat analogous gift is discernible in the novels of Ivan Goncharov (1812–91), who, in his greatest novel, *Oblomov* (1859), achieves his shattering effects by the accumulation of seemingly unimportant details. Aleksei Pisemski (1820–81) was another major novelist. He became popular with *Tysyacha dush* (1858; *A Thousand Souls*), but his popularity waned after his tendentious attacks on the radical movement in *Vzbalmuchennoe more* (1863; *Troubled Sea*). His tragedy, *Gorkaya sudbina* (1859; *A Hard Lot*), though popular, shows the dangers of too realistic a representation of life.

The most prolific professional playwright of the century, Aleksandr Ostrovski (1823–86), became famous with the banning of his first comedy *Bankrot* (1850; *The Bankrupt*), in which he exposed the low business morality of the Moscow merchants. Between 1847 and 1886 he wrote about 40 plays, including a cycle dealing with the life of the Moscow merchants. The most famous of these, the tragedy *Groza* (1860; *The Storm*), was interpreted by Dobrolyubov in his study of Ostrovski, *Tëmnoe tsarstvo* (1860; *The Realm of Darkness*), not so much as the personal tragedy of a young girl married to a weakling and in love with a man too weak to help her, but as a protest against the ignorance, brutality, and acquisitiveness of the Moscow merchant class. Ostrovski also wrote a series of historical plays; a verse fairytale *Snegurochka* (1873; "The Snow Maiden"); and a series of comedies of high life; *e.g.*, *Na vsyakovo mudretsa dovolno prostoty* (1868; *Even a Wise Man Stumbles*), *Les* (1871; *The Forest*), and *Volki i ovtsy* (1875; *Wolves and Sheep*).

The great satirist of the century, Mikhail Saltykov (1826–89), was a pillar of the radical movement as editor of *Sovremennik* and *Otechestvennye Zapiski* ("Fatherland Annals"). Like the 18th-century satirists, he excelled as a fabulist. He wrote one of the century's most brilliant novels—*Gospoda Golovlevy* (1876; *The Golovlyov Family*). Its hero, Yudushka (Little Judas), surpasses even Gogol's most villainous characters in, as Saltykov said, "idleness, uselessness and drunkenness."

The short story was developed by Nikolai Leskov (1831–95), whose style is remarkable for richness of idiom. He became popular with his novel *Soboryane* (1872; *Cathedral Folk*), his famous picaresque story *Ocharovanny strannik* (1873; *The Enchanted Wanderer*), *Zapechatlenny angel* (1874; *The Sealed Angel*), *Levsha* (1882; *The Left-handed Craftsman*), and his anti-government satiric tale *Zayachi remiz* (1894; *The March Hare*). His starkly realistic story, *Ledi Makbet Mtsenskogo uezda* (1865; *Lady Macbeth of the Mtsensk District*), was used as the basis of an opera (1934) by Dmitri Shostakovich. Minor but original short-story writers of the last half of the century were Leonid Andreev (1871–1919), author of *Rasskaz o semi poveshennykh* (1909; *The Seven That Were Hanged*); Vsevolod Garshin (1855–88), author of *Chetyre dnya* (1877; "Four Days") and *Krasny tsvetok* (1883; "The Red Flower"); and Vladimir Korolenko (1853–1921), who was exiled to Siberia (1879–85), and whose stories with Siberian backgrounds made his reputation. It was Anton Chekhov (1860–1904), however, who became the acknowledged master of the short story, as well as a brilliant innovator in drama.

Chekhov was the first Russian writer of genius to adopt a neutral attitude to politics. Most of his short stories were written while he was a medical student and later when, as a young medical practitioner, he had to support his family in Moscow. But he never entirely gave up his practice until forced by ill health to live in Yalta. In his greatest short stories, *Step* (1888; *The Steppe*), *Skuchnaya istoria* (1889; *A Boring Story*), *Duel* (1891; *The Duel*), *Palata No. 6* (1892; *Ward 6*), *Tri Goda* (1892–95; *Three Years*), *Ionych* (1896), *Muzhiki* (1897; *The Peasants*), *Chelovek v futlyare* (1898; *A Man in a Case*), *Dushechka* (1898; *The Darling*), *V ovrage* (1900; *In the Ravine*), *Arkhierei* (1902; *The Bishop*), *Nevesta* (1903; *The Betrothed*); as well as in his

four famous plays *Chaika* (1896; *The Seagull*), *Dyadya Vanya* (1897; *Uncle Vanya*), *Tri Sestry* (1900–01; *The Three Sisters*), and *Vishnevy Sad* (1903–04; *The Cherry Orchard*), his training can be seen both in the different types of medical men he introduces and in his attitude to his characters, an objectivity tempered by understanding. Maksim Gorki (1868–1936) was in this respect the opposite of Chekhov, for he was overflowing with pity and compassion, though only for the working classes. Self-educated, and bearing the brunt of the impecunious existence of the Russian worker and artisan, he early threw himself into revolutionary work. His romantic poem in prose, *Pesnya o burevestnike* (1901; *The Song of the Stormy Petrel*), with its refrain: "The Storm! The Storm is about to break!" became a powerful rallying cry of the revolutionary movement. In his first, and most popular, play, *Na dne* (1902; *Lower Depths*), Gorki introduced philosophizing down-and-outs onto the Russian stage. Apart from his early novels—*Foma Gordeev* (1899) and *Mat* (1906; *Mother*)—his most impressive work is to be found in his autobiographical trilogy: *Detstvo* (1913; *Childhood*), *V lyudyakh* (1915–16; *My Apprenticeship*), and *Moi universitety* (1923; *My Universities*).

C. Early 20th Century

1. Symbolism.—It was only at the end of the 19th century that the Symbolist movement brought about a revival of poetry. Among its predecessors were Semen Yakovlevich Nadson (1862–87), Aleksei Nikolaevich Apukhtin (1841–93), and the man who was perhaps more than anyone else responsible for the emergence of the Symbolist movement in Russia, the poet, philosopher, and mystic Vladimir Soloviev (1853–1900), who had apocalyptic dreams and believed in the coming of Antichrist. His poetry expressed the belief that the world is a system of symbols which express the existence of abstract metaphysical realities. Konstantin Balmont (1867–1943) and Valeri Bryusov (1873–1924) were the first considerable Russian Symbolist poets. Influenced by Baudelaire and Verlaine, Bryusov regarded the chief aim of Symbolism as being to present the world in a new light and thus to help to stimulate the imagination. He founded the Symbolist review *Vesy* ("Balance") in 1904. The greatest poet of the movement was Aleksandr Blok (1880–1921). In his first collection of poems, *Stikhi o prekrasnoi dame* (1904; "Verses About a Fair Lady"), he presents an idealized picture of a woman who is the reincarnation of Soloviev's vision of Sophia, Divine Wisdom. He later became disappointed with Soloviev's wild extrasensory fancies, and wrote a series of whimsical poems. In 1918 he wrote *Dvenadtsat* (*The Twelve*), an apocalyptic vision of the Revolution in which 12 Red Army men, personified as the apostles of the new world, are headed by Christ crowned with a wreath of white roses, all marching invisibly through the raging storm. *Skify* (1918; "The Scythians") is a poetic expression of Russia's eternal love/hate for the West. Other important Symbolist poets were Vyacheslav Ivanovich Ivanov (1866–1949), Fëdor Sologub (1863–1927), and Andrei Bely (1880–1934). Ivanov was a Greek scholar who, in his *Kormchie zvezdy* (1903; "Guiding Stars"), proclaimed the identity of Christ and Dionysos. He preached ecstasy for ecstasy's sake, to be found (he claimed) in "symphonic" culture and nonacceptance of the world. Sologub published his first volume of poems in 1896. In 1905 he published his famous novel *Melki Bes* (*The Little Demon*). Bely was the outstanding theoretician of the Symbolist movement, which he conceived as a *Weltanschauung*. His *Simfonie* (1901–02; "Second, Dramatic"), were followed by First, Third, and Fourth "Symphonies." His novels include *Serebryani golub* (1910; "The Silver Dove"), a thriller written in Symbolist terms in which Gogol's influence is paramount, and *Peterburg* (1913), strongly influenced by Dostoevski's *Dvoinik* (*The Double*). Both are in rhythmic musical prose.

2. Futurism.—The most revolutionary poetic movement in Russia, Futurism, was founded in 1910 by Viktor Khlebnikov (1885–1922), an experimental poet, and author of a famous etymological poem consisting of a series of freshly coined derivatives of the Russian word *smekh* ("laughter"). The manifesto announcing the foundation of the movement, also signed by Vladimir Mayakovski (1893–1930), the future Communist "poet laureate," was issued in 1912 under the title *Poshchochina Obshchestvennomu vkusu* ("A Slap in the Face of Public Taste"). The Russian Futurists wanted to scrap the cultural tradition of the past and to wake everybody up by shock tactics. Mayakovski's Futurist poems include *Oblako v shtanakh* (1915; *A Cloud in Trousers*), *Chelovek* (1918; *Man*), and *Voina i mir* (1917; *War and Peace*). He was one of the established writers who rallied to the Soviet regime. In 1918 he wrote *Mystery Buffo*, a verse play prophesying the victory of the Revolution over capitalism. His later satirical plays, *Klop* (1929; *The Bedbug*) and *Banya* (1930; *The Bathhouse*), show signs of disillusionment with Soviet bureaucracy. In 1930 he

SOVFOTO

VLADIMIR MAYAKOVSKI SPEAKING ON "BOOK DAY"; RUSSIA, 1929

committed suicide, leaving a note in which he said: "The boat of love has crashed on the rocks of everyday life," a possible reference either to an unhappy love affair or to his political disillusionment.

Boris Pasternak (1890–1960) also began as a Futurist poet. By 1917 he had published *Poverkh Baryerov* (*Above the Barriers*) and had written most of the poems included in *Sestra moya zhizn* (1922; *My Sister Life*). (D. Mk.)

III. POST-REVOLUTIONARY LITERATURE

1. Early Years (1917–1928).—The years immediately after 1917 were a time of brilliant experimentation in the arts, in response to new forces released by the Revolution. Contending literary groups sprang up. The basic struggle was between those who clung to the literary heritage of the 19th century and those who demanded a new proletarian culture. The Futuristic poetry of Mayakovski and his followers symbolized a formal break with the past, whereas the "peasant-poet" Sergei Esenin (1895–1925) celebrated in lyrics of traditional form the joys of the countryside that would come with the Soviets. Fiction was dominated by stories of violence about the Civil War, told often in crude heroics, as in *Chapaev* (1923; Eng. trans. 1925), the account of a guerrilla leader by Dmitri Furmanov (1891–1926). More sophisticated were the realism and polished technique of the tales of Isaak Babel (1894–1941), about Budenny's Cossack army, in *Konarmia* (1926; *Red Cavalry*, 1929). The degeneration of life during the Civil War is narrated with startling naturalism by Boris Pilnyak (Boris Vogau; 1894–1937?), in *Goly God* (1922; *The Naked Year*, 1928). In contrast, *Razgrom* (1927, "The Rout"; translated as *The Nineteen*, 1929), by Aleksandr Fadeev (1901–56), is written with a realism that compels belief in its guerrilla hero. Konstantin Fedin (1892–), one of the self-styled Serapion Brothers—Trotski called them mere "fellow travelers of the Revolution"—was concerned with the struggle between old and new, especially the tragic problems of intellectuals in adapting themselves to the revolutionary present—the theme of his early novels *Goroda i gody* (1924; *Cities and Years*, 1962) and *Bratya* (1928; "The Brothers"). To a lesser extent these problems also concerned the fellow traveler Leonid Leonov (1899–), and there are echoes of them in his *Barsuki* (1924; *The Badgers*, 1947) and *Vor* (1927; *The Thief*, 1931). Many fellow travelers were influenced by the realism of Tolstoi, Dostoevski, and Chekhov. Yuri Olesha (1899–1960), in *Zavist* (1927; *Envy*, 1936), tackles the conflict of values created by the new society. In the absence of controls satire flourished—for example, in *Rastratchiki* (1926; *The Embezzlers*, 1929), by Valentin Kataev (1897–), an amusing tale of two crooks who exploit the foibles of Soviet life; and in sketches by Mikhail Zoschenko (1895–1958), which poke fun at Soviet stupidities. These authors were among the best in this period, which promised a glowing future for literature.

SOVFOTO

ISAAK BABEL

2. Five-Year-Plan Literature (1928–1934).—So bitter became the struggle between the fellow travelers, who demanded creative self-determination, and the left-wing writers, who argued for proletarian literature subservient to the Communist Party, that the Central Committee decreed, in its "Literary Manifesto" (1925), that the party would not endorse the work of any one group. However, when the first five-year plan was launched (1928), the party, determined that all cultural endeavours must support it, backed the Russian Association of Proletarian Writers (RAPP), an outgrowth of the Proletkult (a group formed soon after the Revolution to foster specifically proletarian culture), and other left-wing groups. This enforced concentration on themes of construction and collectivization had been anticipated by Fedor Gladkov (1883–1958) in his popular novel *Tsement* (1925; *Cement*, 1929). Almost the only memorable work to emerge from this "social-command" fiction was *Podnyataya tselina* (1932–60; translated in two parts as *Virgin Soil Upturned*, 1935 [U.S. title, *Seeds of Tomorrow*], and *Harvest on the Don*, 1960), by Mikhail Sholokhov (*q.v.*; 1905–). The hero, Davidov, is believable because his failures in organizing a collective farm are described as convincingly as his successes. Kataev treats the theme of construction more lightly in *Vremya, vpered!* (1932; *Time, Forward!* 1933), but Pilnyak's *Volga vpadaet v Kaspiskoe more* (1930; *The Volga Falls to the Caspian Sea*, 1931) introduces a critical note on the inhuman strains involved in these vast building projects. In Leonov's *Sot* (1930; Eng. trans. *Sot*, 1931, and *Soviet River*, 1932) and *Skutarevski* (1932; Eng. trans. 1936), however, the frenzy of industrialization is sublimated in psychologically probing characters confronted with real choices in submitting to social commands. Though there was much five-year-plan poetry and drama, not even the best rose above effective propaganda.

SOVFOTO

MIKHAIL SHOLOKHOV, PHOTOGRAPHED IN HIS STUDY IN 1960

3. Socialist Realism (1934–1941).—In 1932 a decree of the Central Committee abolished RAPP. By this time the party, under Stalin, felt able to control literature more effectively by another device. The decree suggested that all literary groups dissolve and form a single union with a dominant party faction therein. At the First All-Union Congress of Soviet Writers (1934), a national Union of Soviet Writers was organized, and the new doctrine of "socialist realism" propounded to guide creative efforts. Literature became identified with politics and the party's ideological objectives. Though the union's powers enabled it to whip recalcitrant members back into the happiness of conformity, some tolerance was permitted during this period of economic successes and "popular-front" agitation. The ablest writers took advantage of this. Melekhov, hero of Sholokhov's great epic novel, *Tikhii Don* (1928–40; translations of volumes i and ii, *And Quiet Flows the Don*, 1934; continued in *The Don Flows Home to the Sea*, 1940), remains at the end a tragic, unreconstructed "White" Cossack, and the spirit of the work is out of step with socialist realism. Kurilov, in Leonov's complicated *Doroga na okean* (1935; *Road to the Ocean*, 1944), is a humanized Communist whose dedication to the cause is saddened by memory of joyless sacrifices. Even Fedin's interesting *Pokhishchenie Evropy* (1934–35; "The Rape of Europe"), in which he attempts to identify himself with the party's aspirations, reveals distaste for its extravagantly propagandized claims. But the trilogy *Khozhdenie po mukam* (1920–41; "The Way Through Hell"; translated as *Road to Calvary*, 1946), by A. N. Tolstoi (1883–1945)—a picture

SOVFOTO

(LEFT) KONSTANTIN FEDIN; (RIGHT) LEONID LEONOV; BOTH PHOTOGRAPHED IN MOSCOW, 1962

of intellectuals during the Revolution and Civil War—betrays that the author's values have been transformed by political expediency during the period of its composition. It remained for Nikolai Ostrovski (1904–36), in *Kak zakalyalas stal* (1932–34; *How Steel Was Tempered,* 1952), to create in literature the "new Soviet man," an idealized Communist paragon. Most writers conformed to the spirit of Ostrovski's "classic"—novelists such as Kataev, Ilya Ehrenburg (1891–), and Fadeev; poets such as N. N. Aseev (1889–1963), N. S. Tikhonov (1896–), and A. T. Tvardovski (1910–); and dramatists such as A. N. Afinogenov (1904–41), V. M. Kirshon (1902–37), and Nikolai Pogodin (N. F. Stukalov; 1900–64). The party required "positive heroes" and optimistic themes that romanticized the heroic efforts to achieve Communism. Literary critics, who earlier had developed such brilliant schools as Formalism, now imitated one another in insistence on the party's version of socialist realism. Some authors were "liquidated" in Stalinist purges, and others, among them Anna Akhmatova (*q.v.;* 1889–1966), a major poet of exquisite skill, Pasternak (*q.v.;* 1890–1960), perhaps the most celebrated Soviet poet, Fedin, Leonov, and Sholokhov, fell virtually silent. Some escaped into historical fiction, although its vogue had begun earlier. Often these historical novels are based on careful research, but they usually stress a Marxian interpretation of history. Two of the best were *Tsushima* (1932–35; Eng. trans. 1936), by Aleksei Novikov-Priboi (1877–1944), and A. N. Tolstoi's *Pyotr I* (1929–45; *Peter I,* 1959).

SOVFOTO

ALEKSEI TOLSTOI

4. War Literature (1941–1945).—During World War II writers shared the fervent national patriotism; many were assigned to the front as correspondents. The party relaxed its controls and authors felt free to concentrate on the human fundamentals and universal emotions evoked by the tragedies of war. There was little time for lengthy fiction—among the few novels the most popular were a tale of German invaders in the Kuban, *Nepokorennye ili Semya Tarasa* (1943; *The Taras Family,* 1944), by Boris Gorbatov (1908–54); a story of the siege of Stalingrad, *Dni i nochi* (1944; *Days and Nights,* 1945), by Konstantin Simonov (1915–); Leonov's *Vziatie Velikoshumska* (1944, "The Taking of Velikoshumsk," trans. as *Chariot of Wrath,* 1946); and Fadeev's *Molodaia gvardia* (1945; *The Young Guard,* 1959), an account of the underground activities of members of the Young Communist League under German occupation. However, a stream of short stories and sketches on war themes appeared, as did a number of war plays. The best of the plays were Leonov's *Nashestvie* (1942; *Invasion,* 1945) and *Lyonushka* (1943), but in popularity these gave way to the sensational exposure of Red Army weaknesses in *Front* (1942; *The Front,* 1943), by Aleksandr Korneichuk (1910–), and Simonov's *Russkie lyudi* (1942; *The Russians,* 1944). It was in poetry that the theme of war found its most genuine expression. The finest lyrics were written by Pasternak, Olga Bergolts (1910–), Margarita Aliger (1915–), and Simonov. Perhaps the best long poems were Tvardovski's *Vasili Terkin* (1941–45), Nikolai Tikhonov's *Kirov s nami* (1941), about the siege of Leningrad, and *Pulkovo Meridian* (1942), by Vera Inber (1890–).

5. Zhdanovism (1945–1953).—The writers' hope that the party would continue and perhaps enlarge the creative freedom enjoyed during the war was squelched by the Central Committee's decree on literature (Aug. 14, 1946). The Politburo's literary "expert," A. A. Zhdanov, explained that all art must be politically inspired and understood. Though socialist realism would remain the writer's credo, its principal tenet must be *partiinost* ("party spirit"). The party publicly identified itself as never before with domination of all artistic and intellectual expression. The word "Zhdanovism"—as the new policy was called—describes also this most sterile period of Soviet literature. The party expected writers to concentrate on postwar reconstruction, rehabilitation of returning soldiers, and hostility to Western Europe and the United States. Some authors took refuge in war themes, on which many novels are based, notably *Povest o nastoyashchem cheloveke* (1947; *A Story About a Real Man,* 1949), by Boris Polevoi (Boris N. Kampov; 1908–); Ilya Ehrenburg's *Burya* (1948; *The Storm,* 1949); Kataev's *Za vlast sovetov* (1949; "For the Power of the Soviets"); and *Belaia bereza* (1948; *The White Birch,* 1949), by Mikhail Bubonnov. Others were concerned with wartime industrial activities—*e.g.,* Vera Panova's *Kruzhilikha* (1947; *The Factory,* 1949) and Vasili Azhaev's *Daleko ot Moskvy* (1948; "Far from Moscow"). But the official demand for literature dealing with peaceful reconstruction was complied with in such novels as Pyotr Pavlenko's *Schastye* (1947; *Happiness,* 1950) and Semen Babaevski's *Kavaler zolotoi zvezdy* (1947; "Cavalier of the Golden Star"). Towering over this fiction is Fedin's trilogy, perhaps the best postwar novel. The first two parts, *Pervye radosti* (1945–46; *Early Joys,* 1948) and *Neobyknovennoe leto* (1948; *No Ordinary Summer,* 1950), which are superior to the third part, *Koster* (1962; "The Bonfire"), tell the story of the young revolutionary Kirill Izvekov during the years 1910–19. But with a few exceptions, the postwar "grey stream of colourless, mediocre literature," as Sholokov called it, has the uniformity of the dead in a cemetery.

6. The Thaw (1953 and After).—Even before Stalin's death in March 1953, articles critical of literature's stagnation had appeared, and after it they increased in number and sharpness. This protest was quickly reflected in creative writing. Leonid Zorin's play, *Gosti* (1954; "The Guests"), challenged the party's claim that the class structure had vanished. Though Leonov's *Russkii les* (1953; "Russian Forest") treats a contemporary theme in a propagandist manner, the finest things in it belong to the sections dealing with pre-Revolutionary Russia. Poets such as Vera Inber and Olga Bergolts attacked the "steam-shovel" school of verse and the writing of lyrical poems devoid of personal emotion. Pasternak, who had published no original verse since the war, brought out, in the April 1954 issue of the periodical *Znamya,* a group of ten deeply subjective poems which later appeared in the novel *Doktor Zhivago* (1957). But the work that gave a name and focus to the dissent was Ehrenburg's *Ottepel* (1954; *The Thaw,* 1955), in which he highlighted the tragedy of the artist under Stalinism. Worried party leaders called a halt, and, at the Second Writers' Congress (December 1954), offending authors and critics were reprimanded, and it was made clear that ideological orthodoxy was preferred to aesthetic merit. However, Khrushchev's "secret" speech at the 20th Party Congress (1956), in which he exposed Stalin's crimes and the "cult of personality," revived the protest against literary controls. During 1956 and part of 1957 some of the best writing, especially by younger authors, represented an indictment not only of the abuses of Stalinism but of the abuses and hypocrisy in Soviet life. Vladimir Dudintsev's *Ne khlebom edinym* (1956; *Not by Bread Alone,* 1957), whose hero fights a lonely battle against dishonest party officials, was one of many revelatory works. This bold effort reached its height in the second volume of the anthology *Literaturnaia Moskva* (1956), in which poetry, fiction, and criticism attacked the ugly aspects of Soviet existence and questioned the omniscience

of the party. What seemed like an organized attack on authority took on added significance in light of the 1956 Hungarian revolt. The party swung into action. Administrative bodies of the Writers' Union demanded recantations from authors, who were also excoriated in the party-controlled press. These efforts culminated in speeches by Khrushchev in the summer of 1957, in which he emphasized the primacy of party guidance in the arts. Publication of Pasternak's *Doktor Zhivago* in Italy (1957), and elsewhere in Western Europe in 1958, provoked another outburst of denunciation. Though Khrushchev made mollifying gestures at the Third Congress of the Union of Soviet Writers (May 1959), he again reminded them that they must "continue to be active helpers of the party and government in the task of communist education of workers. . . ." After this, writers continued to press, less overtly, for greater freedom of expression. With the rise of the so-called angry young men, of whom the much-publicized poet Evgeni Aleksandrovich Yevtushenko (1933–) is only one, a "liberal" faction began to demand that the pace of "de-Stalinization," of telling the whole truth about Russia, be speeded up.

This faction was opposed by the "conservatives," and the struggle came to a head at the Fourth Plenary Session of the Board of the Writers' Union, held in March 1963, in which leaders among the "liberal" group were forced to recant. After the fall of Khrushchev in October 1964, published statements indicated that the party under its new leadership would continued to insist on the identification of literature with party ideology, although within a framework in which more freedom would be allowed in matters of form and content. In this spirit the new liberal generation strove to achieve an individualism in literary expression alien to socialist realism. The most talented of the prose writers among them were Aleksandr Solzhenitsyn, Viktor Nekrasov, Yuri Kazakov, Vasili Aksenov, Yuri Nagibin, and Vladimir Tendryakov; the most able of the poets were Evgeni Yevtushenko, Andrei Voznesensky, Evgeni Vinokurov, and Bella Akhmadulina. But this degree of nonconformity to party dictation in literature received a setback in February 1966 when two minor writers, Andrei Sinyavski and Yuli Daniel, were sent to prison for publishing abroad (under the pseudonyms Abram Tertz and Nikolai Arzhak) works allegedly slandering the Soviet Union.

RUSSIAN REVOLUTION, the historical events whereby, between 1917 and 1921, control of the major part of the former Russian Empire was taken over by a Soviet Communist dictatorship. The article RUSSIAN HISTORY ends with an account of the collapse of the tsarist or imperial regime of the Romanovs, during World War I, in the March Revolution of 1917—known to Russian writers as the February Revolution because the Russian calendar observed the Old Style till Feb. 14, 1918. The present article describes how the Provisional Government, set up by the March Revolution, was overthrown eight months later in the November Revolution—or Great October Socialist Revolution—of the Bolsheviks or Communists; and how the power of the latter was consolidated, despite internal resistance and foreign intervention, in the following years.

The article is composed as follows:

1. March 1917
2. Lenin's Arrival in Petrograd
3. Marxist Doctrines of Revolution
4. Lenin and the Soviets
5. The April–May Crisis
6. The Soldiers' Committees
7. Kerenski and the Summer Offensive
8. The July Demonstrations
9. The Nationalities and the Provisional Government
10. The Moscow State Conference
11. Kornilov's Rebellion
12. The November Revolution
13. The First Soviet Government
14. The Bolsheviks and the Nationalities
15. The Constituent Assembly, Jan. 18–19, 1918
16. The Treaties of Brest-Litovsk
17. The Loss of Bessarabia
18. Ukraine and Transcaucasia, Spring–Summer 1918
19. The Outbreak of Civil War: Intervention and Terrorism
20. The All-Russian Directory and Kolchak
21. War in Ukraine, Winter 1918–19
22. The Allies' Dilemma
23. The Defeat of the Whites, 1919–20
24. The Russo-Polish War and the Baltic States
25. Transcaucasia Reconquered, 1920–21
26. The Far Eastern Settlement, 1922
27. Trotski and War Communism
28. The Kronstadt Mutiny, 1921
29. The 10th Congress and Lenin's Dictatorship

1. March 1917.—In Petrograd, the Russian capital, there were in March 1917 two separate authorities, both claiming to speak for the people, but neither of them representing more than a section of it: the Provisional Government and the Soviet (council) of Workers' Deputies. The former had been chosen on March 15 (N.S.) by the members of a duma (*q.v.*) elected four years earlier on a restricted franchise. Its leaders reflected the point of view of the more conservative and patriotically minded members of the professional classes, though in A. F. Kerenski (*q.v.*), a lawyer of Trudovik (Labour) opinions, they had a representative of moderate socialism. The soviet represented primarily the working class of the capital, but could in a wider sense speak for the industrial workers of all Russia; and, as its ranks were swollen by the arrival of socialists released from prison or returned from exile, it became a sort of parliament of Russian socialism, from the Socialist-Revolutionaries (S.R.) to the Bolsheviks.

A fundamental question facing the new regime was that of legitimacy. The old legitimacy of the monarchy had been destroyed. It could be replaced only by the legitimacy of the will of the whole people of Russia, but this could be ascertained only by an elected Constituent Assembly. To hold such an election while Russia was at war with Germany, Austria-Hungary, and Turkey (*see* WORLD WAR I) seemed hardly possible, both because it would divert energies from the war effort (and the first Provisional Government was eager to win the war) and because so many citizens were away in the army. The men of the Provisional Government were high-minded democrats who would be content with nothing less than a completely free and comprehensive election and were willing to wait for the end of the war, if need be, to have one. Their perfectionism was disastrous. An election held forthwith would have caused less chaos than occurred later without it, and would have created an imperfect but substantial democratic legitimacy. As things were, there was no legitimacy. The Provisional Government was left in the air, and found itself acting as if it were responsible to the Petrograd Soviet.

The most important problem was whether to continue the war or, if not, how to get out of the war. The foreign minister, P. N. Milyukov (*q.v.*), a convinced patriot, believed that the war was just, that it was being fought to liberate the peoples oppressed by Austria-Hungary and by Turkey, and that Russia should be rewarded by acquiring Constantinople, the Straits, and Turkish Armenia. The socialists, however, were not interested in these aims and believed that the war should be ended "without annexations and without indemnities." But there was no evidence that the German government would grant a just peace simply because the revolutionary Russians recited peaceful slogans. Until the Germans were willing to make peace the Russian fatherland had to be defended. And in any case the new Russian leaders admitted that they could not make peace without their allies' consent.

It has often been argued by historians of a later epoch that the Western Allies were foolish not to have agreed to release Russia from its obligations. But at the time it was inconceivable that the Western governments should do so. The release of the German divisions held on the Russian front might have made it possible for Gen. Erich Ludendorff finally to crush the West, and to the Western Allies defeat by Germany understandably appeared the worst disaster that could befall them.

It followed that the war must continue. And if it were accepted that a Constituent Assembly could not be elected while the war went on, it followed that various problems which could be decided only by such an assembly must remain for the time being unsolved. First among these was the redistribution of the landed estates among the peasants. Second was the claim of the non-Russian subjects of the empire for self-government (in the case of Poles and Finns perhaps for complete independence). Third were various demands which might be put forward on behalf of the industrial workers, such as "workers' control" in the factories, or even nationalization of some enterprises or some branches of industry. But as long as these problems remained unsolved, the discontent of land-hungry peasants, non-Russian nationalists, and miserably paid workers grew. Meanwhile the Provisional Government had to rely on the old imperial bureaucracy, which was ever more demoralized. The lack of legitimacy made it difficult either to give or to carry out orders. For the two years past, Russia had lacked firm leadership at the top, but now the machinery of government was breaking down on lower levels as well. It was a perfect opportunity for an uninhibited revolutionary demagogue.

2. Lenin's Arrival in Petrograd.—A revolutionary of genius appeared when on April 16 (new style; 3, old style), 1917, V. I. Lenin (*q.v.*) arrived in Petrograd from Switzerland. With a group of 200 Russian émigrés, including L. Martov and other Mensheviks, this leader of the Bolsheviks had journeyed to Russia across Germany, Sweden, and Finland. The German general staff, which reckoned that Lenin's defeatist activities in Russia would be to the Central Powers' advantage, authorized this passage. Lenin, of course, was no agent of the Germans, but there is evidence that in the following months his party received financial aid from the German authorities. This it badly needed in order to organize its propaganda.

Lenin introduced a new note into the Petrograd Soviet. He at once urged a policy of complete opposition to the Provisional Government. He said the party should demand immediate peace and immediate distribution of land to the peasants and should declare that it had no confidence in the Provisional Government. Lenin announced the slogan "All power to the soviets."

3. Marxist Doctrines of Revolution.—All Russian Marxist Socialists—Bolsheviks and Mensheviks alike—had long maintained that the next revolution in Russia would be a "bourgeois revolution," which would do for Russia what the Revolution of 1789 had done for France, and would replace the semi-autocratic tsarist regime by a "bourgeois" democratic republic. Normally it would be expected that a bourgeois revolution would be carried out by the bourgeoisie. But Lenin held that the experience of 1905 had shown that the Russian bourgeoisie was incapable of carrying out any revolution: it was too weak, too cowardly, too reactionary,

and it lacked awareness of its "historical function." The "bourgeois" revolution must therefore be carried out by the working class, or rather by the "vanguard" of the working class, "its own" political party, that is, the Bolshevik Party led by Lenin. The party was to lead the workers, and the workers were to lead the peasant masses into action and to form a "revolutionary democratic dictatorship of the proletariat and peasantry."

Lenin had first expounded these views in a pamphlet, *Two Tactics for Social-Democracy in a Democratic Revolution,* in 1905. They had been rejected by the Mensheviks, who stuck to the more orthodox opinion that bourgeois revolutions were to be carried out by the bourgeoisie. Neither Lenin nor the Mensheviks expected a socialist revolution immediately. Socialist revolution, according to Marxist doctrine, was a much more advanced stage, when the proletariat would overthrow the bourgeois regime. Before this could happen, the proletariat must grow stronger, more numerous, more skilled, and politically more conscious, and the class struggle must develop freely within the framework of a democratic republic. In this connection Lenin paid great attention to the role of the poor peasants. He believed that only when the great landed estates had been divided up among the peasants, and the peasants had been freed from the last remnants of subordination to the landed nobility, would it be possible for a rural class struggle freely to develop, as rural bourgeoisie and rural proletariat became more sharply differentiated. The rural proletariat would be the ally of the urban proletariat when the time came for socialist revolution. How long would be the interval between the bourgeois and socialist revolutions, neither Lenin nor the Mensheviks could predict.

There was, however, another Russian Marxist who had a somewhat different view. L. D. Trotski (*q.v.*) agreed with Lenin that the bourgeois revolution had to be made by the party of the proletariat, but he did not agree with Lenin that once the workers had made a revolution, they could impose on themselves a self-denying ordinance and deliberately maintain things at the stage of a bourgeois republic, ruled in the interests and according to the ideas of the bourgeoisie. They would have to go on to set up a socialist regime. But in so backward an agrarian society as Russia, socialism was not possible unless socialist revolutions at once took place in at least one major industrial country in Europe. The best hope for the Russian revolution, as Trotski saw it, was that the action of the Russian workers would provide the spark to set off the European revolutionary conflagration.

Lenin, too, even before 1917, had recognized the importance of European revolutions, but he believed that, if necessary, a worker-peasant dictatorship led by his party could keep Russia at the stage of a bourgeois republic. He now regarded the March Revolution as a bourgeois-democratic one, which had gone beyond the framework of a bourgeois revolution and had led to the establishment of soviets as organs of the revolutionary and democratic dictatorship of the proletariat and peasantry. The Provisional Government, he argued, was the organ of the bourgeoisie and the bourgeois revolution, while the Petrograd Soviet and the soviets which soon sprang up in other cities were the organs of the proletariat and of the socialist revolution. The dual power would not last: either the bourgeois revolution would suppress the socialist, or the socialist revolution would triumph over the bourgeois. This theoretical change of opinion was remarkable, considering that the conditions previously thought necessary for the transition from the bourgeois to the socialist revolution had not yet been fulfilled: the working class was not much stronger or more numerous than in 1905, and the redistribution of land which Lenin had believed necessary for the development of the peasants' class struggle had not yet gone very far, as the effects of the tsarist statesman P. A. Stolypin's land policy were only beginning to be felt. On the other hand, it might be argued that after three years of war the discontent of the European working classes was such that the prospects of socialist revolution in Europe had increased in comparison with 1905.

4. Lenin and the Soviets.—Theoretical analysis was only partly responsible for Lenin's decisions. Lenin was a man of action and a natural leader, at his best in a time of crisis and chaos. He wanted power, and he now saw a way to win it. In a bourgeois republic, with a parliamentary system of government, his prospects would not be good. Parliamentary governments would be formed by agreements between party leaders, whose ideas were already formed, and the parties' representatives in the parliament would form disciplined groups. In such conditions, the Bolsheviks would have to bargain and compromise with the other parties if they wished to take part in government coalitions, or they would be driven into ineffective opposition. They could not hope to win an absolute majority in a Russian parliament.

The soviets, on the other hand, were a very different forum. Their members were not trained politicians, but the masses from the factories and—with the addition of "soldiers' deputies" to the "workers' deputies"—from the armed forces. Through the soviets, for the first time, the masses were being brought into political life—the raw material to be molded by an audacious leader. In the soviets, votes were taken not according to fixed party allegiances but according to the momentary passions of the workers and soldiers. Socialist-Revolutionaries, Mensheviks, and Bolsheviks were represented, but they could not count on any automatic discipline. Oratory and propaganda could sway them to and fro. Here was Lenin's opportunity. The greater the authority given to the soviets, the better his chances of seizing power. Hence his slogan "All power to the soviets."

In the soviets the Bolsheviks were at first a small minority. But once Lenin had converted his party to his views (which needed some days of hard arguing), the Bolsheviks in the soviets adopted unrestrainedly demagogic slogans. They stood, they said, for peace at once, land reform at once, workers' control of the factories at once, self-determination for the non-Russian peoples at once. If the Provisional Government's spokesmen declared that these things could not be done at once and that they were the task of the future Constituent Assembly, then this, Lenin claimed, was proof that the Provisional Government intended to prevent these things from ever being done, proof that its leaders were enemies of the Russian workers and peasants and were mere agents of French and British capitalists and imperialists.

5. The April–May Crisis.—The first crisis of the Provisional Government came at the end of April 1917, on the war issue. Milyukov, the foreign minister, not only reassured the Western Allies that Russia would continue the war on their side, but, in a press interview on April 5 (N.S.), declared that Russia's war aims included annexation of the Ukrainian provinces of Austria-Hungary, and of Constantinople and the Straits. On April 9 the Petrograd Soviet issued a declaration that Russia sought no gains from the war and was ready to conclude peace on the basis of "no annexations, no indemnities." The members of the government were not in fact agreed on these problems. An attempt was made to bring about a compromise between Milyukov and the soviet by a

government declaration of April 22 which described Russia's aim as "the establishment of durable peace on the basis of national self-determination." The soviet insisted that the text of this declaration be officially handed to the Allied governments. Milyukov on May 1 transmitted the text, but with a covering note in which he stated that Russia remained faithful to wartime agreements and intended to pursue the war to victory. When the covering note became known to the soviet, it was naturally understood as a direct challenge.

The leaders of the soviet organized mass demonstrations against war and Milyukov. The result was that he and the minister of war, the Octobrist leader A. I. Guchkov, resigned on May 15, and a new coalition was formed, including the Socialist-Revolutionary leader V. M. Chernov and the Menshevik I. G. Tsereteli. The April–May events were important not only because the right wing of the Provisional Government was forced out of power, but because they showed that the government was being forced in effect into a position of responsibility to the soviet.

6. The Soldiers' Committees.—In the meantime the discipline of the army was collapsing. This was of course due, above all, to the losses and sufferings of three years of war, the deterioration in the quality of officers, and the continuing supply difficulties. But defeatist propaganda and interference by the revolutionary parties also played an important part. On March 15 the Petrograd Soviet had issued its Order No. 1 to the Army. This laid down that the soldiers should elect committees in their units, from which in turn deputies should be elected to the soviet. The committees should have political authority over the soldiers, while the officers' authority should be limited to strictly professional matters. The committees should have control over the arms of the units and should not give them up to officers on demand. This fantastic arrangement was not put fully into effect, but elected committees of soldiers spread to units both in the rear and at the front, and the political commissars elected by the committees were in fact a challenge to the authority of officers.

Not all committees or commissars were defeatist. Indeed in many cases the committees were welcomed by the officers, as a means of raising the morale and restoring the determination of their men. Many of the commissars considered it their patriotic duty to defend the revolutionary fatherland and believed that, now that Russia belonged to all its sons instead of to the tsar, they would fight with renewed vigour.

7. Kerenski and the Summer Offensive.—Kerenski, who became minister of war in the coalition of May 18, 1917, believed in fighting on for the new Russia. He hoped to make the soldiers' committees an instrument for increasing the efficiency of the Russian Army, and did his best to strengthen their efforts by speeches of fiery eloquence during his visits to the front. But the parties of the extreme left were resolved that the committees should be instruments of defeatism. Bolshevik propaganda at the front, by word of mouth and by the newspapers which they distributed in profusion, was especially active. Kerenski, however, believed the Army capable of a new offensive, for which the Western Allies were clamouring. The offensive opened on July 1 in Galicia. After small initial successes, it came to a standstill, and two weeks later the enemy counteroffensive drove the Russians back in confusion. Many units simply refused to fight.

8. The July Demonstrations.—In June 1917 the first All-Russian Congress of Soviets was held in Petrograd, with soldiers' as well as workers' deputies present. Only about one-eighth of those attending declared themselves for the Bolsheviks. But at a mass demonstration held by the moderate leaders of the Petrograd Soviet on July 1 as a sign of the unity of the "revolutionary democracy," the Bolsheviks turned out in force with banners calling for an end to the war and a cessation of offensive movements on the front. Two weeks later, on July 16–17, vast demonstrations took place in the capital, amounting to an insurrection against the government. The crowds included workers, soldiers, and a contingent of sailors from the naval base of Kronstadt (Kronshtadt). The Bolsheviks had not planned this insurrection, but assumed leadership of it once it had started. For two days the demonstrators were in control of the capital. Chernov narrowly escaped being lynched. But the crowd made no determined effort to occupy government buildings, nor did the Bolshevik leadership wish a premature rising. At the end of the second day the crowd drifted away.

The government made some effort to take action against the Bolsheviks. Lenin went into hiding in Finland. Documents (most probably forgeries) were published in the press which purported to prove that Lenin was a German agent. For a time the Bolsheviks lost ground in the soviets. On July 21 the government was reorganized, and Kerenski became prime minister.

9. The Nationalities and the Provisional Government.—Meanwhile the nationalist movements among the non-Russians were growing. The main Ukrainian nationalist organization was the Society of Ukrainian Progressives, a moderate socialist group headed by the leading Ukrainian nationalist intellectual figure, the historian Myhaylo Hrushevsky (*see* UKRAINIAN SOVIET SOCIALIST REPUBLIC). On March 17, 1917, it took the initiative in summoning a Ukrainian central council, the rada, in Kiev. The rada's aims were at first strictly cultural, but soon it put forward demands for political self-government. During the early summer

congresses were held of Ukrainian peasants, soldiers, and workers, and three political parties emerged—Ukrainian Socialist-Revolutionaries, Ukrainian Social Democrats, and Socialist-Federalists—all of which stood for some form of national autonomy. The rada was enlarged to include representatives of these forces, and in May it sent a delegation to Petrograd to ask for recognition of its claims.

The Provisional Government refused to regard the rada, which had not been regularly elected by popular suffrage, as representing the people of the Ukraine, and insisted that the question of any future Ukrainian autonomy could be decided only by the All-Russian Constituent Assembly. On June 23 the rada issued a solemn proclamation, the "First Universal" (the name is taken from the proclamations issued by the hetmans of the Ukraine in the 17th century), declaring its intention to organize a system of democratic government for the Ukraine, but recognizing that this would later have to be confirmed by the Constituent Assembly. It also set up an executive authority called the General Secretariat, a rudimentary cabinet of the Ukraine. On July 12 Kerenski and two other ministers went to Kiev for further discussions. These resulted in the issuance of a "Second Universal," the text of which represented no more than a verbal agreement. However, such power as existed in the increasing chaos was in the rada's hands.

The Provisional Government in March had already repealed all legislation incompatible with the Finnish constitution, promised to extend Finland's autonomy, and ordered the Finnish Diet to be summoned. In the diet the strongest party was the Social Democrats, who desired independence and showed little patience with the Petrograd government's scruples about a Constituent Assembly. In the Baltic provinces Estonian, Latvian, and Lithuanian nationalist movements gathered strength, while the local Germans were divided between loyalty to Russia and hopes of German victory in the war. In Transcaucasia the Armenians remained loyal to Russia, and the Georgian Mensheviks, the strongest party in their country, insisted on loyalty to the Russian republic which the Constituent Assembly was expected to proclaim.

The Muslim peoples also made their feelings known. On May 14 the first All-Russian Muslim Congress was held in Moscow. There was a division of opinion between the people of the borderlands (Central Asia and Azerbaijan), who wished for territorial self-government within a Russian republic, and the Tatars of the Volga, who, being geographically more scattered, preferred to have a central administrative organ for all the Muslims of Russia and to be directly represented in the Russian government. This notion was disliked by the border peoples not only because they wished their own lands to be autonomous but also because they suspected the Tatars of aiming at a privileged status for themselves. The congress adopted the autonomists' point of view by a substantial majority. It also set up a Muslim National Council, the Shuro, in Petrograd to put Muslim views before the government. Its hopes of obtaining a ministerial post for one of its members, however, were disappointed.

10. The Moscow State Conference.—To reinforce his authority by the support of some sort of representative body, Kerenski convened in Moscow, from Aug. 25 to Aug. 28, 1917, a State Conference, composed of members of the four dumas and representatives of soviets, local government authorities, trade unions, business interests, and the professions—numbering in all nearly 2,500.

The point that most clearly emerged from this conference was the sharp division on the conduct of the war. The parties of the left at the conference continued to demand peace without annexations and without indemnities, but admitted that the country had to be defended until peace was obtained, and put their faith in further "democratization of the army" and further proliferation of committees and commissars. The Bolsheviks, who were not represented at the conference, continued to demand immediate peace and to denounce all other parties as warmongers and agents of the Western Allies.

On the other hand were the forces that believed in a restoration of old-fashioned military discipline. This new formation of the right consisted mainly of persons who a year earlier would have been considered to be on the left, persons with a radical or liberal political background. They were not reactionaries in the sense of wishing to return to the past; they were certainly not monarchists. They believed in a democratic Russia, but they insisted that it must be defended. The difference between them and the non-Bolshevik left was that national defense seemed to them the most urgent task, the precondition for the internal social reforms, many of which they accepted as necessary, though of course they were less radical in this respect than the left.

11. Kornilov's Rebellion.—The most effective spokesman of the new right was Gen. L. G. Kornilov (*q.v.*), an officer of humble origin, son of poor Cossack parents, basically ignorant of politics but certainly no admirer of Nicholas II. Impressed by his military record and his personal qualities, Kerenski had on Aug. 1, 1917, appointed him commander in chief. For a time these two tried to cooperate, each believing that the other was necessary to the salvation of Russia. But at the Moscow State Conference the relations between them, and the profound hostility between the political groups which looked respectively to each of them as leader, became clear. On Sept. 3, 1917, the Germans occupied Riga, and Petrograd itself appeared to be in danger. This intensified the urgency of more efficient military command, and Kornilov became convinced that he must assume control of the civil government as well as of the army. Kornilov was surrounded by a number of right-wing politicians, whose clumsy efforts to obtain Kerenski's support for the proposed military *coup d'état* only brought about a complete breach between the two.

On Sept. 9 Kerenski denounced Kornilov as a traitor and relieved him of his command. Kornilov replied by sending a cavalry corps against the capital. Kerenski appealed to the soviets and the workers to defend the revolution. This provided the Bolsheviks with an excellent opportunity to put themselves at the head of the resistance. When the troops reached the outskirts of Petrograd they were met by delegates of the soviets who harangued them with revolutionary appeals. The morale of the troops was low and they had no desire to fight their own countrymen; they therefore submitted to the Provisional Government. Their commander, Gen. A. M. Krymov, committed suicide, and Kornilov himself, who had remained at his headquarters at the front, was arrested. On Sept. 14 (N.S.; 1, O.S.), Kerenski proclaimed Russia a republic.

The Kornilov rebellion was a defeat for the right, but it was no victory for Kerenski. Those who gained were the Bolsheviks, who had always argued that Kerenski and the moderates were incompetent to defend the revolution, and who themselves had played a large part in the defeat of Kornilov. Bolshevik prestige had never been so high among the working class of Petrograd and among the ranks of the military forces in the capital. By mid-September the Bolsheviks had a majority in the soviets of both Petrograd and Moscow. Lenin, still in hiding, decided that the time had come to seize power, and urgently exhorted the party, by correspondence from Finland, to prepare for insurrection. At the 6th Congress of the Bolshevik Party, held in Petrograd early in August, the intention to seize power, regardless of the formal majority in the soviets, had already been asserted. The loss of Bolshevik popularity in the soviets, as the result of the July demonstrations and the charge of serving the Germans, had not deterred Lenin from his aim. Now that the Bolsheviks were once more popular, the arguments for action were further strengthened. The party leaders were, however, divided. G. E. Zinoviev and L. B. Kamenev (*qq.v.*), two of the most eminent, were opposed to early action. On the other hand the able recruit, Trotski, who had brought his own faction into the Bolshevik ranks, strongly supported Lenin and began active preparations.

The Kornilov rebellion was a turning point of the Russian Revolution. It is essential to note that the struggle was between not two forces, but three. These were the right (conservatives, liberals, and Russian patriots), the left (moderate socialists, from the right wing of the Socialist-Revolutionaries to the left wing of the Mensheviks), and Lenin. The struggle that impressed politically minded people in Russia and observers of the Russian scene abroad was that between the first and the second. Both sides in this struggle underestimated the Bolsheviks. To Kornilov, the real enemy was socialism, personified in Kerenski. The socialists, to him and his friends, appeared a gang of cosmopolitan anarchists

(Left) General disorder ensues as Leninists beslege the duma of the Provisional Government in 1917; (above) guarding the soviet, 1917

who were ruining Russia—at best, undisciplined and dangerous utopians, at worst, traitors to their country. To Kerenski, conversely, Kornilov and his supporters represented counterrevolution, the bloody repression of the working masses by incorrigibly reactionary militarists, and the denial of all the ideals of liberty and justice for which the Revolution stood. The image which each side had of the other may have been distorted and unjust, but there could be no doubt of the profound and sincere conviction of each.

Lenin was underrated by both the contending groups. To Kerenski, Lenin was another revolutionary, misguided and fanatical and perverse perhaps, but still on his side of the barricade. The whole tradition of the revolutionary movement made it impossible for Kerenski to compare Lenin with Kornilov; and he had shown long forbearance toward Lenin's provocative action before ordering his arrest. But Lenin himself was completely free from revolutionary sentimentality. To him, Kerenski was every bit as much an enemy as was Kornilov or Nicholas II. Unshakably convinced that he and his party held a monopoly of revolutionary wisdom and that they embodied the will of the revolutionary working class, regardless of what any individual workers might or might not wish, Lenin had no doubt that it was his duty to lead his party to victory against all opposition. The defeat of Kornilov and the exhaustion of the Provisional Government gave him his chance.

12. The November Revolution.—Trotski, elected chairman of the Petrograd Soviet on Oct. 6, 1917, set up a "military revolutionary committee" of the soviet, which planned insurrection without much attempt at secrecy. Kerenski pursued his efforts to create some sort of representative assembly to give his government authority. Neither the Democratic Conference, which had opened in Petrograd on Sept. 27 and met for a week, nor the Council of the Republic (or "pre-parliament"), which met on Oct. 20, had any influence on events. But Kerenski seemed unable to take any action against the military preparations of the Bolsheviks, who were busily subverting the troops in the capital, distributing arms, and appointing reliable men as commissars in military units. In the night of Nov. 6–7 (N.S.; Oct. 24–25, O.S.) the Bolsheviks acted. They met with very little resistance, and by the following evening the capital was in their hands. In Moscow the fighting went on for several days. Kerenski escaped from Petrograd to the front, but was unable to bring sufficient forces back to threaten the Bolsheviks. No effective resistance was organized from the headquarters of the front at Mogilev, and in mid-November the commander in chief, Gen. N. N. Dukhonin, was replaced by the Bolsheviks' nominee, Ensign N. V. Krylenko. A number of senior officers, including Kornilov, escaped to the southeast and began to plan an anti-Bolshevik force, the so-called Volunteer Army, in the region of the Don.

13. The First Soviet Government.—In the evening of Nov. 7, 1917, the second All-Russian Congress of Soviets met in Petrograd. Since the slogan of the Bolsheviks since April (with the exception of some weeks following the July demonstrations) had been "All power to the soviets," and since indeed the Bolsheviks had now seized power in the name of the soviets, it might have been expected that the new government would be a coalition of the leftist parties represented in the soviets. But the majority of the Menshevik and Socialist-Revolutionary delegates (together constituting only a minority in the congress) walked out of the opening session in protest against the Bolsheviks' insurrection, thus strengthening the Bolsheviks' claim to represent the will of the soviets. Lenin's new government, which he entitled Soviet of People's Commissars, was composed solely of Bolsheviks. But several of its members still wished to form a coalition, and on Nov. 17 five of them resigned in protest, while Kamenev, Zinoviev, and three others resigned from the party's Central Committee. Zinoviev recanted within a few days, but the others remained in opposition for a month. Their return to the fold was made easier when, at the beginning of December, the Socialist-Revolutionary Party split, and its left-wing minority decided to enter the government on Lenin's terms.

The first public acts of the Bolsheviks were decrees on peace and on the land, both of which were approved by the majority of the Congress of Soviets on Nov. 8. The peace decree invited all belligerent governments to begin immediate negotiations for a peace without annexations and without indemnities, and announced the government's willingness to consider any peace proposals made to it and its intention to publish all existing secret agreements concluded by previous Russian governments and to repudiate all such agreements as were aimed at "advantages and privileges for the Russian landlords and capitalists" or at "the retention or expansion of Great Russian annexations." The land decree abolished, without compensation, all private ownership of large landed estates, which, together with possessions of the imperial family, the church, and the monasteries, were to be taken over by the state. The land was to be made available to the peasants. The government reserved its liberty to decide the settlement of the land question by

referring it to the future Constituent Assembly. The decree, however, laid down general principles which amounted to the adoption of the Socialist-Revolutionaries' ideas and the extension of the system of the village commune (*obshchina*) to the whole country. Lenin had not, of course, been converted to the Socialist-Revolutionaries' ideology: rather he realized clearly that to steal their program was the best way to win the peasants gradually away from them.

The Bolshevik approach to the organization of industry was piecemeal. On Nov. 11 the eight-hour day was made compulsory in all enterprises of whatever size. A decree of Nov. 27 conferred on factory committees, elected by the workers, far-reaching rights to supervise the activities of their enterprises, which were obliged to open all their archives and correspondence to them. In principle the committees were not to take over direct management, but in practice they often did so. In any case the real power had passed to the committees. Some individual firms were nationalized, and on Dec. 27 all banking institutions were nationalized; but a general nationalization of industry was not decreed until June 1918. In mid-December 1917, however, was set up the Supreme Economic Council, which began to concentrate in itself the direction of the economy.

14. The Bolsheviks and the Nationalities.—Lenin had long proclaimed the doctrine of self-determination for the non-Russian nationalities, "up to the point of secession." Everything would, however, depend on whom the Bolsheviks recognized as expressing in practice the will of each individual nationality. If the majority of a nationality supported a nationalist movement whose leaders were not socialists, should they be allowed to claim territorial independence and take their homeland out of the Russian Soviet Republic? If a minority supported a socialist party which wished to remain within the Russian Republic, should it be forcibly supported by the Bolsheviks, on the ground that it represented the true interests of the proletariat? Which, in fact, should come first, the whole nationality or its working class? Most of the nationalities, being overwhelmingly composed of peasants, had only a small "working class" in the sense of urban proletariat. And which party should be recognized as representing the working class? In some cases there were numerous parties claiming the title "socialist."

In practice these questions were answered in terms not of doctrine but of force. Where the Bolsheviks were able to support kindred parties, or to impose their direct will, they did so. At the time of the November Revolution, all Poland and a large part of the Baltic provinces were in German hands. In Finland the parliament proclaimed independence from Russia on Dec. 6, 1917. The Bolshevik government recognized this act. But soon conflict broke out between left and right in Finland. On Jan. 26, 1918, the left wing of the Social Democratic Party seized control of Helsinki and proclaimed a Finnish Workers' Socialist Republic. The new government was recognized by Lenin and received some supplies from Russia, while Russian soldiers stationed in Finland gave it some armed assistance. Civil war broke out, with the Reds at first holding the south and the Whites the northwest. In March 1918 the Whites appealed to Germany, and in May the combined White Finnish and German forces defeated the forces of the left.

Lenin in principle recognized the Ukrainians' right to national self-determination. He had, however, two practical objections to their rada. One was that it was composed of non-Bolshevik parties and was based on the intelligentsia and peasantry, while the working class of the big Ukrainian cities was mainly Russian, and indeed formed a large part of the Russian proletariat in whose name the Bolsheviks ruled. The second objection was that the rada was permitting Russian officers and even small units to cross its territory to the Don area, where Kornilov and the Cossack leader, Gen. A. M. Kaledin, were organizing the Volunteer Army, but was at the same time refusing to allow forces loyal to the Bolsheviks to cross the Ukraine to attack them.

The Bolsheviks had only a minority in the All-Ukrainian Congress of Soviets held in Kiev early in December. They therefore walked out of the congress, organized their own counter-congress in Kharkov, and on Dec. 26, 1917, set up a rival government of the Ukraine. On Jan. 4, 1918, the Kharkov government denounced the rada as "enemies of the people," and Bolshevik troops invaded

THE SOVIET OF WORKERS' DEPUTIES IN SESSION, AT PETROGRAD, 1917

the Ukraine. The rada replied with a "Fourth Universal" on Jan. 22, which proclaimed the Ukraine independent. The Bolsheviks, however, had the military advantage. The rada had only very few loyal troops. Kiev fell to the Bolsheviks on Feb. 8. The rada leaders fled beyond the Dnieper. They made some attempts to enlist Allied support, but the Allied governments could neither recognize in principle the independence of the Ukraine nor find any means of giving practical assistance. The rada leaders therefore had no alternative to throwing themselves on the mercy of the Germans.

In Transcaucasia a local assembly was set up after the November Revolution, and from it was formed a regional government, the Transcaucasian Commissariat, in which the most active figures were Georgian Mensheviks. The assembly was suspicious of the Bolshevik government, but did not wish to secede from the Russian Republic. It claimed to exercise authority pending only the convocation of the All-Russian Constituent Assembly.

In the Muslim regions of European Russia the Bolsheviks at first had some hope of success. Lenin's government included a Commissariat of Nationalities, which was entrusted to a Georgian Bolshevik named J. V. Stalin (Dzhugashvili). He set up a commissariat for Muslim affairs within his commissariat and enlisted the support of several Tatar intellectuals. The Tatars, with their preference for a centralized republic, were more likely to support the Bolsheviks than the other Muslim peoples, and their more complex social structure—with a considerable intelligentsia and the beginnings of an industrial working class—made it possible to organize some Communist following among them. Even so, the predominant trend among the Tatars was hostile to Bolshevism.

In the Kazakh steppes, where the hostility of Kazakhs to Russians was due mainly to the colonization of the land by Russian peasants (there had been a large-scale Kazakh armed rising in 1916), a nationalist organization called Alash Orda came into being.

In Turkistan a Muslim Central Council had been set up in the spring of 1917, and presented some rather moderate political and cultural demands to the Russian authorities in Tashkent. The November Revolution in Petrograd had its exact parallel in Tashkent. The Tashkent soviet, representing the local Russian working class—largely railwaymen—and dominated by Bolsheviks, took power. The Muslim council therefore reopened its negotiations with the new rulers of Tashkent, but without success. The Tashkent railwaymen rejected Muslim requests for autonomy and refused to allow Muslims to become members of "the higher organs of the regional revolutionary authority." The Muslims therefore held a congress of their own in Kokand and set up a counter-government of Turkistan. For the next months they held effective power in a large part of the countryside, while those cities which had a Russian population were under Bolshevik control. Bolshevik forces captured Kokand, but their hopes of a rising in Bukhara by the left-wing Young Bukhara Party were disappointed.

15. The Constituent Assembly, Jan. 18–19, 1918.—The Bolsheviks before November had frequently demanded that a Constituent Assembly be summoned. Shortly before October the Kerenski government had fixed the election for the end of November 1917. Lenin decided to let it go ahead. The results are open to some dispute, but the most careful available study estimates them as follows: Russian and Ukrainian Socialist-Revolutionaries, 419 seats; Bolsheviks, 168; Mensheviks, 18; Constitutional Democrats (Kadets) and the right, 17; others, 81. The conditions in which the election was held certainly fell short of ideal freedom, but pressure had been used against the right, not the left.

The fact that only a quarter of the electors had voted for the Bolsheviks therefore came as a disagreeable surprise. Lenin, however, was not dismayed. He had the power, and he did not lack arguments against the assembly. First, the electoral lists had been drawn up before the Socialist-Revolutionaries split: had they been made after the split, then, Lenin claimed, more than 39 out of the 419 S.R. would have been Left S.R. Secondly, he reiterated his argument of April 1917 that the soviets, organs of proletarian revolution, are "a higher form of democratic principle" than the assembly, which is an organ of the bourgeois stage of revolution. Thirdly, the results of the election could not really be taken seriously, because it had been held at a time when "the people could not yet know the full scope and meaning of the November socialist proletarian-peasant revolution." The true expression of the wishes of the Russian people was not the election that actually took place, but the election that would have given the Bolsheviks a majority if it had been held somewhat later, after the people had seen the light.

The Constituent Assembly was therefore condemned by "history" before it ever met. Somewhat more than half its members in fact met in Petrograd on Jan. 18, 1918. After it had rejected by 237 votes to 136 the demand of the Bolsheviks that it should recognize the soviets as superior to itself, the Bolsheviks and the Left S.R. walked out. On Jan. 19, at 5 A.M., the remaining majority of members were asked to disperse "as the guard is tired," and next day they were prevented from reassembling. Some persons demonstrating in the street in favour of the assembly were fired on, but there was no effective force willing to defend it.

16. The Treaties of Brest-Litovsk.—Meanwhile, having unsuccessfully appealed for a general peace, the Bolshevik government had decided to negotiate a separate peace with the Central Powers. An armistice was signed on Dec. 15, 1917, and negotiations began at Brest-Litovsk. The Bolsheviks believed that revolution was imminent in Germany. A series of strikes in January 1918 in Vienna and in Berlin seemed to support this view. The Bolsheviks came not so much to negotiate as to harangue their opponents with revolutionary eloquence, hoping to expedite the German revolution by subverting the German forces. They were also pleased that the Germans were prepared to accept the principle of self-determination and of a peace without annexations. When confronted, however, with Gen. Max Hoffmann and his team, they found that the Germans' interpretation of these terms was no less elastic or unscrupulous than their own. Self-determination did not apply to Poland, Lithuania, and Latvia, now under German occupation. These territories were no longer part of Russia. If their peoples should choose to unite with the German Empire, this would not be annexation. On the other hand, the demand of the Ukrainian rada for separation from Russia was a legitimate claim for self-determination.

On Feb. 9, 1918, the rada, reduced to desperation by the Bolshevik invasion of the Ukraine, signed a peace treaty with the Germans, who recognized the Ukrainian People's Republic. The price of this German support was that the Ukraine should deliver large quantities of grain, of which Germany, and still more Austria-Hungary, stood in dire need. The Bolshevik government refused to accept this, but it was also clear that it would not at present get tolerable terms from the Germans. Hopes of revolution in Germany still remained bright. The solution found by Trotski, who as commissar for foreign affairs was at this time in charge of the Bolshevik delegation at Brest-Litovsk, was to declare a condition of "no war, no peace." Russia refused, he said, to sign an annexationist peace, but at the same time refused to carry on the war. On Feb. 10 he and his delegation returned home.

On Feb. 18 the German and Austro-Hungarian armies advanced along the whole front. As early as January the Central Committee of the Bolshevik Party had been bitterly divided on the negotiations. One section, the "Left Communists," of whom the most prominent was N. I. Bukharin (*q.v.*), urged a "revolutionary war" against the Germans. Trotski's "no war, no peace" proved to be a verbal slogan rather than a policy. Lenin, whose indifference to the defense of Russia in the summer had been the height of utopianism, now was forced to be a realist. He saw that Russia was incapable of resistance to the Germans, its army demoralized (not least by his own propaganda). He was prepared to accept help from the Western enemies of Germany, but his conversations with Western representatives convinced him that the Western governments had neither the will nor the means to help. The choice was a crippling loss of territory or the destruction of his regime. The terms offered by the Germans—even less favourable now than before Feb. 10—at least offered some breathing space until the revolutions came in western and central Europe. Lenin there-

fore decided for acceptance, and obtained a bare majority in the Central Committee. Peace was signed on March 3 at Brest-Litovsk. The capital was moved from Petrograd to Moscow, to be further from the Germans. (*See* BREST-LITOVSK, TREATIES OF.)

By the Brest-Litovsk peace, Russia lost all the Baltic provinces, Lithuania, Poland, and part of Belorussia, whose fate was left to the Germans to decide. The independence of Finland and Ukraine was recognized. In Transcaucasia, the districts of Batumi, Kars, and Ardahan were ceded to Turkey. The lost lands included not only Russia's most fertile grain-producing provinces but also most of its coal-mining and metallurgical industry.

17. The Loss of Bessarabia.—Russia also lost Bessarabia to Rumania, a former ally. Annexed by Russia from the Turks in 1812, Bessarabia had a predominantly Rumanian population, though the landowning nobility had become Russian and the urban business class were Russian-speaking Jews. Before 1914 a Rumanian nationalist movement, led by intellectuals and based on the peasants, had begun to make itself felt, with encouragement and support from Rumania. In 1917 the Rumanian Army, driven back into Moldavia, continued to resist German attacks; but when the Russian Army disintegrated the position of Rumania became hopeless. In Bessarabia, Rumanian nationalists profited from the weakness of Russia to seize power, and an assembly of Bessarabian Rumanians appealed to the Rumanian Army to defend them. Thus when Rumania sued for a separate peace with Germany, it was already in possession of Bessarabia. The Germans imposed severe terms by the Treaty of Bucharest, signed on May 7, 1918, but were willing to allow Rumania the compensation of annexing Bessarabia. The annexation was, however, not recognized by the Moscow government. (*See* BESSARABIA.)

18. Ukraine and Transcaucasia, Spring–Summer 1918.—German and Austro-Hungarian forces restored the Ukrainian rada to power, but their relations with it were unsatisfactory. It was either unable or unwilling to ensure the grain deliveries which it had promised. The German officers disliked both the left-wing phrases and the administrative incompetence of the rada. On April 24, 1918, the rada government was dismissed, and a former general of the Russian Army, Pavel Skoropadski, a descendant of a 17th-century hetman, was placed in power, assuming his ancestor's title. This monarchical regime was never popular, but it did for six months ensure a minimum of public order and made some progress toward creating a system of schools in the Ukrainian language.

In Transcaucasia the Brest-Litovsk peace was received with dismay. The Turks occupied Batumi, ceded by Lenin without consulting the Georgians. The obvious inability of Russia to give any protection caused the Transcaucasian assembly on April 22, 1918, to proclaim the Transcaucasian Federal Republic. In the city of Baku, however, the Communists (Bolsheviks), supported by the Russian workers in the oil industry, set up their own government, recognizing the Moscow government but cut off from it. The Transcaucasian Republic split in three as a result of the lack of common interest between the three nations—Georgians, Armenians, and Azerbaijanis. The first two had territorial disputes of their own, while the third had more in common with the Turks than with their neighbours. At the end of May separate republics of Georgia, Armenia, and Azerbaijan were proclaimed. The Turks, however, continued to advance. They overran Armenia and enlisted some Azerbaijani support for an attack on Baku. Here the Communist regime was overthrown in July by Russian-Socialist-Revolutionaries, who, with a small British force from Persia, defended the city until mid-September, when the Turks captured it. Georgia made a treaty with Germany on May 28, obtaining tacit German protection against further Turkish claims in return for placing the country's mineral resources at the disposal of the Germans. Thus by the late summer of 1918 Georgia was a German vassal state, Azerbaijan a Turkish vassal, while Armenia had ceased to exist.

19. The Outbreak of Civil War: Intervention and Terrorism.—At their party's 7th Congress (March 6–8, 1918), which approved the signature of the Treaty of Brest-Litovsk, the Bolsheviks took the name of Russian Communist Party. The treaty was finally ratified by the 4th All-Russian Congress of Soviets (March 15); but it caused a breach between the Communists and the Left Socialist-Revolutionaries, who thereupon left the coalition. In the next months there was a marked drawing together of two main groups of Russian opponents of Lenin. These were on the one hand those of the non-Bolshevik left who had been finally alienated from Lenin by his dissolution of the Constituent Assembly, and on the other hand the right, whose main asset was the Volunteer Army in the Kuban steppes. This army, which had survived great hardships in the winter of 1917–18 and of which Gen. A. I. Denikin took command on Kornilov's death in action (April 1918), was now a fine fighting force, though small in numbers. Patriotic indignation at the "betrayal" of Russia to Germany (however inevitable) was a common factor between the right and the left in opposition to the Communist government.

At the same time the Western Allies, desperately pressed by the new German offensive in the spring of 1918, were eager to create another front in the east by reviving at least a part of the Russian Army. In March 1918 a small British force was landed

(Left) A demonstration on Red Square in Moscow, Nov. 7, 1920. (Below) Trotski and staff crossing Red Square to inspect troops

(LEFT) SOVFOTO, (BOTTOM) THE BETTMANN ARCHIVE

at Murmansk with the consent of the local soviet. On April 4 Japanese forces landed at Vladivostok, without any approval.

A further factor was the Czechoslovak Legion, composed of Czech and Slovak deserters from the Austro-Hungarian Army, whom previous Russian governments had allowed to form their own units. In March 1918 the Communist government agreed to let these units leave Russia by the Far East, but in May violent incidents took place during the evacuation, and on May 29 Trotski (now commissar for war) ordered them to surrender their arms. They refused, defeated attempts of the local soviets to disarm them, and took control of the Trans-Siberian Railway. In the vacuum created by this action, two anti-Bolshevik authorities appeared: the West Siberian Commissariat, of predominantly liberal complexion, based at Omsk; and the Committee of Members of the Constituent Assembly, composed of Socialist-Revolutionaries, based at Samara.

These events caused the Moscow government to sweep away the remnants of liberty still enjoyed by non-Bolshevik socialists. The Menshevik and Socialist-Revolutionary deputies were expelled from the central and local soviets and prevented from engaging in any organized political activity. On July 9 Left Socialist-Revolutionaries murdered Graf Wilhelm von Mirbach-Harff, the German ambassador in Moscow, and for a short time seized the headquarters of the security police, or Cheka (*Chrezvychainaya Komissia; i.e.,* "Extraordinary Commission"). Shortly afterward other S.R. groups organized unsuccessful armed risings in Yaroslavl and other cities of central Russia. On Aug. 30 an S.R. woman, Fanny Kaplan, shot and severely wounded Lenin, and the same day a leading Bolshevik, M. S. Uritski, was assassinated in Petrograd. The government replied by proclaiming a campaign of "Red terror," including shooting hostages and giving increased powers to the Cheka of summary arrest, trial, and execution of suspects.

Among the early victims of the civil war, which may be considered to have begun in earnest in June 1918, were the former imperial family. Nicholas II, his wife, and his children had been moved in August 1917 to Tobolsk and in the spring of 1918 to Ekaterinburg (Sverdlovsk). With the development of anti-Bolshevik forces in Siberia, the local soviet feared that Nicholas might be liberated. In the night of July 29–30, 1918, all the members of the family were taken to the cellar of the house in which they were living, and butchered by revolvers and bayonets.

20. The All-Russian Directory and Kolchak.—The Russian civil war fell into two main periods, divided by the defeat of Germany in the European war in November 1918. During the first period the anti-Communist forces included a variety of political opinions from right to left. In September 1918 a State Conference was held at Ufa in the Urals, attended by a number of persons who had been elected to the dissolved Constituent Assembly, mostly Socialist-Revolutionaries, with some other political figures. The conference set up an All-Russian Directory, as a provisional government to exercise authority only until the duly elected Constituent Assembly could reassemble. In the late summer the Communists' hastily reorganized armed forces, the Red Army, whose commander in chief was Trotski, the commissar for war, recovered most of eastern European Russia. At Omsk, which became the centre of the anti-Communists, a new army was hastily trained under the command of Adm. A. V. Kolchak, with the assistance of British and U.S. military missions. Meanwhile the British forces at Murmansk were at war with the Communists. In August further British forces landed at Archangel, and the Japanese forces in the Far Eastern territories of Russia had been greatly reinforced.

In Omsk relations between the Directory and Kolchak steadily deteriorated. Kolchak and his officers disliked the left-wing views of the politicians and found it difficult to distinguish between Socialist-Revolutionaries and Communists, lumping together all "Reds" as enemies. To political hostility was added contempt for civilians as such, with a belief that all power should be in the hands of patriotic officers. The S.R. reciprocated the dislike and antagonized their partners by tactless and demagogic gestures. The conflict came to a head when, on Nov. 18, 1918, Kolchak overthrew the Directory and set up his own dictatorship. From this time onward, anti-Communist forces in the East were controlled by the extreme right, and many Russians of socialist views were driven to the conclusion that, if the struggle was now to be one between the Revolution and a restoration of the old regime, then the Communists were the lesser of the two evils. Kolchak's *coup d'état,* moreover, coincided with the end of the European war. Now that the Germans were defeated, the question whether Lenin was or was not pro-German became purely academic. Russians no longer opposed him on patriotic grounds.

21. War in Ukraine, Winter 1918–19.—The end of German power brought the collapse of Skoropadski's regime in the Ukraine. The left-wing Ukrainian nationalists set up a Directory, based on Ukrainian Socialist-Revolutionaries and Social Democrats, and in November took over a large part of the Ukraine. The Communists, however, formed a counter-government of the Ukraine in Kharkov, and at the beginning of 1919 Red Army forces invaded the Ukraine. On Feb. 6 they entered Kiev. The remnants of the forces of the Directory, headed by Simon Petlyura, retreated westward, where they joined forces with the Ukrainian nationalist forces from formerly Austrian Galicia, which had been driven eastward by the army of the new Polish Republic. For the next months the mixed Petlyurist-Galician forces held parts of the Ukraine; other areas were in the hands of anarchist bands led by Nestor Makhno; and the main cities were held by the Communists, ruling not directly from Moscow but through a puppet Ukrainian "government" in Kharkov. The defeat of Germany had also opened the Black Sea to the Allies, and in mid-December 1918 some mixed forces under French command were landed at Odessa, Sevastopol, Kherson, and Nikolayev.

22. The Allies' Dilemma.—The Allied governments now had to decide on their policy in the confused Russian situation. The original purpose of intervention, to revive an Eastern front against Germany, was now meaningless. Russian exiles argued that, since the pre-Bolshevik governments of Russia had remained loyal to the Allies, the Allies were bound to help them; and moreover the small Volunteer Army had never laid down its arms. The Communists, in the exiles' view, were now strong because they had obtained power through German aid, had betrayed Russia to Germany at Brest-Litovsk, and had used the breathing space to build up their own forces; and this unfairly obtained advantage could only be counteracted by massive Allied aid to Denikin and to Kolchak.

To these moral arguments was added the political argument that the Communist regime in Moscow was a menace to the whole of Europe, with its subversive propaganda and its determination to spread revolution. In Germany, in Hungary, and in the Balkans revolutionary movements were strong. In fact the conditions for a collapse of the state machine, such as took place in Russia in 1917, were not present at this time in central Europe, with the partial exception of Hungary. But the fear of such collapse, and of Communist machinations, was strongly felt in the upper classes and the government circles of the West.

On the other hand the prospect of keeping large armies in being to fight a major war in Russia could hardly be entertained by parliamentary politicians. The war against Germany had brought terrible sufferings to France and to Great Britain. The danger from Germany was at last removed. Frenchmen and Englishmen could not believe that their security and liberty depended on who won a civil war in distant Russia. The British and French electors wanted the boys home, and no party was going to win an election which tried to keep them in uniform. This was the main reason against large-scale Western intervention, but there was an important secondary reason in the opposition of organized labour in both countries to any action against a "workers' state." "Hands off Russia!" movements and threats of strike action impressed the governments.

At the beginning of 1919 the French and Italian governments favoured strong support (in the form of munitions and supplies rather than in men) to the Whites (as the anti-Communist forces now came to be called), while the British and U.S. governments were more cautious and even hoped to reconcile the warring Russian parties. In January the Allies, on U.S. initiative, proposed to

all Russian belligerents to hold armistice talks on the island of Prinkipo in the Sea of Marmara. The Communists accepted, but the Whites refused. In March the U.S. diplomat William C. Bullitt went to Moscow and returned with peace proposals from the Communists, which were not accepted by the Allies. After this the Allies ceased trying to come to terms with the Communists and gave increased assistance to Kolchak and Denikin.

Direct intervention by Allied military forces was, however, on a very small scale. The French in the Ukraine were bewildered by the confused struggle between Russian Communists, Russian Whites, and Ukrainian nationalists, and they withdrew their forces during March and April 1919, having hardly fired a shot. The British in the Archangel and Murmansk areas did some fighting, but the northern front was of only minor importance to the civil war as a whole. The last British forces were withdrawn from Archangel on Sept. 27, 1919, and from Murmansk on Oct. 12. The only "interventionists" who represented a real danger were the Japanese, who established themselves systematically in the Far Eastern provinces.

23. The Defeat of the Whites, 1919–20.—In the first half of 1919 the main fighting was in the east. Kolchak advanced in the Urals and had attained his greatest success by April. In May the Red Army's counteroffensive began. Ufa fell in June, and Kolchak's armies retreated through Siberia, harassed by partisans (many of them not Communists but all with reasons to hate Kolchak's regime). By the end of summer the retreat had become a rout. Kolchak set up an administration in November at Irkutsk, but it was overthrown in December by Socialist-Revolutionaries. He himself was handed over to the Communists in January 1920 and shot on Feb. 7.

Meanwhile, in the late summer of 1919, Denikin had made a last effort in European Russia. By August most of the Ukraine was in White hands. The Communists had been driven out, and the Ukrainian nationalists were divided in their attitude to Denikin, Petlyura being hostile to him, but the Galicians preferring him to the Poles, whom they considered their main enemy. In September the White forces moved northward from the Ukraine and from the lower Volga toward Moscow. On Oct. 13 they took Orel. At the same time General N. N. Yudenich advanced from Estonia to the outskirts of Petrograd. But both cities were saved by Red Army counterattacks. Yudenich retreated into Estonia, and Denikin, his communications greatly overextended, was driven back from Orel in an increasingly disorderly march, which ended with the evacuation of the remnants of his army, in March 1920, from Novorossisk.

In 1920 there was still an organized White force in the Crimea, under Gen. P. N. Wrangel. In June, when the Poles had invaded the Ukraine (*see* below), Wrangel struck northward at the Red Army and, for a time, occupied part of the Ukraine and Kuban. But when the Poles retreated, the Red Army had greater forces to spare and could subdue Wrangel, whose rearguards held out long enough to ensure the evacuation of 150,000 soldiers and civilians by sea from the Crimea. This ended the civil war in November 1920.

The Communist victory was at the same time a defeat for the various nationalist movements of the non-Russian peoples. The hopes of the Tatars and Bashkirs, between the Kazan area and the southern Urals, were ruined in the course of the civil war. Kolchak showed no understanding whatever for their aspirations. The Communists proclaimed the right of self-determination, but in practice imposed the dictatorship of the Russian Communist Party on them. The Alash Orda of the Kazakhs suffered a similar fate. In Turkistan, the beleaguered Communist regime in Tashkent established direct contact with the Red Army at the end of 1919. The Moscow government now tried to force the Tashkent Communists to abandon their crudely anti-Muslim policy. But the

Muslim population remained mistrustful of any Russian authorities, and for some years guerrilla bands of nationalists, known as Basmachi, harassed the Communist authorities.

24. The Russo-Polish War and the Baltic States.—In the Ukraine the collapse of Denikin had led to reconquest by the Red Army, as the Ukrainian nationalists had no military forces capable of resisting it. Moreover, after three years of terror, war, and anarchy, it was questionable how much enthusiasm the Ukrainian peasants still had left for the nationalist cause. Petlyura went into exile in Poland. In contrast to the Galicians, Petlyura preferred the Poles to any Russian regime. He made an agreement with Jozef Pilsudski on April 21, 1920: he renounced all claim to eastern Galicia as part of the Ukraine, but would support Pilsudski in his war with Russia. Both men aimed at some future federal association between Poland and the Ukraine. In fact the invading Polish Army received no significant help from the Ukrainian population.

The Russo-Polish War (*q.v.*) was primarily caused by inability to agree on the frontier. The Poles hoped to restore the frontiers of 1772, which would have given them huge areas of Ukrainian and Belorussian population. After initial successes, including the capture of Kiev (May 6, 1920), the Poles were driven back, with the Red Army in hot pursuit. The Communist leaders now hoped that they would be able to link up, through Poland, with the Communists in Germany, and bring about a new wave of revolution in Europe. In Bialystok they set up a provisional government of Polish Communists. But in August they were in turn defeated by a Polish counterattack near Warsaw, and retreated. An armistice was signed on Oct. 12, 1920, and the Treaty of Riga on March 18, 1921. The new frontier left to the Poles considerable Ukrainian and Belorussian populations, but much less than the frontier of 1772.

In 1919 the Communists had attempted to recover the Baltic provinces, and Soviet republics of Latvia and Estonia were declared. In the city of Riga there was a strong Communist movement, which held out until May 1919; but elsewhere the population was predominantly nationalist and nonsocialist. British naval power in the Baltic was also an important factor in the situation. The government of Lenin was obliged to accept these facts. In 1920 it recognized the three Baltic republics as independent states by separate treaties with Estonia (Feb. 2), Lithuania (July 12), and Latvia (Aug. 11). In the southwest, however, the annexation of Bessarabia by Rumania was still not recognized, and diplomatic relations were not established with Rumania until June 9, 1934.

25. Transcaucasia Reconquered, 1920–21.—The defeat of Turkey in World War I led to the revival of the three separate Transcaucasian republics. The Western powers gave them *de facto* recognition. The Armenian cause aroused some sympathy in the West, especially in the United States. But the governments of Armenia and Georgia quarreled with each other, and the Turks under Mustafa Kemal put an end to Armenian hopes of a large state to be carved out of eastern Anatolia. The fatal weakness of Azerbaijan was that, although the democratic nationalist Musavat party had the support of the Azerbaijani peasants, the great city of Baku, with its Russian and Armenian working-class population, was loyal to Moscow. Only Georgia had a strongly supported government, as the Mensheviks were genuinely popular with both workers and peasants. The Moscow government did not intend to respect Transcaucasian independence long. In April 1920 the Azerbaijan government surrendered to the double threat of invasion by the Red Army and rebellion in Baku. On Dec. 3, 1920, the formerly Russian portion of Armenia was incorporated into Soviet Russia, and the Moscow government recognized the rest of Armenia as part of Turkey. In February 1921 the Red Army invaded Georgia. The conquest of this state, which had been recognized by the Moscow government by formal treaty in May 1920 and which had been a rather successful social democratic republic, aroused some indignation in Western Europe, but no practical help could be given. The frontier between Soviet Russia and Turkey was a compromise between those of 1878 and 1918: Batumi returned to Russia, but Turkey kept Kars and Ardahan.

26. The Far Eastern Settlement, 1922.—For the territory around Lake Baikal, and east of it, from the spring of 1920 the fiction of a Far Eastern Republic, independent of Soviet Russia, was maintained. This government was in practice fully controlled from Moscow. The Japanese were sufficiently impressed by the appearance of a buffer state to remove their troops to the Pacific coast region. They showed no desire to evacuate this region; and that they eventually did so was mainly due to diplomatic pressure by the U.S. government, which feared the excessive aggrandizement of Japan in the Pacific. The Japanese delegates at the Washington Conference of Pacific States in the autumn of 1922 were obliged to promise the U.S. government that they would withdraw all their troops from Russian territory. This they did at the end of October. The Far Eastern Republic had now served its purpose, and its assembly in November formally voted it out of existence and united it to Soviet Russia.

27. Trotski and War Communism.—The political system which emerged victorious from the civil war bore the name Russian Soviet Federated Socialist Republic. In fact the soviets were of small importance. All power belonged to the Communist Party, members of which occupied all the posts in the Soviet of People's Commissars and the key posts at all lower levels of the machinery of government. The party itself was governed by its Central Committee, which Lenin dominated.

Second only to Lenin was Trotski, who as commissar for war not only had supreme command of the armed forces but was also largely responsible for organizing supplies and for the mobilization of manpower. The Red Army was at first a rabble of demoralized soldiers and raw recruits. Having preached defeatism for months, it was difficult for the Communists to preach patriotism and military discipline. This, however, was what Trotski did. His personal eloquence and his continuous display of courage and hard work were important factors. It was he too who decided, against opposition from within the party, that the Red Army must employ former imperial officers if it was to be efficient. A combination of threats, material inducements, and appeals to Russian patriotism enlisted thousands of officers, and on the whole they proved loyal. The rigid discipline of the Communist Party also provided a stiffening element, through the Communists serving in the army. By 1919 the Red Army had become at any rate much better than the armies of its White opponents. The victory of the Communists in the civil war is indeed mainly due to this simple fact of military superiority, reinforced by the fact that, holding the central core of European Russia throughout the war, they could plan operations and move men more easily than their enemies, whose bases were on the periphery and cut off from each other.

The relationship of the Communists to the people of Russia was rather complex. On the one hand they used ruthless terror through their Cheka, headed by the Polish Communist Feliks Dzerzhinski (Dzierżynski). This helped them by quelling opposition, but also harmed them by creating still greater hatred, by wasting many innocent lives, and by setting up an organization with a permanent vested interest in suspicion and denunciation, which remained after the war was over. On the other hand the Communists won genuine support by offering the people the vision of a new order of justice and liberty and by extending opportunities to men and women of natural ability but of humble social origins. They could thus draw on millions whom the old regime had ignored.

The early agrarian policy of the Communists, essentially copied from the Socialist-Revolutionaries, had won peasant support. But during the civil war the government had been forced ruthlessly to requisition supplies and to mobilize peasants. The resultant policy, which became known as "War Communism," was due partly to military necessity, but partly also to the belief of party doctrinaires that "socialism" could suddenly be created by decree. Lenin's earlier views about the gradual class differentiation of the peasantry were forgotten. Instead, the doctrinaires arbitrarily divided the existing peasantry into three "classes," labeled "rich" (*kulak*), "medium" (*serednyak*), and "poor" (*bednyak*); and a "class war" was to be instigated by the third, with as much support as possible from the second, against the first. Some attempt was also made to experiment with collective farms. Events did

not in fact conform to any tidy theoretical plan, but there was much suffering, injustice, and resentment. In 1919 and 1920 the government made greater efforts to curb the excesses of local zealots than in 1918. A large part of the peasantry became extremely hostile to the Communists. Yet they probably disliked them less than the Whites, to whom they attributed the intention of handing the former estates back to the landowners.

The industrial workers certainly had little to hope for from the Whites, who showed a complete lack of understanding for their interests in such large cities as they temporarily occupied. The civil war brought a striking decline of all industry. Raw materials were scarce, and workers left the towns for the country in search of food. Many of the ablest skilled workers became organizers of the Communist Party, civil administrators, or army officers: the working class was thus deprived of most of its *élite*. For the minimum essential industry and construction works, men were ruthlessly mobilized. The brief period of blissful anarchy at the end of 1917, with factory committees doing whatever they wished, was replaced by one of direction of labour, in which the trade unions were used by the party as recruiting sergeants.

28. The Kronstadt Mutiny, 1921.—The sacrifices demanded of workers and peasants were tolerable in war, but when the enemy was defeated the mood changed. At the beginning of 1921 there were strikes in Petrograd affecting almost all the city's industry. The strikers demanded not only economic concessions but free elections to the soviets and the release of socialists who were in prison. At the beginning of March a revolt broke out in the nearby naval base of Kronstadt. The sailors' demands were also for political freedom, and there had been contact between the sailors and the Petrograd strikers. The program of the Kronstadt mutiny was definitely socialist and definitely accepted soviets as the form of government, but it rejected the dictatorship of the Communist Party over the soviets and over the working class. But Lenin, though willing to make far-reaching economic concessions, would not for a moment consider any compromise on the matter which for him always had first priority—political power. The Communist Party's dictatorship must at all costs be maintained. The Kronstadt mutineers were denounced as agents of the Whites and as intending to restore capitalism. Though no shred of evidence has been found to support either accusation, both were endlessly repeated by the propaganda machine. On March 7, 1921, military operations were begun against Kronstadt, and on March 18 the fortress was stormed.

29. The 10th Congress and Lenin's Dictatorship.—The Communist Party held its 10th Congress in Moscow in March 1921. Its debates were lively, for there were two opposition groups within the party, the "Workers' Opposition," which wished to transfer power to the trade unions and form something like a syndicalist state, and the "Democratic Centralism" group, which wished for greater freedom within the party and within the soviets while maintaining the ban on parties other than the Communist. Lenin was unwilling to compromise with either group, and both were defeated by large majorities. The most important consequence of the 10th Congress was its formal prohibition of "fractionalism": members of the party had the right to criticize the party's policies as individuals, but they must put their criticisms before the party as a whole, not before any smaller group within the party; an individual might make a proposal to the Central Committee, but if he first enlisted the support of even one other individual, he was thereby guilty of creating a "fraction." One clause of the resolution on "the unity of the party," which was kept secret for the next three years, provided that persons guilty of fractionalism could be expelled from the party.

Lenin went far to meet popular economic discontent by the introduction in 1921 of his "New Economic Policy," which reaffirmed the right of peasants to the ownership of their land, reduced the burden of taxation on them, and also permitted a certain amount of private business enterprise—especially in trade. But in the political field he was inflexible. No political opinions, let alone organizations, other than the Communist were to be allowed. The Communist Party itself was controlled nominally by its Central Committee, but to an increasing extent by smaller bodies elected by it—the Political Bureau, the Organization Bureau, and the Secretariat, all set up by the 8th Congress in March 1918. At the head of the pyramid was Lenin himself, the man of genius who had swept all rivals out of his path and set up in Russia a form of government more rigidly dictatorial than that of any tsar. But in his own view and in that of all subsequent writers of works published in Soviet Russia, this was no mere seizure of power but "the great October Socialist Revolution," opening a new era in the ineluctable progress of the human race toward Communism.

For later events *see* UNION OF SOVIET SOCIALIST REPUBLICS: *History; see* also COMMUNISM; COMMUNIST PARTIES.

BIBLIOGRAPHY.—The English edition, by A. Rothstein and Clemens Dutt, of the *History of the Communist Party of the Soviet Union* (1960) gives the latest version of the official Soviet line on the history of the Revolution. Lenin's actions can be documented from his *Works*, 5th Russian ed., vol. 31–45 (1958–64), or select English ed., vol. 7–12 (1936). Trotski's version is in his *History of the Russian Revolution* (1934). For a general survey, particularly good on foreign policy, *see* E. H. Carr, *The Bolshevik Revolution*, 3 vol. (1950–53). For the Socialist-Revolutionaries, *see* O. H. Radkey, *The Agrarian Foes of Bolshevism* (1958), *The Sickle Under the Hammer* (1963). For the opposition to the Bolsheviks, *see* L. B. Schapiro, *The Origin of the Communist Autocracy* (1955). For the non-Russian nationalities *see* R. E. Pipes, *The Formation of the Soviet Union* (1954).

(G. H. N. S.-W.)

RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC, the largest of the 15 constituent Union Republics of the U.S.S.R. Established immediately after the October Revolution (1917), it became a Union Republic on Dec. 30, 1922, when the U.S.S.R. as a federal state was created. Area, 6,592,658 sq.mi. Pop. (1959 census) 117,534,315, (1964 est.) 124,777,000. Its huge area extends from the Baltic Sea to the Pacific Ocean, across 11 time zones, and from the Arctic Ocean to the Caspian Sea, and includes the greater part of European Russia and all Siberia and the far east. Generally speaking, the R.S.F.S.R. includes those parts of the Soviet Union where the Russian nationality forms the majority, although since World War II Russians have also become the majority in the Kazakh Soviet Socialist Republic. Within the R.S.F.S.R. are many non-Russian peoples and it should be remembered that the word "Russian" of its title is a translation not of Russkaya ("pertaining to the Russian nationality"), but of Rossiyskaya ("pertaining to the country Russia"). The larger nationalities have their own areas, with varying degrees of autonomy. Thus in the R.S.F.S.R. there are 16 Autonomous Soviet Socialist Republics: for the Bashkirs, Buryats, Chechen and Ingush, Chuvash, Dagestanis, Kabardinians and Balkars, Kalmyks, Karelians, Komi, Mari, Mordvinians, Ossetians, Tatars, Tuvinians, Udmurts, and Yakuts. Smaller groups have Autonomous *oblasts*, of which there are five, and the smallest have National *okrugs* (districts), of which there are 10, mostly in the extreme north and northeast. The largest nationality groups are shown in Table I.

TABLE I.—*Largest Nationality Groups in the R.S.F.S.R.*

Nationality group	Population (1959 census)	Percentage of total
Russians	97,863,579	83.3
Tatars	4,074,669	3.5
Ukrainians	3,359,083	2.9
Chuvash	1,436,218	1.2
Mordvinians	1,211,105	1.0
Bashkirs	953,801	0.8
Jews	875,307	0.7
White Russians	843,985	0.7
Germans	820,016	0.7
Udmurts	615,640	0.5
Mari	498,066	0.4
Komi and Komi-Permyaks	425,810	0.36
Kazakhs	382,431	0.3
Armenians	255,978	0.2
Buryats	251,504	0.2
Ossetians	247,834	0.2
Yakuts	236,125	0.2
Kabardinians	200,634	0.2
Karelians	164,050	0.1
Poles	118,422	0.1

Apart from the national areas the R.S.F.S.R. is divided administratively into 49 *oblasts* and 6 *kray* (marchlands or territories), the latter representing former areas of pioneer settlement in the North Caucasus and Siberia.

TABLE II.—*The R.S.F.S.R.; Percentage Comparison with the U.S.S.R. (1962)*

Item	Percentage of U.S.S.R.	Item	Percentage of U.S.S.R.

The administrative centre of the republic is the capital of the U.S.S.R., Moscow. Altogether there are 901 cities and 1,678 settlements of urban type, containing 61,611,074 people, 52% of the total population. Of the towns, three had more than 1,000,000 inhabitants in 1961: Greater Moscow (6,208,000), Leningrad (2,888,000), and Gorki (1,003,000). Since the R.S.F.S.R. represents so much of the Soviet Union, its geography and history are largely those of the larger unit, but Table II indicates its significance in the country as a whole.

See also UNION OF SOVIET SOCIALIST REPUBLICS. (R. A. F.)

RUSSKAYA PRAVDA, a codification of old Russian customary law and of those princely statutes and enactments which were considered precedents for future court decisions. *Russkaya Pravda* was compiled in Kievan Russia during the 11th–12th centuries, and is usually classified by scholars in two basic "versions": short and expanded. The short version, compiled under Yaroslav the Wise, grand prince of Kiev from 1019 to 1054, contains primarily norms of penal law, based on contemporary custom which at that time still recognized the right of blood revenge for a murdered relative. After Yaroslav's death his sons abolished blood revenge and, instead, introduced punishment by money payment ("bloodwite"), according to the law and to the decision of the princely court. In the course of the 12th century the code was considerably enlarged and revised and thus the so-called expanded version came into being. An important part of it was a statute of Prince Vladimir II Monomakh (reigned 1113–25) concerning loans and interest, designed to prohibit severe usurious practices. Many additional provisions regulated family and inheritance law, commerce, and the legal position of indentured labourers (*zakupy*), and laid down detailed rules concerning slavery.

The *Russkaya Pravda* not only gives evidence of the legal norms and court procedures of the 11th–12th centuries; it also gives an insight into the social structure of Russian society in that period. In the repeal of the old custom of blood revenge can be seen the influence of newly introduced Christianity. It is also noteworthy that the *Russkaya Pravda* did not admit capital punishment and allowed corporal punishment only for slaves.

See *Medieval Russian Laws,* Eng. trans. by G. V. Vernadsky (1947); B. D. Grekov (ed.), *Pravda Russkaya,* 2 vol. (1940–47).

RUSSO-FINNISH WAR: *see* WORLD WAR II; EUROPE: *History;* FINLAND: *History;* UNION OF SOVIET SOCIALIST REPUBLICS: *History.*

RUSSO-JAPANESE WAR (1904–05). By the early 17th century Russia had established its authority over all of Siberia, but its attempts to move southward were consistently blocked by China. Fully engaged in Western Europe and against Turkey during the 18th century, Russia was in no position to press its interests in the Far East. As the settlement of Siberia developed, however, it became more alive to its need for outlets to the sea and, since China continued to deny it access to the Amur region, it resorted to force toward the end of the reign of the emperor Nicholas I (1825–55).

In the 1850s Russian towns and settlements appeared along the left bank of the Amur (Hei-lung) River. The Chinese government made repeated protests, but engaged at this time in its struggle against Great Britain and France, and distracted by the T'ai P'ing Rebellion, China was unable to resist Russian pressure. Finally by the Treaty of Aigun (Aihun, or Aihui; 1858, confirmed by the Treaty of Peking, 1860) China ceded to Russia all the territory north of the Amur, together with the maritime region east of the Ussuri (Wu-su-li) River from the mouth of the Amur to the boundary of Korea, including the splendid site where Vladivostok was soon to be founded. Russian expansionist policy was now alarming other European powers, however, and in 1861 Great Britain thwarted a Russian attempt to establish a naval base on the island of Tsushima, lying between Korea and Japan. For the next 30 years Russia was content to consolidate its gains.

The reign of the emperor Alexander III (1881–94) witnessed a revival of interest in the development of the Asiatic parts of the Russian empire. In 1891 Alexander sent his son, soon to reign as Nicholas II, on a much publicized tour of the Far East, and at this time work began on the Trans-Siberian Railway. After the accession of Nicholas II in 1894 Russian expansionist policy became more active and pronounced, but in this year the Sino-Japanese War demonstrated that in Japan a new power had emerged.

The Emergence of Japan.—The transformation of Japan from a backward feudal state into a vigorous modern power, a process begun only in 1868, had been carried through with such dramatic speed that within a quarter of a century Japan was ready to assert itself against the vast, but backward, Chinese Empire. In its foreign policy Japan aimed first at extending its authority into Korea, a state over which China had long claimed suzerainty. Its struggle with China for predominance in Korea gave rise to several crises and finally, in 1894, to war. Japan with its modernized army and navy at once won a series of striking victories against the Chinese, who in the Treaty of Shimonoseki, signed on April 17, 1895, ceded to Japan the Kwantung (Liaotung) Peninsula, on which Port Arthur (Lü-shun) stands, together with Formosa (Taiwan) and the Pescadores Islands, and agreed to pay a heavy indemnity.

This display of Japanese power and its decisive victory over China threatened to close the door on Russia in the Far East, and made conflict between Russia and Japan inevitable. The Russian government was quick to react to the Treaty of Shimonoseki. On the initiative of Nicholas II, Russia, Germany, and France intervened by diplomacy and compelled Japan to give up its territorial gains in return for an increased indemnity. Guided by S. Y. Witte, his minister of communications and finance, Nicholas II at once obtained for China a loan, enabling it to pay the large indemnity to Japan, and in 1896 Russia concluded an alliance with China against Japan, guaranteeing the integrity of Chinese territory. Also under this treaty of alliance Russia obtained the right to lay the eastern section of the Trans-Siberian Railway across Manchuria by way of Harbin (Ha-erh-pin) to Vladivostok, to extend a branch line from Harbin to Mukden (Shen-yang) and Talien (Lü-ta, Dalny, or Dairen), and to administer and patrol a strip of territory on either side of the railway, using Russian troops.

European Rivalry in China.—An era of European rivalry had now begun in the Far East. The German emperor William II during a visit to Russia in 1897 secured the support of his cousin, Nicholas II, for the German annexation of Kiaochow (Chiao-hsien). Subsequently Nicholas II himself decided to seize Port Arthur, in spite of his own guarantees of the integrity of Chinese territory, and in spite of the strong opposition of his minister, Witte, who nevertheless managed to win Chinese agreement to a lease of Port Arthur for 25 years (April 8 [new style]; March 27 [old style], 1898). Russia thus entered into the occupation of the Kwantung Peninsula from which only three years earlier it had excluded Japan.

The seizure of Chinese territory by Germany and Russia was followed by British demands for Wei-hai (Wei-hai-wei) and French demands on Kwangchow (Kuang-chou). A wave of xenophobic feeling in China erupted in the so-called Boxer Rebellion (1899–1900), and Japan and the European powers intervened to restore order. Russia made this rebellion the excuse to pour troops into Manchuria, whence it planned to invade Korea, the independence of which since the Treaty of Shimonoseki was "guaranteed" by Japan.

During the years of intensive preparation to assert its power

in the Far East, Japan had built up an efficient army and navy. As a result of its recruiting law of 1896, by January 1904 its front-line army numbered 270,000 highly trained troops and although its reserves amounted only to some 200,000 men of older classes, it had gained a distinct preponderance over Russia in the Far East. Including all patrols on the Manchurian railways and the small garrisons at Port Arthur and Vladivostok, Russia had only some 80,000 troops. At the other end of the Trans-Siberian Railway, however, it had almost overwhelming manpower available, for the peacetime strength of the Russian Army was approximately 1,000,000 men. The Japanese, of course, entertained no thought of attacking Russia itself, but were concerned wholly with winning an early and decisive victory which would securely establish their hegemony in the Far East. In this strategy they were counting on the Trans-Siberian Railway's proving inadequate to the task of bringing up timely reinforcements, and their miscalculation on this score might have involved them in disaster.

Russian Policy in the Far East.—The Russian government was confused and unrealistic in its policy, leading up to this war with Japan, and indeed in the conduct of the war itself. This fact, combined with the ineffective leadership of its troops, was more than any other factor responsible for its defeat. Gen. A. N. Kuropatkin, Nicholas II's minister of war, had watched with anxiety the growth of Japanese armed strength and, realizing that Japan had gained preponderance in the Far East, he had in the summer of 1903 recommended that Russia should abandon its projects in Manchuria and restore Port Arthur to China in return for concessions in the Vladivostok region. His proposals were accepted, but extremists at the imperial court and the powerful commercial interests behind the Russian expansionist movement in the Far East nullified Kuropatkin's policy. Meanwhile nothing was done to strengthen Russian forces and the Russian government simply ignored Japan's preparations and obvious intentions.

The Outbreak of War.—On the night of Feb. 8/9 (N.S.), 1904, without any declaration of war, the main Japanese fleet under the command of Adm. Togō Heihachirō took the Russian squadron by surprise at Port Arthur, inflicting serious losses and imposing a blockade on the harbour. Adm. E. I. Alekseev, a sycophantic and incompetent favourite of the emperor, who was viceroy and at first commander in chief of the Russian forces in the Far East, gave the demoralizing order that the navy was not to risk proceeding to sea. When Adm. S. O. Makarov, a brave and able officer, assumed command of the navy, however, he took his ships to sea daily and seriously harassed the Japanese fleet, but unfortunately lost his life on April 13 when his flagship "Petropavlovsk" struck a mine and sank. The Russian squadron was thereafter kept in harbour for months, while the Japanese fleet lay off Port Arthur unchallenged. Thus the Japanese fleet, although in strength about equal to the Russian Far Eastern Fleet, kept the enemy fleet divided and confined in Port Arthur and Vladivostok.

JAPANESE SOLDIERS AWAITING RUSSIAN CHARGE DURING THE BATTLE OF LIAO-YANG

Without waiting to gain command of the sea, the Japanese had begun in March transporting their 1st Army (under the command of Gen. Tamemoto Kuroki) across the sea to Korea, landing them at Chemulpo (or Inch'ŏn), not far from Seoul, and at Nampo in the north. The roads were so bad, because of the thaw, that it took many days before the Japanese Army was in position before the town of Wiju (Sinŭiju) on the Yalu River. On May 1 the Japanese attacked and after bitter fighting defeated the Russian forces. Japanese losses were about 1,100 men out of a force of 40,000 while Russian losses were 2,500 out of their force of 7,000 troops engaged in this action. It was a victory of tremendous significance, for, although the outnumbered Russians had made an orderly withdrawal, it was Japan's first victorious engagement against a Western nation.

Russian Strategy.—A public outcry against Alekseev as commander in chief compelled Nicholas II to send Kuropatkin to take over the command, although Alekseev remained as viceroy. Kuropatkin had proved a competent minister of war, but was to show himself sadly irresolute and passive as a commander in action. His policy was to avoid action, wherever possible, until he had superiority in numbers. He placed his forces so that they could delay the enemy and then retire to positions prepared in the rear.

During May the Japanese 2nd Army (Gen. Yasukata Oku) landed on the Kwantung Peninsula and on May 26, outnumbering the Russians by ten to one, won the Battle of Nanshan, cutting off the Port Arthur garrison from the main forces in Manchuria. Two more divisions landed on the eastern Korean coast to form the 3rd Army (Gen. Kiten Maresuke Nogi) to operate against Port Arthur, while a further division, to form the nucleus of a 4th Army (Gen. Michitsura Nodzu), was landed on the Manchurian coast at Ku-shan.

Kuropatkin was disturbed by this enemy concentration. He ordered preparations to make Mukden a stronghold to which he could retreat, but at this time he received an order, signed by the emperor himself, impressing on him that the fate of Port Arthur was his direct responsibility. Kuropatkin therefore disposed his main forces around Liao-yang (south of Mukden). But at Wafangtien (Fu-hsien) on June 14, the Japanese with 35,000 men decisively defeated a 25,000-strong Russian army. The Japanese then advanced in three columns on Liao-yang, where the main Russian force under Kuropatkin had retired and taken up strong positions. Even an unexpected sortie of the Russian squadron at Port Arthur, which for a time paralyzed the Japanese land offensive, and then the sudden appearance of the Russian Vladivostok squadron in the straits of Tsushima, which added to the anxieties of the Japanese high command, did not embolden the Russian command to adopt more aggressive tactics. Toward the end of July Kuropatkin engaged General Kuroki in what proved an in-

decisive battle, after which Kuropatkin himself fell back on Liao-yang and there remained on the defensive, although he had considerable opportunities to attack the advancing enemy columns.

On Aug. 25 (N.S.) the Battle of Liao-yang was joined, and after nine days of stubborn fighting the Japanese won a significant victory, and with inferior numbers: 130,000 against 180,000 Russians. Nevertheless their losses of some 23,000 men faced them with serious difficulties, for they had limited trained reserves, whereas the Russians had withdrawn in good order toward Mukden, where they were now receiving reinforcements via the Trans-Siberian Railway at the rate of 30,000 men a month.

Realizing that the Japanese were nearing the end of their resources, while the Russian Army was gaining in strength, Kuropatkin resolved now to take the offensive, while making careful preparations to hold Mukden, which as the capital of Manchuria had special political importance. The first battle, resulting from Kuropatkin's new offensive tactics, was fought on the Sha-ho River during Oct. 5–17 (N.S.), 1904, and a subsequent battle took place at Sandepu during Jan. 26–27, 1905; both might have been decisive victories for Russia had Kuropatkin and his senior officers shown more resolution and aggression, but in the event both battles proved indecisive.

Capture of Port Arthur.—Meantime at Port Arthur the Japanese had found the Russian garrison much stronger than they had expected. After several very costly attempts to take the fortress, they abandoned general assaults and resorted to siege tactics. The dragging on of these operations distressed the Japanese command, for it not only tied down their 3rd Army, which they needed urgently in the main theatre of war, but it also reacted badly on the morale of their troops in Manchuria.

The news of the sailing of the Russian Baltic Fleet for the Far East made the Japanese redouble their efforts to take Port Arthur. They suffered very heavy casualties in the storming tactics to which they had once again resorted. Among the officers of the Russian garrison, however, there was serious disagreement; some urged surrender while others insisted that the garrison must resist to the end. But on Jan. 2 (N.S.), 1905, Lieut. Gen. A. M. Stössel, the commander of the fortress, a man not only grossly incompetent, but also corrupt, sent out the white flag without reference to his officers, and thus surrendered Port Arthur. It was an act of treachery, for the fortress contained provisions for over three months and adequate supplies of ammunition.

The Battle of Mukden.—The final and greatest battle of the war was fought for Mukden (Feb. 19–March 10 [N.S.], 1905). Again Kuropatkin had decided to attack, but this time the Japanese forestalled him. Three Russian armies—from right to left, the 2nd (under Gen. Baron A. V. Kaulbars), the 3rd (under General Bilderling) and the 1st (under Gen. N. P. Linevich), comprising 330,000 men and 1,475 guns in all—held firm against three Japanese armies under the command of Marshal Iwao Oyama (who had 270,000 men and 1,062 guns). After long and stubborn fighting and heavy casualties, Kuropatkin decided to draw off his troops to the north, a movement carried out successfully, but it left Mukden to fall into the hands of the Japanese. Losses in this battle were exceptionally heavy, approximately 89,000 Russians and 71,000 Japanese having fallen. Japan was now exhausted and could not hope to pursue the war to a successful conclusion. But the naval victory of Tsushima, together with the increasing internal unrest throughout Russia, where the war, which had never been popular, had become a focal point for the widespread movement against the regime, brought the Russian government to agree to peace.

The Russian Baltic Fleet.—The Japanese had been unable to secure the complete command of the sea on which their campaign depended. The Russian squadrons at Port Arthur and Vladivostok had made sorties and both sides had suffered losses in engagements. Meanwhile in St. Petersburg it was decided to send the Baltic Fleet to the Far East under the command of Adm. Zinovi Petrovich Rozhestvenski, for it was clear that once the Russians had gained command of the sea, the Japanese campaign would collapse.

The Baltic Fleet, having spent the whole summer fitting out, sailed from Liepaja on Oct. 15 (N.S.), 1904. Off the Dogger Bank on Oct. 21, several Russian ships opened fire on British trawlers in the mistaken belief that they were Japanese torpedo boats, and this incident aroused such anger in England that war was only avoided by the immediate apology and promise of full compensation made by the Russian government. At Nossi-Bé, near Madagascar, Rozhestvenski learned of the surrender of Port Arthur and proposed returning to Russia, but, expecting naval reinforcements which had been sent from the Baltic via Suez early in March, 1905, and which later joined him at Camranh Bay (Vietnam) he decided to proceed. His full fleet amounted to a formidable armada, but many of the ships were old and unserviceable. Early in May the fleet reached the China Sea and Rozhestvenski made for Vladivostok via the Tsushima Strait. Admiral Togō lay in wait for him on the south Korean coast near Pusan and on May 27, as the Russian Fleet approached, he attacked. The Japanese ships were superior in speed and armament and in the course of the two-day battle two-thirds of the Russian Fleet was sunk, six ships were captured, four reached Vladivostok, and six took refuge in neutral ports. It was a dramatic and decisive defeat; after a voyage lasting seven months and when within a few hundred miles of its destination, the Baltic Fleet was shattered and with it Russia's hope of regaining mastery of the sea was crushed.

The Treaty of Portsmouth.—The disastrous course of the war had seriously aggravated unrest inside Russia, and the surrender of Port Arthur, followed by the loss of Mukden and the devastating defeat at Tsushima made the emperor accept the proffered mediation of Pres. Theodore Roosevelt of the United States. It was, however, the Japanese government which had taken the initiative in proposing peace negotiations. Exhausted financially and fearing a long-drawn-out war of attrition far from their bases, the Japanese hoped that the acute unrest in Russia would compel the government to discuss terms, and their hopes proved justified.

Negotiations began at Portsmouth, N.H., on Aug. 9 and by the peace treaty signed on Sept. 5, 1905, Russia agreed to surrender its lease of the Kwantung Peninsula and of Port Arthur, to evacuate Manchuria, to cede the half of Sakhalin annexed in 1875, and to recognize Korea as within Japan's sphere of interest.

With this treaty ended the Far Eastern expansionist policy directed toward establishing Russian hegemony over the whole of Asia. Furthermore the humiliating defeats at the hands of an Asiatic power which had until so recently been primitive and backward, added to the national anger and disgust. Within two months a revolution had compelled Nicholas II to issue the October manifesto, which was the equivalent of a constitutional charter. This defeat also had profound repercussions throughout Asia and Europe. Russia nevertheless remained an Asiatic power, possessing as it did the railways across Siberia and northern Manchuria to Vladivostok, and being closely allied with China.

RUSSO-POLISH WAR (1919–20). The Russo-Polish War was a result of the German defeat in the west at the end of World War I and of the Soviet determination to carry the Communist revolution to central Europe. On the day of Germany's surrender (Nov. 11, 1918), Poland's independence was proclaimed in Warsaw, but huge German armies were still in occupation of the western part of the former Russian Empire. Jozef Pilsudski (*q.v.*), provisional head of the Polish state and commander in chief of the nascent Polish Army, decided not to interfere with the retreat of the German forces from Russia, provided that they went through East Prussia. A temporary demarcation line between Polish and German forces was established to the west of the railway Kovel-

Brest(Brzesc)-Bialystok-Grajewo. Evacuation of the former Russian lands by the German forces had to be completed by the beginning of February 1919.

Because of German-Soviet collusion, every strip of land evacuated by the Germans was immediately occupied by the Red Army. German generals were hoping to bring Soviet Russia and Poland into war which would destroy the latter and enable Germany to appear as the sole defender of Europe against the revolutionary flood. On the Soviet side, Lenin's strategy was the converse: the mission of the Red Army was "to destroy the wall separating Soviet Russia from revolutionary Germany." Thus at the beginning of February 1919 the Red Army was approaching the line Grodno-Brest-Kovel.

Pilsudski decided that it was vital "to reject . . . the forces aiming at imposing a foreign form of government on Poland." The Polish counteroffensive began on Feb. 9, 1919. At the end of the year the Polish forces stood on the middle Dvina and along the Berezina, Ptich, Ubort, and upper Sluch rivers to a point east of Kamenets-Podolski near the Rumanian frontier. The Polish advance had of course been helped by the fact that the Red Army was also engaged against White Russian armies.

Pilsudski expected a second and more powerful Soviet offensive in the spring of 1920. But on Jan. 28, 1920, the Soviet government sent to the Polish government proposals for an armistice based on the existing front line and for a peace conference. Pilsudski, however, knew that the Soviet high command was concentrating big new units on the Polish front; and, moreover, he was convinced that the moment was favourable for reviving the historic idea of a Polish-Lithuanian-Ukrainian federation. On April 21, he and the Ukrainian leader Symon Petlyura (*q.v.*) signed a treaty of alliance. Three days later an army group of ten infantry divisions (including two Ukrainian) and four cavalry brigades was launched against two weak Soviet armies south of the Pripet River. On May 7, Kiev was occupied by a Polish army under Gen. Edward Smigly-Rydz, while between the Dnieper and Dniester rivers Polish-Ukrainian forces held the line Belaya Tserkov-Lipovets-Gaysin-Vapnyarka-Yampol.

Further advance southward was halted when Pilsudski learned that, on May 15, 1920, M. N. Tukhachevski (*q.v.*), commander of the Soviet Western Army Group, had attacked across the Dvina. Tukhachevski reached Lake Naroch, but by June 7 was driven back on the Berezina. In the meantime, however, the Soviet supreme commander, Sergei S. Kamenev, had ordered S. M. Budenny to march northward from the Guman area with four cavalry divisions. On June 7, Budenny was at Zhitomir and Berdichev in the rear of Smigly-Rydz, who was therefore ordered to evacuate Kiev (June 12) and to retreat westward. He succeeded in doing so, but on July 5 Budenny entered Rovno.

The decisive battles started north of the Pripet marshes. On July 2, 1920, Tukhachevski issued an Order of the Day proclaiming to his armies that "the fate of the general revolution will be decided in the west" and that "the road to world conflagration leads over Poland's corpse." Two days later, on a front of about 500 km., he attacked with 21 infantry divisions and with Gai Khan's cavalry corps on his right flank (about 220,000 combatants). The Polish army group under the elderly Stanislaw Szeptycki, comprising 12 infantry divisions and one cavalry brigade (about 120,000 combatants), started a general retreat. Minsk fell to the Russians on July 11, Wilno (Vilnius) on July 14, Grodno on July 19.

Pilsudski never lost his nerve. Needing arms and ammunition, he sent his prime minister, Wladyslaw Grabski, and his chief of general staff, Tadeusz Rozwadowski, on a mission to the Supreme Allied Council, which was then in session in Belgium. The Western Powers promised help which either did not materialize (as from Great Britain) or arrived too late (as from France). But a Franco-British diplomatic and military mission, including Gen. Maxime Weygand, was sent to Warsaw. Pilsudski offered Weygand the post of chief of Polish general staff, but Weygand sensibly declined and became, instead, an adviser to Rozwadowski.

Tukhachevski was still advancing westward, with the bold plan of crossing the Vistula at Plock so as to be able to attack Warsaw's defenders from the rear. Pilsudski divined this intention and, after discussions with Rozwadowski and Weygand, wrote in the night on Aug. 5–6, 1920, his historic Order of the Day prescribing (1) that in the south the enemy should be stopped east of Lwow (Lvov); (2) that in the north the left flank of the Polish forces should be covered and the right bank of the Vistula should be held for the defense of Warsaw; and (3) that in the centre an army of five divisions should be concentrated on the Wieprz River for a strategic maneuver designed to disrupt the rear of the Soviet armies as they approached Warsaw.

On Aug. 16, 1920, Pilsudski himself took command of the Wieprz operation and started marching northward with his shock divisions. It was a crushing attack which completely surprised the enemy. Two days later, when Pilsudski was at Drohiczyn on the Bug River, Tukhachevski recognized the failure of his enterprise and ordered a general retreat. This disengagement, however, was a disastrous one: the Poles made 66,000 prisoners of war, taking 231 guns and 1,023 machine guns. Tens of thousands of Soviet soldiers fled across East Prussia and Lithuania. Tukhachevski's attempt to make a stand along the line Sejny-Grodno-Volkovysk ended in another defeat (Sept. 20–28). At the beginning of October, Polish forces reconquered the major part of the territory occupied during 1919. An armistice was signed at Riga on Oct. 12 and military operations ceased six days later.

RUSSO-TURKISH WARS. Wars fought by Russia against the Ottoman Turkish Empire resulted in the eventual extension of the Russian frontier to the line of the Prut River in Europe and to beyond the Caucasus Range in Asia. In the 17th century Russia was faced with the problem of an ill-defended southern frontier over which little control could be exercised. The Cossacks (*q.v.*) of the Dnieper and the Don were unruly frontiersmen with institutions of their own, while the Tatars of the Crimea, vassals of the sultan, annually drove their herds and flocks out into the grasslands of the Ukraine and, from time to time, sent their horsemen to raid deep into Poland and Russia.

The 17th Century and Peter the Great.—The first Russo-Turkish War (1676–81) was fought in right-bank Ukraine (that is, Ukraine west of the Dnieper), without success for Russia. Having concluded a "perpetual peace" with Poland to settle disputes over the Ukraine (1686), Russia renewed the war in 1687, and V. V. Golitsyn (*q.v.*) tried unsuccessfully to invade the Crimea (1687 and 1689). When the tsar Peter I (*q.v.*) renewed the attempt to push back the Turks, he chose instead to march by the easier route down the valley of the Don to besiege the Turkish fortress of Azov. He failed in his attempt of 1695, but in the following year he succeeded in taking the fortress. Russia did not make substantial gains at the expense of Turkey, since Austria, Poland, and Venice, in league against the Turks from 1684, made their peace of Karlowitz early in 1699; but the Russo-Turkish peace of 1700 left Russia in possession of the towns of Azov and Taganrog, while the tribute, formerly paid by the tsar to the Crimean Tatars, was abolished and Russia for the first time obtained the right to appoint a resident minister to the Porte.

In November 1710, Turkey declared war on Russia just as Russia was beginning to get the upper hand in the Northern War (*q.v.*) against Sweden. Peter I had no wish for war with Turkey, but the strategy that he devised was original. Turning to the west, Peter planned to enter Moldavia and Walachia (*see* RUMANIA) in order to arouse the Christian population of European Turkey against the sultan. Unfortunately for Peter he was surrounded at Stănileşti on the Prut (July 19, 1711, new style; July 8, old style)

and forced to sue for peace, which was granted (July 23). Peter was compelled to surrender the fortress of Azov to the Turks and to promise to abstain from interference in the internal affairs of Poland, as well as to guarantee free passage across his territory to Charles XII of Sweden, then a refugee with the Turks (this last proviso had no effect). These were moderate terms in view of the predicament in which Peter found himself. Disputes concerning the fulfillment of the peace of the Prut led to a fresh Turkish declaration of war in November 1712, but peace was reaffirmed in 1713 at Adrianople (Edirne).

The strategy of Russo-Turkish conflict changed in the 1720s when the anarchy prevailing in Persia as a result of the Afghan invasion made it possible for Turkey to envisage establishing a base on the Caspian Sea from which to threaten Astrakhan. Peter's expeditions of 1722–23 in the Caspian regions enabled him to establish a tenuous hold on the western Caspian shores and a claim to the southern shores of the Caspian as far eastward as Astrabad (Gorgan). In 1724 Russia and Turkey recognized one another's spheres of influence in Transcaucasia, but the situation remained unsettled and Russia was unable to make a major effort in this theatre of operations.

The War of 1735–39.—With the revival of Persian power the Russian government curtailed its commitments in the Caspian area. By the Russo-Persian treaties of Resht (1732) and of Gandzha (1735), Russia withdrew by stages to the left bank of the Terek River, on condition that no third power (*i.e.*, Turkey) should annex the ceded territories. The Turks, however, resumed their eastward pressure in spite of the agreement of 1724 with Russia. In 1734 the Crimean Tatars actually violated the Russian frontier in an expedition to the Caspian, which provided the *casus belli*. Russia began hostilities against Turkey in autumn 1735.

Russian strategy under Field Marshal B. C. Münnich was at first directed against the Crimea and the Dnieper mouth in the campaigns of 1736–38, but in 1739 Russia reverted to the strategy of 1711 and sent an army through Polish territory to attack the Turks in Moldavia. On Aug. 28 (N.S.), 1739, the Turkish army was severely defeated at Stavuchany. The Austrians, however, who had allied themselves with the Russians in 1737, suffered defeats in Serbia and in the Danube Valley, and once again made a separate peace. All that Russia obtained by the Treaty of Belgrade (Sept. 18 [N.S.], 1739) was the destruction of Azov as a fortress and the recognition of Russian sovereignty over the territories of the Zaporozhian Cossacks, which Turkey had hitherto claimed.

The War of 1768–74.—Russian preoccupation with the affairs of central Europe prevented further activity in the south until after the end of the Seven Years' War. In 1768 the crisis in Poland over the Confederation of Bar (*q.v.*) enabled Turkey to demand that Russia, in accordance with the terms of the treaties of 1711–13, should abstain from interference in Poland's internal affairs. Russian strategy in this war was to concentrate on Azov and Taganrog (both conquered in 1769) and the penetration of Moldavia and Walachia. In 1770 Field Marshal P. A. Rumyantsev won substantial victories on the Larga and Kagula rivers in Moldavia, while in June a Russian squadron appeared in the Aegean—a novel departure. Russia would have been willing to conclude peace in 1770, but Austria and Prussia wanted to take advantage of the situation to make annexations at the expense of Poland, which Russia controlled indirectly. On July 6, 1771, the Austrian government made an agreement with Turkey, by which it undertook to seek a restitution of the Russian conquests to the Turks. Russia was therefore compelled, on the one hand, to buy off Prussian and Austrian hostility by cessions of Polish territory and, on the other, to seek a reasonable peace with Turkey. The Turks, however, were disposed to offer resistance in the talks held at Focşani (in Moldavia) and at Bucharest and to demand the restoration of Russian conquests.

With part of her diplomatic difficulties solved by the First Partition of Poland (1772), the Russian empress Catherine II ordered Rumyantsev to cross the Danube in 1773 and to engage the main Turkish forces; but the situation was difficult in view of the formidable rebellion of E. I. Pugachev (*q.v.*) on the lower Volga. In 1774, however, Rumyantsev crossed the Danube into Bulgaria and, on June 20 (N.S.), defeated the Turks decisively at Kozludzha (the modern Suvorovo). The Turks were therefore compelled to seek peace, which was concluded at Kuchuk Kainarji on July 21 (N.S.), 1774. The Russian frontier was advanced to the line of the southern Bug; the fortresses of Kerch and Yenikale at the eastern end of the Crimean Peninsula and that of Kinburn on the southern side of the Dnieper estuary were ceded to Russia; and Russia obtained the right to maintain a fleet on the Black Sea and vague rights of protection over the Christian population of European Turkey. The khanate of Crimea was declared to be independent of the Porte in all except religious matters.

The War of 1787–91.—Russia was now in a much stronger position to expand. In 1783 Catherine II, taking advantage of civil disturbances among the Tatars, annexed the Crimean peninsula and the Kuban territories of the khanate. Likewise in 1783 the policy of Peter I in the extreme south was resumed when the Georgian king of Kakhetia and Kartalinia (Kartlia), Erekle II, accepted Russian overlordship.

In 1787 disputes over fields of influence led to the delivery of a Turkish ultimatum demanding Russia's recognition of Turkish sovereignty in Georgia and the admission of Turkish consuls to the Crimea. The Turkish fleet attacked Kinburn without success in October 1787, but the war in the south brought complications in the north. Sweden declared war on Russia in July 1788, in order to obtain restitution of the territories ceded under the treaties of Nystad (1721) and Åbo (1743); and Prussian intrigues induced the Polish opposition to overthrow the pro-Russian regime in October. Austria, however, in alliance with Russia from 1786, had entered the war against Turkey.

The aim of the Russian campaign of 1788 was the capture of the fortress of Ochakov on the northern side of the Dnieper estuary, which fell to Gen. A. V. Suvorov in December. Suvorov heavily defeated the Turks at Focşani on Aug. 1 (N.S.), 1789, and again on the Rîmnic River on Sept. 22. The Russians thus came to control the lower reaches of the Dniester and of the Danube, on which their hold was confirmed by Suvorov's storming of Izmail on Dec. 22, 1790; but diplomatic circumstances complicated the military position. Sweden made peace with Russia in August 1790, but Prussia had formed an alliance with Turkey and, by the Convention of Reichenbach (July 1790), persuaded Austria to abandon the Russian side, with the result that Austria and Turkey concluded the Peace of Sistova in August 1791. Russia's greatest danger was that Great Britain, already allied with Prussia, would enter the war, which would make possible a coalition of Turkey, Great Britain, Poland, and Prussia. Pressure of British public opinion, however, compelled the younger Pitt to withdraw his ultimatum to Russia demanding the restoration of Ochakov to Turkey, while at the last moment Prussia's nerve failed.

Further Russian military successes in 1791 forced the Turks to sign the Peace of Iaşi (Jassy) on Jan. 9, 1792 (N.S.; Dec. 29, 1791 O.S.). By this treaty the terms of the Treaty of Kuchuk Kainarji were confirmed and the Russian frontier was advanced to the Dniester, while Russia restored Bessarabia, Moldavia, and Walachia to Turkey. Thus Russia was established on the Black Sea coast from the mouth of the Dniester to the Kerch Strait. Nevertheless, the Russian government was still embarrassed enough to cut its commitments and to agree with Prussia to further partition of Polish territory in 1792. Both in 1772 and in 1792 the Turkish campaigns had led to a contraction of Russia's invisible empire in Poland.

The War of 1806–12.—The next war was largely a product of French diplomacy in Turkey during the Napoleonic Wars (*q.v.*). Though Turkey's position in the Balkans was threatened by a rebellion of the Serbs (from 1804); Russia was involved in war against Persia in the Caucasus (also from 1804); and the Turks believed that, with French support, they might recover the Crimea from Russia. Turkey provoked Russia by deposing the hospodars of Moldavia and Walachia in summer 1806; the Russians invaded those principalities in November; and on Dec. 30 the Porte declared war on Russia. The Franco-Russian Treaty of Tilsit (1807) obliged Russia to evacuate the principalities and to promise

that war would not be resumed before April 1808 if peace with Turkey could not be achieved. Hostilities began again in March 1809, after the Russian emperor Alexander I's meeting at Erfurt with Napoleon (autumn 1808), when Napoleon renounced his claim to mediate between Russia and Turkey.

The complicating factor was that Alexander, apart from his war against Persia, could not concentrate large forces against Turkey when his relations with France were so tenuous. In 1811, with the prospect of an imminent Franco-Russian war, it was imperative that Russia should seek a quick decision. The Russian commander in chief, Field Marshal M. I. Kutuzov, defeated the Turks at Ruschuk (Ruse) on July 4 (N.S.), 1811, and then surprisingly withdrew. The Turks resumed their offensive across the Danube, whereupon Kutuzov sent a detachment to the right bank and cut off the Turkish line of retreat. On Dec. 9 (N.S.), 1811, the Turks capitulated at Slobozia and, by the Treaty of Bucharest (May 28, [N.S.], 1812), ceded Bessarabia to Russia and granted an amnesty and local autonomy to the Serbs, with whom Russia had been in close relations from 1807. Thus Russia was free from embarrassment in the south just before Napoleon launched his attack in summer 1812; and the new frontier on the Prut held out advantages for the future.

The War of 1828–29.—Russo-Turkish relations between the Treaty of Bucharest and the Convention of Akkerman (Oct. 7 [N.S.], 1826) are described in the appropriate section of the article EASTERN QUESTION. Since Turkey refused to honour that Convention, Russia opened an offensive in the Balkan theatre of operations on May 8 (N.S.; April 26, O.S.), 1828, and occupied the Danubian principalities without difficulty. The Russian forces under Gen. P. K. Wittgenstein crossed the Danube on June 8, took the fortress of Brăila on June 19, and marched forward as far as Varna (Oct. 11), but the year was too far advanced and Russian movement too sluggish for further operations. In the Caucasian theatre Gen. I. F. Paskevich, the conqueror of Yerevan from the Persians, advanced across the frontier and took the fortress of Kars on July 5, pressing forward into the pashaliks of Akhaltsikhe and Bayazid.

In the spring of 1829 Wittgenstein was replaced by Gen. I. I. Diebitsch as Russian commander in chief in Bulgaria. Diebitsch's instructions were to cross the Balkan Mountains with a flying column and seize Burgas; if the Turks then refused peace, he was to march on to Istanbul. In April 1829 the campaign was opened with the siege of the Danubian fortress of Silistria, while the small force of 40,000 under Diebitsch pressed forward to take Adrianople on Aug. 20. On the Caucasian front the Russian forces entered Erzurum on July 9 and were prepared to press advance as far as Trebizond (Trapzun). The Turks were thus in a very difficult position and were once more obliged to sue for peace, though the Russian Army in the Balkan theatre of war had been reduced by sickness to a mere 12,000 men.

The Treaty of Adrianople (Sept. 14, 1829) gave Russia all the islands in the mouth of the Danube and all the eastern shore of the Black Sea from Kerch Strait as far as the St. Nicholas Bay in the south, together with the fortresses of Anapa, Poti, Akhaltsikhe, and Akhalkalaki. Turkey recognized that the principalities of Georgia, Imeretia, Mingrelia, and Guria, together with the khanates of Yerevan and Nakhichevan, ceded by Persia by the Treaty of Turkmanchai (Feb. 22, 1828), formed part of the Russian Empire. The results were thus more important in Transcaucasia than in Europe. Russia was now firmly based beyond the Caucasus Range, though it was several decades before the local highlanders, especially the Circassians, were reduced to obedience.

The War of 1853–56.—For this war *see* CRIMEAN WAR. For the Treaty of Paris (1856), whereby Russia lost the Danubian Islands won in 1829, together with the southern part of the left bank of the Prut, *see* EASTERN QUESTION.

The War of 1877–78.—As a result of the Turkish refusal to comply with the demands of the Powers for reform in European Turkey (*see* again EASTERN QUESTION), Russia opened hostilities on April 24, 1877. The campaign was the first undertaken by the Russian Army after the Crimean War, and the military reforms instituted by the minister of war, Gen. D. A. Milyutin, had not had time to make their effect. For the Balkan theatre of operations 185,000 troops (including a few Rumanian battalions and about 7,500 Bulgarian volunteers) were made available under Grand Duke Nicholas (Nikolai) Nikolaevich, the emperor Alexander II's brother; and 144,000 of these were allotted to the striking force with 500 guns. The smallness of the force indicates that the Russian general staff intended to make a rapid penetration of European Turkey and force the Turks to make an early peace. In the Caucasian theatre only 58,000 men were allocated to the striking force under Grand Duke Michael (Mikhail) Nikolaevich.

The Turks were not as badly prepared for war as the Russians had supposed. Between 160,000 and 180,000 men were available for operations in Bulgaria, and the Turks frequently had better arms than the Russians. The Russians moreover were disturbed by internal differences in the high command; Grand Duke Nicholas was not an able commander, while native Russians were jealous of staff officers of Polish origin. The presence, moreover, of the emperor and of the tsarevitch with the army led to many recriminations.

The Russians at first achieved some successes. On the Caucasian front Bayazid fell on April 30 (N.S.) and Ardahan on May 17. On the Bulgarian front the Russians crossed the Danube in June, and a flying column under Gen. I. V. Gurko seized the Shipka Pass through the Balkan Range on July 19. At this point the Russian plans received a setback. On July 20 a Turkish force under Osman Pasha repulsed the Russians at Pleven (*q.v.*) and stemmed their advance. Attempts to break the resistance of Osman Pasha failed. The Russian assaults of July 30 and Sept. 11–12 were repulsed with severe losses. The Russian commander then called up Col. Count E. I. von Todleben, the engineer officer who had organized the defense of Sevastopol during the Crimean War, and Todleben pronounced in favour of a siege of Pleven. The other Turkish commanders did little to relieve the pressure on Osman Pasha, who had considerable doubts concerning the order to hold on to Pleven. In the end Osman perceived that his position was hopeless and attempted to break through the Russian cordon but was defeated and compelled to surrender (Dec. 10, 1877). In the meantime Kars had fallen on the Caucasian front on Nov. 18. The Russians could now execute the original plan of penetration deep into European Turkey: passing the Balkan Range, they took Adrianople on Jan. 20, 1878.

The British Cabinet then ordered the Mediterranean fleet to steam through the Dardanelles and anchor at Istanbul. Undeterred by the British action, the Russian Army advanced on Istanbul as far as the Chatalja (Catalca) lines. Eventually the Russians agreed to a truce and, on March 3, concluded with Turkey the Treaty of San Stefano, but the provisions of this treaty were annulled by the Congress of Berlin (*q.v.*).

RUST, a term usually applied to the reddish deposit formed on iron in moist air. It has a variable composition, chiefly approximating $Fe_2O_3 \cdot H_2O$.

See also CORROSION AND OXIDATION OF METALS. For a description of plant rusts *see* FUNGI: *Classification: Basidiomycetes* (*Club Fungi*).

RUSTAVI, a town in the Georgian Soviet Socialist Republic, U.S.S.R., lies 26 km. (16 mi.) SE of Tbilisi (Tiflis) on the left bank of the Kura River. Pop. (1959) 62,395. The town developed after World War II with the establishment there of a fully integrated iron and steel works. Based on ore from Dashkesan in Azerbaijan, the plant supplies rolled steel and steel tubes to the whole Transcaucasus area. Rustavi lies on the main Tbilisi-Baku railway. The town is the centre also of an important agricultural region based on irrigation and it has several small food-processing industries. (R. A. F.)

RUSTICATION, in architecture, a form of masonry in which the stones have their edges cut back to a careful plane surface but with the central portion of the stone face either left rough or projecting markedly. Rusticated masonry is found in the platform of the tomb of Cyrus at Pasargadae in Persia (560 B.C.) and is common in certain types of Greek and Hellenistic work, such as retaining walls and the like. It was similarly used for terrace and retaining walls by the Romans, who also realized its decorative value and employed it not only for such utilitarian works as the Pont du Gard at Nîmes, France, and the aqueduct at Segovia, Spain (*c.* 109), but also decoratively as in the Porta Maggiore at Rome (time of Claudius), where the rustication is very rough, and the walls of the temple of Augustus at Vienne, France (*c.* 41), in which the rustication is carefully finished, the faces of the stone cut to a plane, and the edges very delicately sunk.

The early Renaissance architects developed this tradition still further and in the 15th-century palaces in Florence used it with magnificent effect. Thus in the Pitti palace by Brunelleschi (1458), the Medici-Riccardi by Michelozzo di Bartolommeo (1444–52), and the Strozzi by Benedetto da Majano (1489), the carefully studied rustication forms the chief element in the design; and in the Rucellai, from designs by Alberti (1446–51), the wall surfaces between the pilasters are delicately rusticated. During the Baroque period rustication assumed great importance in garden and villa design, and fantastic surfaces were employed on the projecting portions of the stones, such as vermiculated work, in which the surface is covered with wavy and serpentine sinkages like worm-eaten wood or treated with vertical dripping forms like lime deposits from dripping water. Sometimes the stones had sides beveled and brought to a point or ridge in the centre.

The use of rustication was introduced into England by Inigo Jones, as in the gate of the Botanic Gardens at Oxford (1632), and became a dominant feature in much English Renaissance work. In American colonial work this influence is seen in the occasional shaping of outside sheathing boards to imitate rusticated masonry, as in portions of the Morris-Jumel house in New York (1765). Quoins, or corner blocks, are, in many styles, rusticated, where the face of the wall is left smooth.

RUTABAGA: *see* TURNIP.

RUTACEAE, a family of dicotyledonous plants, mostly shrubs and trees, comprising about 144 genera and 1,600 species, found in temperate and tropical regions, and especially abundant in Australia and southern Africa. *Ruta graveolens* is rue (*q.v.*). *Citrus* includes the grapefruit, orange, lemon (*qq.v.*), etc. *Chloroxylon swietenia* is satinwood; *Ptelea trifoliata* is shrubby trefoil or wafer ash; *Zanthoxylum americanum* is prickly ash (*q.v.*).

RUTBAH WELLS (AR RUTBAH), a small oasis in the desert of western Iraq. It lies almost equidistant between Baghdad and Damascus in the Wadi Harwan and is the westernmost major settlement in Iraq. It long possessed a certain utility as a watering point on the ancient route, which is now followed by a modern surfaced road, but grew in importance with the establishment of new frontiers after 1918, when it became an Iraqi control post for travelers from Syria, Jordan, and Saudi Arabia. It was a pumping station on the Haifa branch of the Iraq Petroleum Company's oil pipeline (closed in 1947) from Kirkuk; the pipeline is also paralleled by a road direct from Kirkuk. (W. B. FR.)

RUTEBEUF (RUTEBUEF; RUSTEBUEF) (fl. 1248–1277?), French poet whose works, which include social, political, and religious satire, verse *contes* and *fabliaux,* laments, crusading poems, saints' lives, a miracle play, hymns to the Virgin Mary, and personal lyrics, bear the impress of a talented, complex, and original personality. Probably of *champenois* origin, he lived mainly in Paris, but his name, certainly a pseudonym, is nowhere mentioned by his contemporaries, and knowledge of him is derived from his poems, written between 1248 and 1277 or, possibly, 1285. There is evidence that much of his work—especially the narrative poems and the miracle play—influenced later writers; but his significance lies chiefly in the fact that in him is first powerfully heard, in France, the voice of popular opinion. His pungent commentaries are directed at virtually every order of society—even the highest, including Louis IX and the pope himself, do not escape criticism.

As with later pamphleteers and political columnists, it is not easy to say how far his work reflects, and how far it creates, public opinion. However, the consistency of his views over a long period argues a certain independence of mind; and the high rank of some of his patrons, among them the king's brother, Alphonse, count of Poitiers, suggests that his talents may have been recognized as a powerful means of courting public opinion, and implies that that opinion was a factor to be reckoned with.

In fact, the key to his attitude is to be found in his personal and professional loyalties, and in his innate humanity and sense of justice. Himself a penniless scholar—he foreshadows François Villon in the keen observation and humanity of his sketches of the seamier side of Paris life—Rutebeuf remains the champion of the University of Paris (*q.v.*) against the mendicant orders. It is significant, too, that his hatred of the mendicants appears to date from 1254, when he espoused the cause of Guillaume de St. Amour, the leader of the secular masters, against the Dominicans. Again, his enthusiasm for the Crusades is at least partly explained by his attachment to particular individuals—Geoffroi de Sergines, Eudes de Nevers, and Erard de Valéry, for example.

Rutebeuf's is a reforming, rather than a revolutionary, zeal: he attacks not institutions but the individuals who betray them. Above all, whether or not he led popular opinion in 13th-century France, his work is the most eloquent surviving expression of it.

The Poems.—Rutebeuf's surviving poems—55 written between 1248 and 1277, and one possibly in 1285—have been preserved in 12 manuscripts. The greatest number consist of satires and polemical poems on the church, the university, and the friars, and include *Le Dit des Cordeliers,* written at Troyes (1249); *La Descorde de l'Université et des Jacobins* (1264); the *Dit de Guillaume de St. Amour* and the *Complainte de Guillaume de St. Amour;* the *Dit des Règles,* on the occasion of Alexander IV's order to destroy pamphlets against the Dominicans; *Le Dit de Sainte Église,* written when the university attempted to persuade the king to recall Guillaume from exile; *Le Dit d'Hypocrisie,* on the election of Urban IV; and *La Vie du Monde* (1285?). His poems on the Crusades include a call to aid Geoffroi de Sergines at Acre (1255–56); *La Complainte de Constantinople* (1262), on its capture from the Latins by Michael Palaeologus; *La Complainte d'Outremer* (1266) and *La Nouvelle Complainte d'Outremer* (1277), in which he takes to task all grades of society for their lack of zeal for the Crusades (but in *La Disputaison du Croisé et du Décroisé,* 1267?, he represents fairly the views, both of the "crusading party," and of those who, like Jean Joinville [*q.v.*], felt that their duty to God and their neighbour could best be discharged in France); several *Complaintes* on the deaths of noble patrons on the Crusade; poems in support of Louis IX's second Crusade (*La Voie de Tunes,* 1267) and even of Charles of Anjou's (Charles I of Naples and Sicily, *q.v.*) adventure (Crusade so-called) in Sicily (*Chanson de Pouille* and *Dit de Pouille,* 1264–66). The personal poems (*La Griesche d'hiver* and *La Griesche d'Esté,* 1261; *Le Mariage Rutebeuf,* 1262?; *La Paix Rutebeuf* and *La Povreté Rutebeuf,* 1276–77?) give poignant expression, not untinged with sardonic humour, to the sufferings of Rutebeuf and others of his class. The religious poems include two saints' lives and a number of works in honour of the Virgin, to whom he seems to have been especially devoted: hymns (*l'Ave Maria Rutebeuf*) and two miracles—one, *Le Sacristain et la Femme du Chevalier,* in the form of a verse *conte,* while relating a typical story of an intervention of the Virgin in favour of a devotee, is also a light-hearted satire on the clergy; the other, *Le Miracle de Théophile,* is one of the earliest miracle plays (*see* DRAMA: *Medieval Drama*), on the traditional theme of the priest who sells his soul to the devil and is saved by the Virgin. Finally, the humorous poems include *fabliaux* (*La Dame qui fist trois tours entour le Moustier, le Pet au Vilain, Le testament de l'Âne*); *Le Dit de l'Herberie*—a parody on a charlatan's patter; and personal satires against some of his *confrères* (*Charlot le Juif et la Peau du lièvre* and *Charlot et le Barbier,* etc.).

All Rutebeuf's poems may be described as occasional poetry, although the occasions differ. His most characteristic notes are biting satire and personal involvement. His learning is wide, and

many of his poems are based on Latin originals. He handles with skill a wide range of verse forms, but his outstanding gift is his power to use everyday language, vivid imagery, colloquial phraseology, and proverbial wisdom to express both his own personality and public opinion.

See *Les Oeuvres complètes de Rutebeuf,* ed. by E. Faral and J. Bastin, 2 vol. (1959). (H. H. Lu.)

RUTH, BABE (George Herman Ruth) (1895–1948), U.S. baseball player, the game's most popular figure and holder of the all-time home-run record of 60 in a 154-game season (1927), was born on Feb. 6, 1895, in Baltimore, Md., into a poverty-stricken environment. At age seven he went to live at St. Mary's Industrial school in Baltimore, where he spent much of his boyhood and where he first became interested in athletics.

The "Sultan of Swat" hit a total of 714 home runs in 22 big league seasons. He finished with a lifetime batting average of .342, but of all his records he was proudest of having pitched 29⅔ scoreless innings for the Boston Red Sox in the world series—against the Brooklyn Dodgers in 1916 and the Chicago Cubs in 1918. He was the best left-handed pitcher in the American league when he was moved to the outfield because of his slugging.

Ruth batted and threw left-handed. He stood 6 ft. 2 in. and weighed 215 lb. He began his professional career at Baltimore in 1914 and was sold later that season to the Boston Red Sox for an estimated $2,900. In Jan. 1920 Ruth was sold to the New York Yankees for $125,000. During his major-league career Ruth broke more than 50 records. He led the American league in home runs for 12 years; he hit at least 50 home runs in four separate seasons and at least 40 in each of 11 seasons. He played in ten world series—three with the Red Sox and seven with the Yankees.

In 1922 he was suspended for 30 days for an unauthorized barnstorming tour. In 1925 he was fined $5,000 by Yankee manager Miller Huggins for "misconduct off the ball field." In 1930 and 1931 Ruth received a salary of $85,000 per season, then the all-time high. He played his last season (1935) with the Boston Braves, was released June 2, 1935, and concluded his baseball career as coach of the Brooklyn Dodgers in 1938. He was one of the first five players elected to Baseball's Hall of Fame at Cooperstown, N.Y., in 1936. Ruth died on Aug. 16, 1948, in New York city. In 1961 Roger Maris of the New York Yankees hit 61 home runs, a record for the 162-game baseball season, but because Maris hit only 59 in the first 154 games of the season Ruth's record stood. (J. D. McC.; X.)

RUTH, BOOK OF, in the Old Testament, the story of Ruth, the Moabite great-grandmother of David. It belongs to the third division of the Hebrew Bible, the Writings, or Hagiographa. It is one of the five festal Rolls (Megilloth): Song of Solomon (Song of Songs), Ruth, Lamentations, Ecclesiastes, and Esther; in the Septuagint, Vulgate, and English versions, however, it follows the Book of Judges.

Contents.—The book falls into fairly well-defined sections:

1:1–5	Elimelech of Bethlehem, with his wife, Naomi (Noemi), and his two sons, Mahlon and Chilion, sojourned in Moab. After his death his sons married Moabite women, Ruth and Orpah, respectively. In about ten years the sons died also
1:6–18	Orpah returned to her own people, but Ruth elected to remain with Naomi
1:19–22	Naomi and Ruth returned to Bethlehem
2:1–23	there Ruth met Boaz (Booz), a kinsman of Elimelech, while gleaning in his field
3:1–5	Naomi, to provide for Ruth, planned that Boaz should marry her
3:6–18	Naomi sent Ruth to the threshing floor at night to claim Boaz' protection
4:1–12	after a nearer kinsman forfeited the right to marry Ruth and redeem the land of Elimelech, Boaz performed the obligation
4:13–17	to this union was born Obed
4:18–22	David's genealogy is given from Perez through Boaz, Obed, and Jesse

Purpose.—Many purposes have been assigned to the book: to entertain, to delineate the ancestry of David, to uphold levirate marriage as a means of perpetuating a family name (*see* Levirate), to commend loyalty in family relationships, to protest the narrowness of Ezra and Nehemiah in relation to marriages with non-Jews, to inculcate kindness toward converts to Judaism, to teach that a person who becomes a worshiper of Yahweh will be blessed by him, and to illustrate the providence of God in human affairs. The book may have served all these "purposes," but the author's objective cannot be determined with certainty. His broad outlook regarding foreigners is akin to that found in Isa. 56:3–8 and Jonah.

Literary History.—This little gem has been called an idyll, a short story, literal history, and pure fiction. It is best classified as a short story based upon a solid core of fact: no one would have invented a Moabite ancestress for Israel's greatest king. The work has been variously dated in the time of David, in the later monarchy, and in the postexilic period. It cannot be earlier than David (4:17). Light from archaeology on the Hebrew language and on marriage customs suggests a preexilic date for the bulk of the story. However, the book probably reached its final form in postexilic times since the writer knew the Deuteronomic edition of Judges (1:1; Judg. 2:16, 18), and 4:7 gives the impression that the custom mentioned therein was already obsolete. Many have regarded 4:18–22 as a gloss (*cf.* I Chron. 2:4–15).

Interpretation and Use.—Literally speaking, the marriage of Boaz and Ruth (ch. 4) was not a levirate marriage (Deut. 25:5–10), because Boaz was not Ruth's *levir* (brother-in-law). It was probably a forerunner of levirate marriage (*cf.* Gen. 38; 19:30–38), though it may have been an extension of the levirate principle to more distant kinsmen. The association of levirate marriage with the redemption of property was inevitable. The spirit of the book stands in contrast to Deut. 23:3 (*cf.* Neh. 13:1–3), which prohibits a Moabite from entering the assembly of the Lord, and to the severe marriage reforms of Ezra (Ezra 9–10) and Nehemiah (Neh. 13:23–31). The story of Ruth may represent a pre-Deuteronomic point of view concerning Moabites; yet it may have been retold in such a way as to be a subtle polemic against exclusiveness in the postexilic community. In any case, it is probably significant that Ruth was already a convert to Yahwism at the time of her marriage to Boaz (1:16; 2:12). Cultic interpretations, which find the origin of the story in fertility myths and rituals, have received meagre endorsement.

The book has enjoyed a degree of popularity in Judaism, Roman Catholicism, and Protestantism. It is read in Judaism as a part of the liturgy on Pentecost. "The Lord be with you" of Boaz (2:4) is repeated eight times in the Latin Mass, and the words of Naomi (1:20) and Ruth (2:13) are used in responsories. Ruth's moving commitment to Naomi (1:16–17) is sometimes found in Protestant wedding ceremonies. *See* also Bible.

RUTHENIA: *see* Transcarpathian Oblast.

RUTHENIUM is one of the platinum metals and resembles platinum in its silver-gray colour and lustre. It is found in small percentages in a number of platinum ores. It was identified as a chemical element in 1844 by Carl Claus, in Russia, and was the last of the platinum metals to be characterized. (*See* Platinum Metals.) The name was selected in honour of Russia (Latin, Ruthenia) by G. W. Osann in 1828, when he made a premature announcement of the discovery of the element in platinum ore from the Ural Mountains. Although Osann's announcement was never confirmed, Claus retained the name.

Among the metals of the platinum group, only osmium is more infusible than ruthenium; the melting point of ruthenium is 2,450° C., and its boiling point, which can only be surmised, is estimated to be above 2,700° C. Because of the high melting point, ruthenium is not easily cast; its brittleness, even at a white heat, makes it very difficult to roll or draw into wires. Thus the industrial application of ruthenium is restricted to use as an alloy for platinum and other metals of the platinum group. It serves the same

function as iridium for the hardening of platinum and, in conjunction with rhodium, is used to harden palladium. Ruthenium-hardened alloys of platinum and palladium have been found much superior to the pure metals in the manufacture of fine jewelry.

The chemical symbol of ruthenium is Ru, atomic number 44, atomic weight 101.07, specific gravity about 12.41. Ruthenium is one of the group of more than 30 elements whose radioactive isotopes are formed when uranium and plutonium atoms disintegrate by the fission process. One of these ruthenium isotopes (Ru^{106}) emits beta rays with a half-life of one year to yield a daughter, rhodium-106, which is also radioactive. Rh^{106} emits high-energy beta rays and gamma rays with the half-life of 30 seconds. This pair of isotopes contributes an important fraction of the residual radiation from uranium or plutonium fuels of fission-type atomic reactors which have "cooled" for a year following their use. The separation of ruthenium from the fissionable elements must be effected before these expensive fuels can be recovered and reprocessed to attain economically competitive atomic power. The chemical effects and hazards of intense radiation impose severe difficulties on the separation process. Similarities in the chemical behaviour of plutonium and ruthenium, in many cases, make the separation even more difficult.

Ruthenium metal is not attacked by air in the cold. Heated in air or oxygen from about 700° to 1,200° C., the powdered metal yields a dark blue dioxide, RuO_2, which decomposes at still higher temperatures. The element effectively resists attack by strong acids, even by aqua regia which readily dissolves platinum and gold. Ruthenium metal and the mineral alloys of ruthenium, osmium, and iridium are most easily brought into soluble form by fusion with an alkaline oxidizing flux. Compounds, such as K_2RuO_4 (+6 state) and $KRuO_4$ (+7 state), are formed. When these compounds dissolve in aqueous systems, they usually decompose rapidly to lower oxidation states. Like all platinum elements, ruthenium can be readily reduced from its compounds to give free metal. Separation of ruthenium from other heavy metals is conveniently achieved by forming the tetraoxide, RuO_4, which is so volatile it readily distills from aqueous solutions. Osmium is the only other element which can form so high an oxidation state. However, OsO_4 is formed more readily and can be distilled from nitric acid alone. The formation of RuO_4 requires stronger oxidizing agents, such as bromate ion in acids or chlorine in alkaline solutions. RuO_4 is the only known compound of the element with the +8 oxidation state. It must be handled cautiously, for it is extremely poisonous, and above 100° C. it may decompose explosively. Although evidence for compounds of ruthenium in every oxidation state from 0 through +8 has been claimed, the +3, +4, +6, and +8 states are the most important.

The +3 and +4 oxidation states include numerous coordination complexes in which water or ammonia molecules, chloride ions, or other groups are bonded covalently to a central ruthenium ion. Typically, six atoms bond to ruthenium, and the complexes are the inert type, in that groups are not replaced rapidly. Many of these coordination complexes possess striking colours, which facilitate chemical studies. The +3 or +4 oxidation states are readily interconvertible so that frequently in the past, errors have been made in the assignment of state to a particular compound; *e.g.*, the compound which Claus originally thought was $K_2[RuCl_5]$, +3 state, proved to be $K_2[RuCl_5(OH)]$, +4 state. Exceptionally stable nitrosoruthenium compounds, containing NO groups bonded to the ruthenium ion, frequently form in the presence of nitric oxide, NO, or nitrate ion. Indeed, a salt which early workers believed was $K_2[RuCl_6]$ was later shown to be $K_2[RuCl_5(NO)]$. More nitroso compounds are known for ruthenium than for any other element.

Solutions of ruthenium compounds with many reducing agents, such as zinc or hydrogen sulfide, give blue solutions containing the +2 state. A compound, $K_4[Ru(CN)_6]$, is an analogue of the familiar iron (II) compound. The carbonyl, $Ru(CO)_5$, represents the zero state. The only compound in the +5 state is the fluoride, RuF_5, prepared by the reaction between the elements.

(D. S. Mn.)

RUTHERFORD, ERNEST RUTHERFORD, 1st Baron, of Nelson and Cambridge (1871–1937), British physicist, winner of the Nobel Prize in Chemistry for 1908, whose researches in radiation and atomic structure were basic to the later 20th-century developments in nuclear physics. Born at Nelson, N.Z., on Aug. 30, 1871, he received his secondary training at Nelson College and, on graduation in 1889, gained a scholarship at Canterbury University College, Christchurch. By 1893 he had taken his M.A. degree with a double first in mathematics and physics.

In 1895 Rutherford won an 1851 exhibition scholarship which took him to Cambridge University. At the Cavendish Laboratory his ability was recognized at once by J. J. Thomson. His earliest product there was a detector for electromagnetic waves, its essential feature being a small magnetizing coil containing a tiny bundle of magnetized iron wire. Rutherford's second piece of work, done jointly with Thomson, dealt with the temporary conduction in gases which results from ionization produced by X-rays.

THE BETTMANN ARCHIVE INC.

BARON RUTHERFORD OF NELSON

In 1897 Rutherford worked with Thomson on topics related to the mobility of ions, but especially upon the negative ions emitted when ultraviolet light falls upon a clean metal surface. The discovery of Becquerel rays and radium had aroused his curiosity as to just what kind of ions are emitted by radium. At this juncture Rutherford accepted a call to McGill University, Montreal, Que. On reaching the Macdonald Laboratory there, in the autumn of 1898, he at once continued work begun at Cambridge on the radiation from radium, and reported in 1899 that it is quite complex, consisting first of all of easily absorbed rays—rays which are stopped by a few centimetres of air. These he called alpha rays. Besides these, he found uranium giving a far more penetrating radiation, able to pass through a sheet of aluminum several millimetres thick. These he named beta rays, and they proved to be high-speed electrons (*see* Radioactivity).

Rutherford's next work at Montreal was done jointly with R. B. Owens. It was a study of thorium emanation, which led to the discovery of a new noble gas, an isotope of radon, later known as thoron. After Frederick Soddy came to McGill University in 1900, he and Rutherford created a modern theory of radioactivity, excellently set forth in Rutherford's *Radioactive Substances and Their Radiations.*

In 1907 Rutherford accepted an invitation to succeed Sir Arthur Schuster in the Langworthy professorship at Manchester University. It was about this time that he and J. T. Royds showed that alpha particles consist of helium atoms. The Nobel Prize was presented to Rutherford on Dec. 11, 1908, two years before he began thinking about the scattering of alpha rays and the nature of a nucleus which could produce such scattering—his nuclear theory—the greatest of all his contributions to physics. In 1912 Niels Bohr came to work in the Manchester laboratory, and it was there that Bohr adapted the nuclear structure of Rutherford to the quantum theory of Max Planck and thus theorized an atomic structure which satisfied the experimental findings of J. R. Rydberg and other spectroscopists. About this time H. G.-J. Moseley got in touch with Rutherford and worked with him during the year 1913. Moseley bombarded the atoms of various elements with cathode rays (X rays) and showed that the inner structures of these atoms respond in groups of lines in the X-ray spectra which characterize the elements much as the natural numbers might do (*see* Moseley, Henry Gwyn-Jeffreys).

After World War I, during which he worked on methods of submarine detection, Rutherford succeeded, by the bombardment of

nitrogen with alpha particles, in transmuting the element nitrogen into an isotope of oxygen. (*See* NUCLEUS: *Description and History.*)

In 1919 Rutherford was invited to succeed Thomson in the Cavendish chair at Cambridge. Honours now came in rapid succession. Rutherford had been knighted in 1914. The Copley Medal of the Royal Society was bestowed on him in 1922; the presidency of the British Association for the Advancement of Science in 1923, to be followed, two years later, by the presidency of the Royal Society. In 1925 he was appointed to the Order of Merit. In 1931 he was created 1st Baron Rutherford of Nelson. He died at Cambridge on Oct. 19, 1937.

Rutherford, together with J. Chadwick and C. Ellis, wrote *Radiations From Radioactive Substances* (1930), a book so thoroughly documented that it serves most needs in the way of a chronological list of Rutherford's published papers.

RUTHERFORD, MARK (pen name of WILLIAM HALE WHITE) (1831–1913), English writer, distinguished as a novelist, critic, and religious thinker, was born at Bedford on Dec. 22, 1831, the son of William White, printer, book-seller, member of the Bunyan meeting, prominent citizen, and Whig, who later became well known as doorkeeper of the House of Commons.

The story of Hale White's inner life is of unusual interest, and is largely told in his novels and other writings; outwardly his life was uneventful. He was trained for the Congregational ministry at Cheshunt College, and later at New College, London, where he was one of three students expelled for heresy after an examination about the inspiration of Scripture. The rest of his life, after a spell of journalism, was spent in the civil service (the Admiralty). The books by which he is best remembered all appeared under the name of "Mark Rutherford," and so completely did he conceal his authorship that even his immediate circle knew nothing of it for years. *The Autobiography of Mark Rutherford* appeared in 1881; *Mark Rutherford's Deliverance* in 1885; *The Revolution in Tanner's Lane* in 1887. These were followed by *Miriam's Schooling and Other Papers* (1890), *Catherine Furze* (1893), and *Clara Hopgood* (1896).

Hale White has been called "a minor George Eliot": "minor" because of his slender output and meagre inventiveness as a novelist, but a "George Eliot" in the truth and insight with which he renders the life and religion of mid-Victorian provincial society. What George Eliot did for rural and small-town Anglicanism, he did for Bedford nonconformity. Both were refugees from provincial ignorance and religious decadence; both sought the larger, freer life of nature, books, and educated companionship; yet both found in their early memories the richest source of literary material. Both, in maturity, brought a deep and sympathetic understanding to the portrayal of the life and worship they had transcended. Hale White lacks George Eliot's copiousness and breadth, but the quiet intensity of everything he wrote gives him a place among the best stylists of his time. "His art," said André Gide, "is made of the renunciation of all false riches"; it was the utterance of a man acquainted with grief and doubt, yet habituated by Puritanism to self-control and veracity. Hale White was representative of the many "escaped Puritans" of the 19th century who, though deeply religious to the last, had ceased to be orthodox. All his books deal with spiritual problems, with ordeals of the heart, the intellect, or the conscience; and nearly all present, against a provincial background sketched with restrained irony and humour, some "superior" person at war with circumstance, yet no less at war with his or her own spiritual pride and seeking for repentance and reconciliation. Hale White died at Groombridge, Sussex, on March 14, 1913, after a short second marriage which brought him unlooked-for happiness at the close of a life predominantly sad.

BIBLIOGRAPHY.—*Works:* A translation of Spinoza's *Ethics* (1883), *John Bunyan* (1904), and *The Early Life of Mark Rutherford* (1913) appeared under his own name. Selections from his private journals (described as "by Mark Rutherford") were: *Pages from a Journal* (1900); *More Pages*, etc. (1910); and *Last Pages*, etc., ed. by his widow, Mrs. D. V. White (1915). *See* also *Letters to Three Friends* (1924) and *The Groombridge Diary* (1924), both ed. by Mrs. White. *Criticism and Biography:* W. H. Stone, *Religion and Art of William Hale White* (1954); C. M. Maclean, *Mark Rutherford* (1955); Irvin Stock, *William Hale White (Mark Rutherford)* (1956); Basil Willey, *More 19th-Century Studies* (1956). (B. Wy.)

RUTHERGLEN (locally pronounced *Rŭglen*), a royal and large burgh of Lanarkshire, Scot., 3 mi. SE of Glasgow, on the left bank of the Clyde. Pop. (1961) 25,067. Area 1.6 sq.mi. It is connected with the east of Glasgow by two bridges. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I, by which Sir John Menteith undertook to betray William Wallace to the English. Rutherglen was erected into a royal burgh by David I in 1126 and claims to be the oldest in Scotland. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the city, and Rutherglen continued to resist incorporation with Glasgow. In early times it had a castle, which after the Battle of Langside (1568) was burned by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen. The collieries in the area were worked out; the principal industries now include chemical works, paper mills, laundries, and oatcake bakeries, and the making of fireplaces, chairs, and textiles, and light and structural engineering.

RUTHIN (RHUTHUN), a market town and municipal borough (1282) of Denbighshire, Wales, lies 8 mi. SE of Denbigh. Pop. (1961) 3,502. It stands on a hill above the Clwyd River and is the administrative centre for Denbighshire. Though the borough was incorporated under a charter of Edward I, the natives were excluded from its privileges until Henry VII, who was himself of Welsh descent, confirmed the charter and made the borough "free." The castle was founded in 1281; it was unsuccessfully besieged by Owen Glendower in 1400, and in 1646 it was demolished by order of Parliament. The ruins stand in the grounds of a hospital built in 1826–52. St. Peter's Church, made collegiate in 1310 by Lord Grey of Ruthin, has a roof of black oak divided into about 500 small panels; the incumbent is known as the warden. The old buildings of the grammar school, founded in 1574, are known as the Ellinor Roberts Memorial Buildings. Nantclwyd House, with its fine medieval hall, has been used as judges' lodgings from *c.* 1400. Ruthin has a mineral water (soft drink) industry.

RUTHVEN, the name of a Scottish noble family allegedly tracing descent from a certain Thor who flourished during the reign of David I (1124–53). In 1488 one of its members, SIR WILLIAM RUTHVEN (d. 1528), was created a lord of Parliament as Lord Ruthven.

PATRICK (*c.* 1520–66), 3rd Lord Ruthven, and his second son WILLIAM (*c.* 1543–84), the 4th lord, were prominent in the political intrigues of their time. Both belonged to the Protestant Party and neither was averse to using violence to accomplish his political ends. Having been one of the leaders of the reforming opposition to the regent Mary of Lorraine, the 3rd lord was prominent in arranging the marriage (1565) between Mary Stuart and Lord Darnley. In 1566 he rose from a sickbed to lead the murderers of the queen's secretary, David Rizzio, after which he fled to England where he died in the same year. His *Relation of the Death of David Rizzi* is preserved in the British Museum (MS. Cotton, Cal., B, ix) and was first printed in 1699. His son, the 4th lord, created earl of Gowrie (1581), was also concerned in the Rizzio murder. For a time he had charge of Queen Mary at Lochleven, and he was the last known custodian of the famous "casket letters" (*q.v.*). In 1582 he was the principal actor in the raid of Ruthven which took the young king James VI out of the hands of the favourites Lennox and Arran and two years later a further abortive plot led to his trial and execution. His second son was JOHN RUTHVEN, 3rd earl of Gowrie (*q.v.*), whose death and forfeiture involved the ruin of the family.

PATRICK RUTHVEN (*c.* 1573–1651), descendant of the 1st Lord Ruthven in a collateral line, distinguished himself in the service

of Sweden (*c.* 1606–38). He was then employed by Charles I in Scotland where in 1640 he for a time defended Edinburgh Castle against the Covenanters. On the outbreak of the Civil War he joined the king at Shrewsbury and after the Battle of Edgehill (October 1642) was appointed general-in-chief of the royalist army. He compelled the earl of Essex to surrender at Lostwithiel (September 1644) and was wounded at both battles of Newbury (1643 and 1644). In November 1644 he was superseded in his command by Prince Rupert but continued to play an active part in royalist affairs until his death at Dundee in 1651. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642, and earl of Brentford in 1644.

In 1651 SIR THOMAS RUTHVEN (d. 1671), a collateral descendant of the 2nd lord Ruthven (d. 1552), was created Lord Ruthven of Freeland. The present earls of Gowrie are descended from this branch through the female line. (J. K. BA.)

RUTILE is the most abundant of the three native forms of titanium dioxide, the others being anatase and brookite (*q.v.*). Ordinary rutile is red or brown (hence the name from the Latin *rutilus*, "red").

Rutile, with the composition TiO_2, is a commercially important titanium mineral (*See* TITANIUM: *Occurrence; Compounds*), although commercial TiO_2 is produced largely from ilmenite (*q.v.*), or titanic iron ore. Rutile has minor uses as a colouring agent in porcelain and glass, and in certain steels and copper alloys. Synthetic rutile, superior to natural crystals as a gem, is produced by the flame fusion (Verneuil) process. The boule as it comes from the furnace is black and is deficient in oxygen. Subsequent heating in an electric furnace in an atmosphere of oxygen produces a clear material. However, because of the high absorption of light in the violet end of the spectrum, the material has a yellow tinge. It has a very high index of refraction and high dispersion, hence shows "fire" and brilliance like the diamond, but is of inferior hardness. Synthetic gems can be produced in various colours by adding appropriate metal oxides to the original titanium dioxide. (*See* also GEM: *Synthetic Gems.*)

Like anatase, rutile crystallizes in the tetragonal system, but with different angles. It is isomorphous with cassiterite, SnO_2, the common ore of tin, which it resembles in crystal form, twinning, colour and streak, which is pale brown to yellow. The specific gravity is lower, being 4.2 in contrast to 7.0 for cassiterite. The hardness is 6 to 6.5. It is opaque, with a brilliant metallic to adamantine lustre. Some varieties contain significant amounts of iron, niobium, or tantalum and are black, with a specific gravity as high as 5.5. Oriented microscopic crystals of rutile produce asterism in phlogopite, ruby, and sapphire. The term sagenite is applied to needlelike crystals twinned to form reticulated, or netlike, skeletal plates. Rutilated quartz is rock crystal containing long delicate translucent needles of rutile. Venus's-hairstone (Pliny's *Veneris crinis*) refers to similar needles in smoky quartz.

Rutile is an accessory mineral in igneous rocks, but is more common in schists and gneisses. It is found in some pegmatites and in crystalline limestones. It occurs in apatite veins in Norway, where it is mined. Microscopic needles of rutile are of wide distribution in clays and shales and also in slates. It is common in detrital deposits, as in Florida sand deposits. Australia is the chief producing country. (L. S. RL.)

RUTILIUS CLAUDIUS NAMATIANUS (fl. A.D. 417), Roman poet, author of an elegiac poem *De reditu suo* describing a journey from Rome to his native Gaul in the autumn of A.D. 417. The poem is chiefly interesting for the light it throws on the ideology of the pagan landowning aristocracy of the rapidly disintegrating western Roman Empire.

Rutilius was a native of southern Gaul (Poitiers, Toulouse, and Narbonne have all been suggested as his birthplace) and a member of one of the wealthy landowning families who almost monopolized high government office in the late empire. His father, Lachanius, had held provincial governorships, high financial and legal offices, and the prefecture of Rome. The poet himself was master of offices and later, in 414, prefect of Rome. Among friends whom he mentions, several are known to have held high office, and at least one was a close friend of Symmachus, leader of the pagan group in the Senate and patron of letters. Rutilius was clearly, like Symmachus, a pagan, out of sympathy with the government of Theodosius and Honorius, hostile to Stilicho's policy of rapprochement with the Goths, ready to support any usurper who looked like winning, and preoccupied with an idealized picture of the strength and justice of Rome which had little to do with the hard realities of the 5th century A.D.

The occasion of his journey was his return to his Gaulish estates, which had been ravished by Franks, Burgundians, and Visigoths in 412–414. Leaving Portus Romae (Porto, near Ostia) on Oct. 31, 417, he sailed up the Italian coast by short stages (the land route was unsafe since the Gothic invasion of 410), reached Faleriae (the medieval Porto Falese, now silted up) on Nov. 3, and Luna (on the Gulf of La Spezia) a few days later. Here the poem breaks off; only 68 lines of book ii are preserved.

The narrative is smooth and relaxed, full of personal observations, and giving the impression of a diary. Much of the poem is taken up by digressions occasioned by places or events of the journey, and it is in these that the attitudes and values of the poet and his circle find their clearest expression. Noteworthy is the stirring farewell to Rome (i, 47–164) in which Rutilius proclaims his faith in the perpetuity of the Roman Empire: "by permitting those whom you conquer to participate in your own right," he says, "you have made one city of what was a whole world" (*Dumque offers victis proprii consortia iuris, Urbem fecisti quod prius orbis erat*). These motifs have a long ancestry in Latin and Greek literature, and Rutilius draws upon many predecessors. Yet there can be no doubt of the sincerity of the faith which he proclaims so fervently. Other digressions deal with the harm done to Rome by the family of the Lepidi (i, 295–312)—a rather frigid piece of antiquarianism in the taste of the time; on the Jews (ii, 381–398); on the ruins of Populonia (i, 401–414); on monks (i, 439–448), whom Rutilius passionately hates; on his Gaulish friends Victorinus, a refugee from Toulouse (i, 491–510), and Protadius (i, 541–558); on the career of his father Lachanius (i, 575–596); on the shape of Italy (ii, 17–40); on the treachery of Stilicho and his responsibility for the capture of Rome by Alaric in 410 (ii, 41–60).

Rutilius writes Latin of unusual purity for his age, and his elegant and correct elegiac couplets bear witness to his close familiarity with the Augustan elegiac poets, particularly Ovid. A curious metrical feature is the unusually high frequency of spondees as first feet, especially in the pentameter. Rutilius is an accomplished and pleasing poet and, had more of his work survived, he might have vied with his contemporary Claudian for the title of last of the Roman poets.

Alfonsi in *Studi romani* 3:125–139 (1955). (R. BG.)

RUTLAND, EARLS AND DUKES OF. The English title earl of Rutland, held by members of the Manners family since the 16th century, was first granted in 1390 to EDWARD PLANTAGENET, 2nd duke of York (*q.v.*), a grandson of Edward III. By the terms of the grant, however, he was to hold the title only until his father's death (1402). The next acknowledged earl of Rutland was his great-nephew EDMUND (1443–1460), son of Richard, duke of York. Edmund was killed with his father at the battle of Wakefield in December 1460.

THOMAS MANNERS (*c.* 1492–1543), 12th Baron Ros (or Roos), a great-nephew of Edmund, was created earl of Rutland in 1525 by Henry VIII who also gave him various estates and properties, including Belvoir Castle which became the chief family seat.

HENRY (1526–1563), 2nd Manners earl of Rutland, his son by his second wife Eleanor Paston, held various military offices and in 1547, as lieutenant of the king's army in Scotland, captured and sacked Haddington. He died of plague and was succeeded by his son EDWARD (1549–1587), who fought against the rebel northern earls in 1569 and took part in the trial (1586) of Mary Stuart. As he left no son, the barony of Ros devolved on his daughter but he was succeeded in the earldom of Rutland by his brother JOHN (*c.* 1552–1588). John's son ROGER (1576–1612), 5th earl, took part in the Islands voyage (1597) led by Sir Walter Ralegh and Robert Devereux, 2nd earl of Essex, and was with Essex in Ireland (1599–1600). Implicated in the Essex plot of February 1601, he spent six months in the Tower. His wife was Elizabeth, daughter of Sir Philip Sidney. They had no children and Roger was succeeded by his brother FRANCIS (1578–1632). Francis succeeded his cousin as Baron Ros in 1618, but both his sons died young (allegedly by witchcraft) and while the barony passed to his only daughter, he was succeeded in the earldom by a third brother, GEORGE (*c.* 1580–1641).

George had no children and the next earl of Rutland was his second cousin JOHN MANNERS (1604–1679), a descendant of the 1st Manners earl. His son JOHN (1638–1711) supported the Revolution of 1688, and received Princess Anne at Belvoir Castle when she fled from London. When she became queen she created him marquess of Granby (Nottinghamshire) and duke of Rutland in 1703. His son JOHN (1676–1721), the 2nd duke, was a commissioner (1706) for the Union between England and Scotland. The 3rd duke, JOHN (1696–1779), son of the 2nd duke, was a lord of the bedchamber (1721–27) to George I and in 1745 raised a regiment of foot against the Jacobites. His son John (*see* GRANBY, JOHN MANNERS, Marquess of), who had a distinguished military career, predeceased him, and he was succeeded by his grandson CHARLES (1754–1787). Charles was lord steward of the household (February–April 1783), with a seat in the earl of Shelburne's cabinet; he was lord privy seal from December 1783 to February 1784 and lord lieutenant of Ireland from then until his death. His son JOHN HENRY (1778–1857), 5th duke, and his grandson CHARLES CECIL JOHN (1815–1888), 6th duke, both supported the Tory party, the latter leading the Protectionists after 1848. The 7th duke of Rutland, JOHN JAMES ROBERT MANNERS (*see* below), brother of the 6th duke, was a notable supporter of Disraeli and a leader of the "Young England" movement. His son HENRY JOHN BRINSLEY (1852–1925), 8th duke, was for a time principal private secretary to the marquess of Salisbury. His son was JOHN HENRY MONTAGU (1886–1940), 9th duke, and his grandson CHARLES JOHN ROBERT MANNERS (1919–) became the 10th duke.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818–1906), Conservative politician, exponent and last survivor of the "Young England" movement of the 1840s, was born at Belvoir Castle on Dec. 13, 1818, younger son of the 5th duke of Rutland. Educated at Eton and at Trinity College, Cambridge, he entered Parliament as Gladstone's colleague for Newark in 1841. Manners, together with George Smythe (later 7th Viscount Strangford), his closest friend, became a disciple of Disraeli who immortalized them as Lord Henry Sidney and Coningsby respectively in his famous novel *Coningsby: or, The New Generation*. The "Young England" group, as they came to be called, stood for a romantic Toryism, hostile alike to Manchester Radicalism, orthodox Whiggery, and Sir Robert Peel's Conservatism. The political counterpart of the Oxford movement, it looked back to an imaginary golden age in which aristocracy treated with benevolent paternalism a prosperous and grateful peasantry. Manners and Smythe opposed the middle class *bourgeoisie* and sought to ameliorate the condition of the working class in the industrial towns. Manners, together with Disraeli, supported a proposed ten hours' bill in 1844 (it became law in 1847) and opposed the repeal of the Corn Laws in 1846. He did not contest Newark in 1847, but sat for Colchester from 1850 to 1857, North Leicestershire from 1857 to 1885, and East Leicestershire from 1885 to 1888 when he succeeded his brother as duke. During the earl of Derby's ministries of 1852, 1858–59, and 1866–68 he was first commissioner of works. From 1874 to 1880 he was postmaster general in Disraeli's second administration and again in the marquess of Salisbury's first government (1885–86). He was chancellor of the duchy of Lancaster in Salisbury's second government (1886–92). He died at Belvoir Castle on Aug. 4, 1906. His only child by his first wife, Catherine Marlay, succeeded him as 8th duke of Rutland. By his second wife, Janetta Hughan, he had five sons and three daughters.

Lord John Manners has often been ridiculed for the couplet in his poem "England's Trust":

> Let wealth and commerce, laws and learning die,
> But leave us still our old nobility,

This is unfair. He was no believer in a caste system or class privilege. He believed on the contrary that the aristocracy should only survive if it remembered its duties as well as its rights, and he was a keen supporter of social reform, intensely loyal to Disraeli whose greatness he never ceased to admire.

See C. Whibley, *Lord John Manners and His Friends*, 2 vol. (1925).

(R. N. W. B.)

RUTLAND, the smallest county in England with an area of 152 sq.mi., lies in the east Midlands bordered by Leicestershire on the north and the west, by Lincolnshire on the northeast and east, and by Northamptonshire on the south.

Physical Features.—Generally, the surface is varied with gentle elevations and depressions running in an east-west direction as rolling upland rather than hill and dale. Most of the county is between 300 and 500 ft. above sea level, the highest land being on the western boundary with Leicestershire where heights of 600 ft. are to be found. From there the land slopes gradually eastward except where it is interrupted by the Vale of Catmose in the west and by outcropping escarpments of limestone in the east.

Topographically, Rutland can be divided into three natural areas: the Vale of Catmose, the eastern plateau, and the ridge and vale region of the south. The Vale of Catmose, which stretches northward from the west centre of the county, is bounded by the Leicestershire Hills in the west and by the oolite escarpment in the east. It is between 300 and 400 ft. above sea level and is Rutland's flattest area. The eastern plateau slopes gradually down from the east of the Vale of Catmose to the Welland Valley. From heights of 500 ft. in places it falls on the eastern side of the county to about 200 to 300 ft. above sea level. The ridge and vale region of the south is due to the alternating beds of hard and soft rocks, limestone on the ridges, and clays in the vales. The limestone ridges are spurs from the eastern plateau and have been carved by streams and rains into the present formation.

The drainage falls into three catchment areas. The small rivers, the Gwash and the Chater, rise in the Leicestershire Hills to the west and flow into the Welland which forms the southern boundary of the county with Northamptonshire. A small area in the north is drained by streams into the River Trent while the Witham takes a small stream flowing out of the county to the east.

The height above sea level, coupled with the fact that there is no natural barrier between Rutland and the North Sea, ensures a bracing climate with moderate rainfall and a reasonably good record of sunshine. The absence of heavy industry makes for clear, pure air.

The soil is of a rich red colour producing an exciting variation of flora which provide rare hunting grounds for the botanist. Because of the presence of minerals in the soil one of the major industries is the working of ironstone. The rural character of the whole of the county is of considerable landscape value, but two areas are of exceptional interest: the Eye Brook Reservoir on the southwest boundary where a number of rare birds are to be found, and Clipsham District in the northeast where there are well-wooded limestone lands. Clipsham Hall has a remarkably fine avenue of trimmed yew trees. There is a wealth of historic buildings, and the building stones of Clipsham, Ketton, and Northampton sandstone have provided materials not only for the churches and mansions and the greater part of the cottages in the villages of Rutland but also for Buckingham Palace, the rebuilt House of Commons in London, many of the Oxford and some of the Cambridge colleges.

History.—In the pre-Norman period the royal forest of Leighfield stretched from Oakham to Uppingham, and some believe that it is from the magnificent oak trees to be found there that the name of Oakham is derived. In various parts of Rutland worked flints from arable fields have been discovered, suggesting a culture of primitive hunters. Later they may have been joined by fugitives from the Saxon invaders. The Roman road, Ermine Street, crosses the county and may have had a very great influence on its early development, for excavations have revealed an important Roman settlement at Great Casterton. Finds in the Cottesmore and Market Overton districts and at North Luffenham indicate important Saxon settlements in the 5th and 6th centuries.

Rutland was given by Edward the Confessor to his queen, Edith, and the village of Edith Weston is believed to have derived its name from this gift. Though not mentioned as such at the time of the Domesday survey, Rutland was mentioned as a distinct county with a separate sheriff about the middle of the 12th century. At Oakham Castle there is one of the finest examples of late Norman domestic architecture. It is the banqueting hall of what was probably a fortified manor house and is believed to have been built in the 12th century by Walkelin de Ferrers. Many Rutland men supported the barons in their conflict with John, and a minor battle of the Wars of the Roses was fought at Empingham in 1470, resulting in a decisive royalist victory. Jeffrey Hudson, a dwarf who was served in a pie to Charles I and Queen Henrietta in the early 17th century and was subsequently knighted, and Titus Oates, who is said to have originated the Popish Plot, were both born in Oakham, while Sir Everard Digby, one of the conspirators in the Gunpowder Plot, lived at Stoke Dry.

Population and Administration.—The administrative area is 152 sq.mi. and the population (1961) 23,504. Local government is administered by the county council, one urban district council, and three rural district councils. The urban district and county town is Oakham (*q.v.*). Uppingham (*q.v.*) with nearly 1,900 and Ketton with about 1,000 population are next in size. A regular pattern of more than 50 small villages at about two-mile intervals covers the county. There is a court of assize and quarter session at Oakham, and there is one petty sessional division for the county. Rutland is joined with part of the Kesteven division of Lincolnshire for parliamentary purposes.

The Economy.—Agriculture and forestry still remain the predominant industries, though mining and quarrying are becoming basic industries due to the presence of rich deposits of iron ore extending over two-thirds of the county. Engineering is to be found at Oakham and Essendine, plastics at Oakham and Uppingham, a cement works at Ketton, and clothing factories at Oakham. Two large Royal Air Force stations and an open prison also provide employment. There are boys' public schools at Uppingham and Oakham.

The Great North Road crosses Rutland, and the Birmingham to Great Yarmouth Trunk Road traverses it from east to west.

E. Broughton (1937); J. and A. E. Stokes, *Just Rutland* (1953); W. G. Hoskins, *Rutland,* a shell guide (1963). (A. BD.)

RUTLAND, a city of Vermont, U.S., is located 95 mi. NE of Albany, N.Y.; the seat of Rutland County. In 1759 the site was an outpost on Gen. Jeffrey Amherst's military road across Vermont, connecting forts on Lake Champlain with the Connecticut Valley. Chartered in 1761 Rutland was settled by New England Yankees in 1770 and became one of the capitals of Vermont.

After 1847 railroad construction and marble quarrying attracted many Irish, French Canadian, and Italian settlers; around 1880 Rutland was Vermont's largest municipality. In 1886 three marble-producing areas (Proctor, Rutland Town, and West Rutland) seceded; since then Rutland has been second in size to Burlington.

Rutland arrivals since 1900 include Scots, Swedes, and Poles, who found work in factories making scales, castings, dresses, gloves, plywood, machinery, and airplane parts. Other economic opportunities came with Rutland's new highways, ski areas, golf courses, hospitals, hydroelectric plants, and tourist accommodations; the city is also the business centre for west-central Vermont. Modern schools, public and parochial, are augmented by a public library. For comparative population figures *see* table in VERMONT: *Population.* (J. C. HU.)

RUTLEDGE, JOHN (1739–1800), U.S. jurist and statesman who was a member of the Constitutional Convention of 1787, was born in Charleston, S.C., in September 1739. After studying law in England he returned to Charleston, where he began to practise in 1761. He was a delegate to the Stamp Act Congress in 1765 and to the Continental Congress in 1774–77 and 1782–83. He served as chairman of the committee that framed the South Carolina constitution of 1776 and as the first president or governor of the state from 1776 to 1778 and again from 1779 to 1782. In 1787 he was sent to the Constitutional Convention in Philadelphia as one of South Carolina's representatives. There he championed the cause of slavery, urged the assumption of state debts by the national government, and argued in favour of dividing society into classes as a basis for representation and requiring high property qualifications for officeholding. Having secured safeguards for slavery in the Constitution, he took a strong nationalistic position, recommending as chairman of the Committee of Detail the granting to the national government of indefinite powers of legislation for the purpose of promoting the general welfare. He was associate justice of the U.S. Supreme Court in 1789–91, and chief justice of the Supreme Court of South Carolina in 1791–95. Nominated chief justice of the U.S. Supreme Court in 1795, he failed to win confirmation by the Senate. He died in Charleston on July 18, 1800. (JN. C. M.)

His brother, EDWARD RUTLEDGE (1749–1800), a signer of the Declaration of Independence, was born in Charleston on Nov. 23, 1749. He studied law in his brother's office, and in London in 1769–73, and practised in Charleston. He served in the Continental Congress in 1774–77 and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in September 1776. As captain of artillery and as lieutenant colonel he served against the British in South Carolina. He was a member of the state legislature from 1782 to 1798, and in 1791 drafted the act that abolished primogeniture in South Carolina. From 1798 until his death on Jan. 23, 1800, he was governor of South Carolina.

RUTULI, a people of ancient Italy inhabiting Ardea (*q.v.*) and the district round it on the coast of Latium, near Aricia (*q.v.*), and just west of the territory of the Volsci. They are comparable in the form of their name with the Siculi and Appuli (Apuli), and also with the Itali, whose real Italic name would probably have been Vituli. Names with this ending are thought to belong to a fairly early stratum of the Indo-European population of Italy.

RUVO DI PUGLIA, a town and episcopal see in Bari Province, region of Apulia (Puglia), southeastern Italy, stands on the eastern slopes of the Murge, 853 ft. above sea level and 36 km. (22 mi.) W of Bari by road. Pop. (1961) 22,990 (commune). It consists of a central group of medieval buildings surrounded by a belt of modern dwellings. The 13th-century Romanesque cathedral has a richly carved main portal and a beautiful rose window; the free-standing campanile was reconstructed in the 18th century. Ruvo, then known as Rubi, was a centre of the Peucetii, an ancient Apulian tribe, and then a flourishing Greek town. At the end of the 5th century B.C. potteries there began to produce imitations of imported Corinthian and Attic black- and red-figure ware, which developed a marked local character in the 4th century. The Palazzo Jatta contains a collection of these wares. (M. T. A. N.)

RUVUMA (ROVUMA), a river rising in the Matagoro Mountains in southern Tanganyika, flows eastward into the Indian Ocean, about 20 mi. (32 km.) N of Cape Delgado. It forms the

boundary for about 400 mi. (644 km.) between Tanganyika and Mozambique (Portuguese East Africa). The total length is about 475 mi.

The basin can be divided into four major structural areas. They are, from west to east: (1) the Basement granites, gneisses, and schists; (2) a zone of Karroo sediments about 50 mi. (80 km.) wide; (3) a second zone of Basement rocks (the inselberg corridor) extending to about 39° E; (4) the Mesozoic and Tertiary sandstones and limestones of the Makonde Plateau (84 mi. [135 km.] wide). These structural areas allow the river course to be divided into three main tracts. In the upper tract, from the source to the confluence with the Messinge tributary, the river is a strong, perennial stream. The middle tract continues eastward to the west-facing scarp of the Makonde Plateau, and contains several cataracts of which the largest are the Bandara, the Sunda (with the Lisenge Narrows), and the Upinde rapids, respectively about 286, 190, and 124 mi. (460, 306, and 200 km.) from the mouth. In the third tract, the Makonde Plateau, the valley is 5 to 6 mi. (8 to 10 km.) wide, bounded by prominent sandstone scarps, and the river is divided into numerous channels by sand islands. The mouth is an estuary without permanent bar.

The chief tributaries include the great southern affluent, the Lujenda from Lake Chiuta, on the borders of Mozambique and Malawi (Nyasaland), which Livingstone thought should be called the main stream. From the Tanganyika side come the Mgunguti, Likonde, Mahesi, and Lumesule. The river has not been systematically gauged. It is perennial, but navigable for small craft only up to the Upinde Rapids. The limit of tidal flow is about 9 or 10 mi. (14 or 16 km.) from the mouth. (J. H. Wn.)

RUVUMA REGION, TANGANYIKA (Tanzania), established in May 1963 following a reorganization of administrative units in Tanganyika, comprises Songea, Mbinga, and Tunduru districts, which belonged to the former Southern Region. It is bounded northwest and north by Iringa and Morogoro regions respectively, north and east by Mtwara Region, south by Mozambique, and west by Malawi. Area 23,650 sq.mi. (61,254 sq.km.). Pop. (1963 est.) 288,000. The western boundary of the region lies along the eastern shore of Lake Nyasa in the Great Rift Valley, near which the Matengo Highlands rise to more than 7,000 ft. (2,134 m.). Originating close to Lake Nyasa, the headwaters of the Ruvuma River flow into a deep gorge along the territorial boundary in the south of Iringa Region. The Luwegu and the Mbarangano (which forms part of the northeastern boundary) are major tributaries of the Rufiji. Mean annual rainfall varies from about 35 in. in the northeast to more than 65 in. on the lake shore, where hot, humid conditions contrast with the cooler climate of the highlands. Regional headquarters is at Songea (pop. [1957] 1,401), and the population is concentrated around there, in the western highlands, and around Tunduru. The main tribal groups are the Nyasa, Matengo, Ngoni (of Zulu descent), Yao, and Makua. Cash crops include sesame, tobacco, cotton, sunflower and castor seed, cashew nuts, and some peanuts, rice, and beans. Beeswax is an important product. Large areas are infested by tsetse fly and sleeping sickness is endemic. (J. M. Ke.)

RUWENZORI RANGE, thought to be the "Mountains of the Moon" of the geographer Ptolemy. Its name probably means "the rain maker." Standing on the border of the Democratic Republic of the Congo and Uganda, this mountain range, 60 mi. (97 km.) long and with a maximum breadth of 30 mi. (48 km.), lies slightly north of the equator between Lakes Edward and Albert. It falls steeply westward to the western branch of the East African Rift Valley which is traversed by the Semliki, the western headstream of the Nile, while on the east the fall is somewhat more gradual toward the uplands of western Uganda. The range can be divided into six groups of summits on which snow lies permanently, and several lower eminences which are periodically snow-covered. There are ten peaks rising over 16,000 ft. (4,877 m.), all but one being found on Mount Stanley, which claims the highest point, Margherita Peak (16,763 ft.). The six largest mountains are separated by passes, the average elevation of which is 14,000 ft. (4,267 m.), and deeply cut river valleys with fast-flowing rivers. The entire drainage finds its way into the Semliki, either directly or via Lakes George and Edward. Many small lakes occur in the upper valleys.

The range is a gigantic uplifted horst and its origin is connected with the complex tectonics of the Rift Valley. Although the greatest upheaval appears to have taken place since Tertiary times some of the faults are Archaean in age. Unlike the other snow peaks of East Africa the range is not of volcanic origin, although a number of Pleistocene explosion craters occur on the surrounding lowlands. Composed in its outer parts of Archaean gneisses and mica schists offering no great resistance to denudation, in its centre the range consists of amphibolites, diorites, diabases, and granites, to which fact, coupled with the presence of steep dips and vertical fractures, the existence and separation of the higher summits are due.

The permanent snow line on the Uganda side stands at about 14,900 ft., but it is 1,000 ft. higher on the Congo slopes. More than 30 small glaciers have been recorded, several of which have disappeared since they were first seen in 1906. The lowest ice at present descends to slightly below 14,000 ft., although there is evidence of an earlier glaciation down to 7,000 ft. on the eastern slopes.

The range is influenced periodically by convergent moist air streams from the Atlantic and Indian oceans, so that the precipitation received is considerable. Nearly 100 in. of rainfall have been recorded at 10,000 ft. (3,048 m.) on the Uganda slopes, although there is a marked decrease with elevation above this height. The climate is excessively humid and thick cloud is a characteristic feature throughout much of the year.

The vegetation displays well-marked zones, varying with the altitude, and the following approximate upper limits of each were defined by R. B. Woosnam (1907) for the eastern slopes: grassland (6,500 ft.), forest (8,500 ft.), bamboos (10,000 ft.), tree-heaths (12,500 ft.), and lobelias and senecios (14,500 ft.), above which is the summit region of helichrysum, moss, lichen, bare rock, and snow. A characteristic of the 10,000–13,000 ft. zone is the occurrence of valley bogs, many of which are impounded by recessional moraines. The larger mammals (elephant, buffalo, etc.) ascend only to the lower fringes of the forest zone, but small buck, hyrax, serval cats, and leopards have been recorded at all heights up to the snow line. Among the birds, kites, buzzards, ravens, sunbirds, and various warblers are the most common.

The Ba'amba and Bakonjo tribes, who dwell on the Uganda slopes below 6,700 ft., are mainly cultivators of beans, sweet potatoes, and bananas, although some of them find employment as porters for climbing parties, as hunters of small game, and, more recently, as miners and artisans at the Kilembe copper mine in the eastern foothills. Power for Kilembe is obtained from a hydroelectric plant developed on the Mobuku, the largest river of the Ruwenzori.

In modern times the existence of this snow-capped mountain range was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887–89, and it was Stanley who named it Ruwenzori. Partial ascents were made by Lieut. W. Stairs, F. Stuhlmann, J. David, Sir Harry Johnston, and G. F. Scott-Elliot, J. E. S. Moore, D. Freshfield, and R. Grauer, before the British Museum expedition of 1906 when A. Wollaston and R. B. Woosnam also reached the snows. But it was the large-scale expedition led by the duke of the Abruzzi later in 1906 which conquered almost all the highest summits and produced the first adequate map of the Ruwenzori. This well-equipped expedition was responsible not only for the first detailed knowledge of the geology, topography, and glaciology but it also named the major peaks, passes, and glaciers after European royal personages and eminent explorers of central Africa. Since 1906 nearly all the remaining high peaks have been climbed and most of the valleys explored, first by N. Humphreys, and later by geologists and surveyors from Uganda and the former Belgian Congo. Scientific expeditions to the range have included the Belgian Scientific Mission of De Grunne (1930), the British Ruwenzori Expedition (1952), and a series of glaciological expeditions from Makerere University College, Uganda (1957–60), in connection with the International Geophysical Year.

RUYSBROECK (RUUSBROEC), **JAN VAN** (1293–1381), Dutch mystic of considerable influence in the 14th century, was born at Ruisbroek near Brussels in 1293. After holding the chaplaincy of Ste. Gudule, Brussels (1317–43), he became the founder of the Augustinian abbey at Groenendaal, where he wrote all his works except the first, *Vanden Rike der Ghelieven*. Ruysbroeck developed the Trinitarian system of this work in his masterpiece, *Die Chierheit der gheesteliker Brulocht*, and his other books, including *Vanden Kersten ghelove; Het Boec vanden gheesteleken Tabernacule*, an allegorical treatise on the ark or tabernacle as the meeting point of the divine and human in the world; *De Spieghel der ewigher salicheit*, which summarizes his systematic theology; and *Het Boec vanden Twaelf Beghinen*. (*Vanden Twaelf Doghedeen*, sometimes ascribed to Ruysbroeck, is almost certainly not his.) Though his considerable writings were produced for his contemporary Augustinians, in their criticism of abuse in the church they anticipate the *devotio moderna* (*see* BRETHREN OF THE COMMON LIFE; GROOTE, GERHARD) and had a widespread influence on the clergy and laity throughout the Netherlands and in France, Germany (Johann Tauler and Heinrich Suso), Italy, and Spain as late as the 16th century. With deep conviction and devotion, Ruysbroeck builds his powerful and fine prose on the mystical ethos of Hadewych (*q.v.*), developing a compendious system of teaching and belief. Although he had friends among the German mystics, Eckhart seems to have had little or no influence on him. He died at Groenendaal on Dec. 2, 1381. Ruysbroeck was beatified in 1908; his feast is celebrated on the anniversary of his death.

Colledge (1952); *Vanden Kersten ghelove*, as *The Book of the Sparkling Stone*, in *Mediaeval Netherlands Religious Literature* by E. Colledge (1965); *De Spieghel der ewigher salicheit*, as *The Book of Supreme Truth*, by Dom (1916); *Het Boec vanden Twaelf Beghinen*, as *The Book of the Twelve Béguines*, by J. Francis (1913). *See* also V. Scully, *A Mediaeval Mystic* (1910). (P. K. K.)

RUYSDAEL (RUISDAEL, RUIJSDAEL), **SALOMON VAN** (*c.* 1602–1670), Dutch painter, best known for his landscapes, was born in Naarden. He originally had the name of De Gooyer, as did his brother Izack, the father of Jacob van Ruisdael (*q.v.*). Salomon entered the Haarlem Guild of St. Luke in 1628. His first dated pictures are from 1627. He spent his whole life in Haarlem, where he was head of the guild in 1648. He belonged to the Mennonites. He died as a well-to-do person in 1670.

Salomon's early works—winter scenes—continue the tradition of Esaias van de Velde, and his early landscapes are based on the colour scheme and composition of Pieter de Molyn. In the diagonal composition of the dunes and river scenes of the 1630s he is the equal of Jan van Goyen. The colours tend to a green. Around 1645 the composition becomes more powerful, with framing motifs of great trees on one side and a distant view on the other. The colours become warmer and more transparent. In later years the light effects are more outspoken, and the decorative elements become stronger. It is probable that this change was partly caused by the influence of painters returning from Italy; *e.g.*, J. Both. In the 1660s a blue colour prevails, especially in the river scenes, which the artist loved to paint. Another favourite subject was the village inn at the roadside with cattle and herdsmen. Salomon van Ruysdael was a clever figure painter; all the small figures, which add much to the pleasant effects of his landscapes, are by his own hand. Unlike Jacob, he preferred to render actual scenery of Dutch towns, like Alkmaar, Arnhem, Dordrecht and Utrecht, but sometimes he combined motifs from different places in one picture. He also painted, especially in later years, large winter scenes, with skating on frozen rivers, of great decorative beauty.

See C. Hofstede de Groot, *Catalogue of Dutch Painters* (1912); W. Stechow, *Salomon van Ruysdael* (1938). (H. K. GR.)

RUYTER, MICHIEL ADRIAANSZOON DE (1607–1676), Dutch seaman reckoned as his country's greatest admiral, was born at Flushing on March 24, 1607. Going to sea as a boatswain's boy in 1618, he worked his way up during the next 20 years to become an independent merchant captain. In 1641 he was appointed rear admiral of a fleet sent to assist Portugal against Spain and distinguished himself in a battle off Cape St. Vincent. He resumed his activities as a merchant captain in 1642, but on the outbreak of war with England in 1652 was persuaded to accept a command in the navy. Under Adm. M. H. Tromp, he showed outstanding skill in battles off Plymouth, in the Kentish Knock and off Dungeness (1652) and in the Three Days' battle in the Channel (1653). Appointed vice-admiral of Holland in the service of the Amsterdam admiralty board in Nov. 1653, he subsequently served against French privateers and Barbary pirates in the Mediterranean. In 1659 he supported the Danes against the Swedes in the Baltic, but from 1661–64 he was again employed in the Mediterranean. In 1664–65, on secret orders from Holland, he took successful reprisals against the English on the Guinea coast, where they had seized some Dutch trading settlements, but his campaign in the West Indies, where he went immediately afterward, was on the whole a failure. On his return to the Netherlands he became lieutenant admiral of Holland and collaborated closely with the grand pensionary, Johan de Witt, in strengthening the navy. His greatest successes in the Second Anglo-Dutch War were the Four Days' battle (June 1666) and the raid on the Medway (June 1667), when he burned some of the finest English ships and carried off the flagship to Holland as a prize. Perhaps his greatest services, however, were in the Third Anglo-Dutch War, when his saving of the Dutch fleet in the Battle of Solebay (Southwold bay) in 1672 and his victories over superior forces in the battles of Schooneveld and the Texel in 1673 prevented an Anglo-French invasion of Holland by sea. In 1675 and 1676 he was fighting against the French in the Mediterranean. Wounded off Sicily on April 22, 1676, he died on April 29, at Syracuse. *See* also DUTCH WARS.

See P. J. Blok, *Michiel Adriaanszoon de Ruyter* (1928), with Eng. trans., much abridged, by G. J. Renier (1933). (E. H. K.)

RUZICKA, LEOPOLD (1887–), Swiss chemist, who was awarded the Nobel Prize for Chemistry jointly with Adolf Butenandt in 1939 for his work on polymethylenes and higher terpenes, was born on Sept. 13, 1887, at Vukovar, Yugos. He studied at the Technische Hochschule, Karlsruhe, and in 1918 became *Privatdozent* and in 1923 professor at the Eidgenössische Technische Hochschule, Zürich. He was elected to the chair of chemistry at the University of Utrecht in 1926 but returned to the Eidgenössische Technische Hochschule, Zürich, in 1929. His original work was in organic chemistry, especially in the composition of the essential oils and the higher terpenes. His investigation of civetone, which occurs in the perfume civet, showed the existence of a 17-membered ring of carbon atoms in its structure. Similar studies on ambergris showed that it was related to the substance that gives violets their perfume. Much of his success in these structural researches depended on the application of his hypothesis that the more complicated molecules were composed of aggregations of isoprene molecules or at least were built out of them. Further work led to the first laboratory production of a sex hormone, namely androsterone, and at the same time to the determination of its constitution. (D. MCK.)

RWANDA, a republic of eastern equatorial Africa bounded north by Uganda, east by Tanzania (the Kagera River forms the frontier), south by Burundi, and west and northwest by the Democratic Republic of the Congo (the frontier crosses Lake Kivu

and follows the Ruzizi River). Roughly rectangular in shape, Rwanda has an area of 10,169 sq.mi. (26,338 sq.km.). The capital is Kigali.

Physical Features.—The country lies at an altitude of more than 5,000 ft. (1,500 m.) except on the shores of Lake Kivu and along the Kagera on the Tanzanian border, where the altitude is somewhat less. The western part of Rwanda is very hilly. The Congo-Nile Divide (whose crest is covered with forests) falls steeply to Lake Kivu in the west and crosses a volcanic range in the north. The highest points of the divide exceed 9,500 ft. (2,900 m.). The rest of the country is a high plateau inclined generally eastward and entirely composed of Precambrian rocks, including granite massifs and quartzite ridges. North of Lake Kivu are lava fields dominated by the Virunga Mountains; the highest point is Volcan Karisimbi, at 14,787 ft. (4,507 m.). The barrier formed by these volcanoes blocked the flow of the rivers toward the north and led to the formation of Lake Kivu, and also of Lakes Ruhondo and Burera. Other lakes are scattered about the eastern part of the country. The most remote of the sources of the Nile lies in Rwanda.

Rwanda has a tropical climate softened by altitude. The average annual temperature at Kigali is 20° C (68° F). The shores of Lake Kivu are well known for the mildness of their climate. Rain, plentiful in the west at 47 to 51 in. (1,200 to 1,300 mm.) annually, declines toward the east to less than 40 in. (1,000 mm.) in the Kagera plain. The dry season lasts from two to three months (June, July, August). Within Rwanda are Kagera National Park and a part of Albert National Park.

People.—The population is composed of three elements: the Hutu, the Tutsi, and the Twa. The last named are very small in numbers (0.5% of the total population) and occupy the lowest rung of the social ladder, being relegated to the functions of hunters, artisans, and entertainers. The Tutsi (16.5%), very often of tall stature, formerly constituted the aristocratic class and possessed both power and wealth, notably in cattle. The Hutu (83%), Bantu agriculturalists, were bound to the Tutsi as vassals and clients; they had the task of safeguarding the herds and providing agricultural produce. There was little intermarriage between the two groups. Tutsi and Hutu speak Kirwanda (or Kinyarwanda), a Bantu language. About 50% of the Rwandans practise traditional religious beliefs; the rest are Christians, the vast majority being Roman Catholics.

The population of Rwanda in 1965 was estimated at 2,903,071 (including fewer than 5,000 Europeans and Asians). The country is the most densely populated in Africa, with more than 300 persons to the square mile. Certain western parts of the country are very heavily populated (more than 1,000 per square mile). The urban population is insignificant—about 15,000, or 0.5% of the total population. Kigali, the capital, has a population of about 5,000. The annual rate of increase in the population in the mid-1960s was 3.2%.

History.—Until its achievement of independence in July 1962 Rwanda (then known as Ruanda) had formed part of the Belgian trust territory of Ruanda-Urundi (*q.v.* for previous history). Bloody conflicts broke out in November 1961 between the Tutsi and the Hutu and continued after independence. Many Tutsi took refuge in the Congo, Burundi, and Uganda, and subsequently launched a number of raids from neighbouring countries into Rwanda. An incursion from Burundi in December 1963 was followed in early 1964 by severe reprisals (involving large-scale massacres) against Tutsi still living in Rwanda. Many Tutsi were later resettled in Uganda and Tanzania.

Administration and Social Conditions.—*Government.*—Rwanda is a republic with a president who is both head of state and head of government, assisted by a Council of Ministers. The National Assembly, elected by universal suffrage, has 47 members. Most of the seats in the assembly are held by the Parmehutu Party, which campaigned for the emancipation of the Hutu from the Tutsi. For administrative purposes Rwanda is divided into ten prefectures, which are themselves subdivided into communes.

Justice.—There is a tribunal of first instance in each prefecture, cantonal tribunals, a Court of Appeal, and a Supreme Court (comprising various sections including a Supreme Court of Appeal and a Constitutional Court).

Education and Health.—In the 1960s about 320,000 children were receiving primary education and about 3,000 secondary education. A university, still incomplete, was established at Butare in 1963; its courses include medicine, the social sciences, and teacher training. Butare also has institutions providing training in husbandry, medicine, and veterinary medicine. More than one-fifth of the national budget is devoted to education.

Malaria is endemic in certain parts of the country, and pulmonary diseases are common. There is a shortage of doctors (1 to 55,000 inhabitants).

The Economy.—The economy of Rwanda is essentially subsistence agriculture, the main crops being sorghum, beans, peas, sweet potatoes, corn (maize), cassava, and bananas. The main cash crop is coffee, of which 8,000 tons were exported in 1964. Some tea and pyrethrum are also exported. Rwanda has considerable stock of cattle (about 500,000 head in the 1960s) whose social value is greater than their value as a source of food. There were also about 250,000 sheep, 1,000,000 goats, and 60,000 pigs.

Mineral production accounts for just under 40% of exports by value: cassiterite, wolfram, beryllium, columbium-tantalite, amblygonite, and some gold. Lake Kivu has a little methane, exploitation of which has begun near Gisenyi. The only industry consists of small factories for the processing of agricultural products (a brewery, soap works, etc.). Industrial expansion is hindered by the country's remoteness from the sea. Rwanda has three hydroelectric stations, including one on the Ruzizi River. Installed capacity is 21,440 kw., but only one-third is being used. In the mid-1960s the annual value of exports amounted to about 580,000,000 Rwanda francs (officially at par with the Belgian franc) and imports to 600,000,000 RFr. There are no railways, but Rwanda has a fairly dense network of dirt roads, which link it with the Congo, Burundi, and Uganda (the chief route for the export of agricultural products). There is a weekly air service between Kigali airport and Brussels. Small airfields serve the interior of the country. Kigali Radio broadcasts in French and Kirwanda, and also in English and Swahili.

(HE. NI.)

RYAZAN, PRINCES OF. Ryazan, with its capital city the old Ryazan on the Oka River about 150 mi. (241 km.) SE of Moscow, became an independent principality early in the 12th century under Yaroslav, son of Grand Prince Svyatoslav Yaroslavich of Kiev. The history of the principality and its princes for 100 years was one of internecine strife and conflict with the princes of Vladimir. But by 1237, when the Mongol-Tatar army under Batu Khan attacked and sacked the capital, stability had been restored and the territory of the principality had been enlarged under Grand Prince Yuri Igorevich. After the sack of old Ryazan economic and political life centred around Pereyaslavl-Ryazanski (modern Ryazan is about 30 mi. [48 km.] upstream from old Ryazan) and Pronsk, and for a century the princes frittered away their strength in the struggle for supremacy between the two centres. In the reign of Ivan I Kalita, grand prince of Vladimir and Moscow from 1331 to 1341, Ryazan was relatively weak; but under Oleg Ivanovich (1351–1402), who dared to resist Moscow, the fortunes of Ryazan revived, and, with the support of the Golden Horde, the principality acquired a measure of independence and even temporarily extended its frontiers.

The struggle with Moscow continued, to Ryazan's detriment. Fedor Olgovich (reigned 1402–27) was too weak to resist and was obliged to recognize his dependence on Moscow. Ivan Fedorovich (1427–56) acknowledged the suzerainty of Vytautas of Lithuania in 1427, but after Vytautas' death (1430) he only recognized whoever held the throne of Moscow. By the treaty of 1447 with Vasili II he agreed to hold the grand prince of Moscow as his "elder brother" and renounce all independent foreign relations. At his

death his eight-year-old son Vasili Ivanovich (1456–83) was entrusted to the care of Vasili II, who sent his governors to rule Ryazan. Vasili Ivanovich, however, having married Grand Prince Ivan III's sister, was allowed to rule Ryazan from 1464, though in complete subordination to Moscow. His son Ivan (1483–1500) was equally submissive. In 1521, when Ivan Ivanovich, last of the princes of Ryazan, having entered into secret negotiations with the Tatars, was arrested by Grand Prince Vasili III, Ryazan was formally annexed by Moscow.

See D. I. Ilovaiski, *Istoria Ryazanskogo Knyazhestva* (1858). (J. L. I. F.)

RYAZAN, an *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., was established in 1937. Area 15,290 sq.mi. (39,601 sq.km.). Pop. (1959) 1,444,755. The larger, northern part lies in the middle Oka basin. That part of the *oblast* north of the Oka forms an extensive swampy depression, known as Meshchera, thinly populated and largely forested, where some reclamation has been carried out from the late 19th century on. The broad plain of the Oka right bank is drained by its tributaries, the Pronya and Para. In the south the *oblast* falls within the basin of the upper Don. The rolling hills of the central Russian upland, greatly cut up by both river valleys and erosion gullies, occupy the southwest, dropping to the plain of the Oka-Don lowland in the southeast. All the Oka basin lies in the mixed forest zone, with a natural cover of oak, spruce, pine, and birch forest. A high proportion of the forest (except in Meshchera) has been cleared for agriculture. In the south the *oblast* passes into the forest-steppe zone with patches of open grassland, also largely plowed, on gray forest soils or degraded chernozems. The Meshchera swamps are mostly reed or grass marsh, although peat bogs are occasionally found.

A small proportion (30%) of the 1959 population was urban. Of these, almost half lived in the one sizable town, Ryazan (*q.v.*). The other 8 towns and 26 urban districts are small, local centres, chiefly concerned with processing agricultural products and timber working. Near Skopin a little lignite is mined. Agriculture is mainly concerned with rye, oats, and spring wheat. Vegetables are important along the Oka, while the main industrial crops are flax and hemp in the north and sugar beets and tobacco in the south. (R. A. F.)

RYAZAN, a town and *oblast* centre of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the right bank of the Oka River, 196 km. (122 mi.) SE of Moscow. Pop. (1959) 214,130. Present-day Ryazan stands on the site of the ancient Russian town of Pereyaslavl-Ryazanski, but the original Ryazan, now known as Staraya (Old) Ryazan, lay farther downstream at the Pronya confluence. Staraya Ryazan, first recorded in 1096, was the seat of the early princedom, with a kremlin (citadel) and two 12th-century cathedrals. Its princes waged a constant and bitter struggle with those of Vladimir. The town was the first to meet the Tatar invasion and was utterly destroyed in 1237. Although it was later reestablished Ryazan lost all importance and today only the ruins of the ramparts remain.

Pereyaslavl-Ryazanski is believed to have been founded in 1095 by Yaroslav Svyatoslavich, although some sources give a later date. It was unimportant until the later 13th century when the Ryazan bishopric was moved there. It was sacked by the Muscovites in 1371 and by the Tatars in 1372 and 1378, when it was completely laid waste. In the 15th century it became the centre of the Ryazan princedom, but in 1521 Ryazan passed under the rule of Moscow. Thereafter it served as a key fortress on the approaches to Moscow and the eastern anchor of the Tula defensive line. In 1778 its name was changed to Ryazan. The 18th and 19th centuries brought considerable importance to the town as a focus of the grain trade to Moscow. Modern Ryazan has large engineering industries, making agricultural machinery, electric lamps, radios, calculating machines, and machine tools. Oil refining is fast developing. It is still a major route centre; the Oka is navigable and there are railways to Moscow, Vladimir, Kuibyshev, and Voronezh. (R. A. F.)

RYBINSK (formerly SHCHERBAKOV), a town in Yaroslavl *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the Volga near its most northerly point, 50 mi. (80 km.) NW of Yaroslavl. Pop. (1959) 181,685. The place developed in the 14th–15th centuries as Rybnaya Sloboda ("the fishing settlement") and became the town of Rybinsk in the 1770s. After the Revolution it was renamed Shcherbakov, until 1957. Its trade grew with the opening of the Mariinsk Waterway from the Volga to Leningrad (St. Petersburg) and it is now an important river port. There is a large engineering industry, producing printing machinery, cranes, road-making machinery, river tugs, dredgers, and timber-working equipment. Other products are roofing and insulating materials, ropes, matches, leather goods and foodstuffs. Rybinsk is linked by rail with Yaroslavl and Bologoye (on the Moscow–Leningrad line) and by road with Vologda, Uglich, and Yaroslavl (and thence with Moscow).

In 1941 a large barrage and hydroelectric station was completed on the Volga, immediately above Rybinsk, to form the Rybinsk Reservoir. It created what was then the largest man-made lake in the world, covering about 1,757 sq.mi. (4,550 sq.km.). This area makes it the fourth largest lake in Europe. The power station has a capacity of 330,000 kw. (R. A. F.)

RYBNIK, a town in southern Poland in the Katowice *wojewodztwo* (province). Pop. (1960) 34,099. It lies in the sub-Carpathian Valley, on the Nacyna River (a secondary tributary of the Oder), and near extensive woods. In 1282 it became the capital of the Racibórz principality under a member of the Polish Piast dynasty. In 1327 it was given in pledge to Bohemia. Like Bohemia itself Rybnik passed into the hands of the Habsburgs in the 16th century. It became part of Prussia when Frederick the Great conquered Silesia in 1742. When Upper Silesia was partitioned in 1921 between Poland and Germany, the town and district returned to Poland.

Exploitation of the mineral resources of the district started in the Middle Ages (iron foundries, rolling mills), and from the 19th century, coal mining made the town a major industrial area of the province. It also produces metal tools. (K. M. Wr.)

RYDBERG, (ABRAHAM) VIKTOR (1828–1895), Swedish author, whose wide range of activities enabled him to exercise great influence on Swedish cultural life, was born at Jönköping on Dec. 18, 1828. His mother died in a cholera epidemic, his father became a dipsomaniac, and he grew up among strangers, with no home of his own. He matriculated at Lund but had to break off his studies for lack of money. In 1855 he found employment with the liberal newspaper *Göteborgs handelstidning*, in which *Den siste atenaren*, the novel which made his name, appeared serially in 1859. Its description of the clash between paganism and Christianity in ancient Athens, showing a bias against clerical intolerance and orthodoxy, had a direct bearing on conditions in Sweden. He had previously published *Singoalla* (1857; revised 1865), a romantic lyrical tale of the middle ages in Sweden. His *Bibelns lära om Kristus* (1862), in which he maintained that, according to the Bible, Christ was not God, did much to further a liberal outlook in theology and the church.

In the 1870s Rydberg engaged in many new activities. He entered the *riksdag* for a short time. He advocated linguistic reform, being particularly anxious to reduce the number of words borrowed from the German. In 1874 he visited Rome and on his return wrote *Romerska dagar* (1877), in which his interest in classical antiquity finds its most mature expression. In 1876 he completed his translation of part i of Goethe's *Faust*, which had occupied him for many years. During these years also he revealed outstanding talent as a poet: his collection *Dikter* (1882) established him as the foremost lyrical poet since Esaias Tegnér and Erik Stagnelius. He gradually gained official recognition and was given an honorary doctorate by Uppsala university in 1877, elected to the Swedish Academy in 1878 and in 1884 called to the chair of cultural history at the Stockholm *högskola*, this professorship being subsequently changed to one in the theory and history of art. In the 1880s he was chiefly concerned with research into mythology, the results of which were published in the learned and imaginative *Undersökningar i germanisk mytologi*, 2 vol. (1886–89). In 1891 he published two late flowerings of his literary genius: *Vapensmeden*, a novel describing life at the time of the

Reformation in Sweden, and a new collection of poems, one of which, "Den nya Grottesången," is a remarkable indictment of existing social conditions.

Rydberg was an idealist, faithful to the romantic tradition in poetry and thought but with a mind receptive to the ideas of a new age. He achieved an unequaled position of authority in Swedish culture. He died at Djursholm on Sept. 21, 1895. His *Samlade Skrifter* were edited by K. Warburg, 14 vol. (1896–99).

RYDE, a municipal borough and seaside resort in the Isle of Wight, Eng., 4½ mi. SW of Portsmouth across the Solent. Area 12.3 sq.mi. (31.9 sq.km.). Pop. (1961) 19,845. On rising ground on the northeast coast, overlooking Spithead, Ryde has woods reaching to the water's edge, and miles of golden sands. It is built on the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. At the close of the 18th century it was a small fishing hamlet, but it rapidly grew as a holiday place, and catering for tourists became its chief industry, with agriculture second in importance. The ancient Ryde Carnival is held annually in September. The town was incorporated in 1868. Ryde is connected by boat with Portsmouth. The principal buildings are All Saints Church, the market house and town hall, the Royal Victoria Yacht Club, the pavilion, the Royal Isle of Wight Infirmary, and the Commodore Theatre.

RYDER, ALBERT PINKHAM (1847–1917), U.S. painter, noted for his lunar landscapes and allegorical scenes, was born at New Bedford, Mass., March 19, 1847. About 1868 the family settled in New York City, where Ryder briefly studied painting. He first exhibited at the National Academy of Design in 1873, but most of his exhibited work was shown at the Society of American Artists, of which he was a founding member. In 1882 he traveled in Europe, but paintings in the art galleries interested him little. He was an imaginative, solitary painter; his lifework of about 150 pictures was produced slowly.

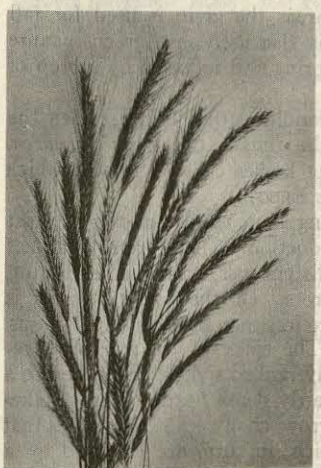
By 1900 his powers were impaired, and he injured some earlier paintings with misjudged reworkings; thus he unconsciously prepared the way for the many forged examples that appeared. After a critical illness, friends took him to their home in Elmhurst, Long Island, N.Y., where he died March 28, 1917. Major works include "Siegfried," "The Race Track," and "Toilers of the Sea." Extraordinary colourfulness triumphs over technical imperfections, and his themes range from an idyllic pastoralism through intensifying romanticism to an epic splendour. Many of Ryder's paintings have suffered rapid deterioration.

See Frederic Fairchild Sherman, *Albert Pinkham Ryder* (1920); L. Goodrich, *Albert Pinkham Ryder* (1947). (VL. B.; X.)

RYE, a municipal borough and market town in the Rye parliamentary division of East Sussex, Eng., 11 mi. N.E. from Hastings by road. Pop. (1961) 4,438. Area 1.2 sq.mi. (3.1 sq.km.). Rye is a picturesque market town, built up a hill by the Rother river, with cobbled streets and timber-framed and Georgian houses. Ypres tower (12th century), which stands on the cliff, was its only defense until Edward III walled the town, but Landgate (1329), one of the three original entrance gates, is all that remains of the 14th century fortifications. The Norman to Perpendicular church of St. Mary has a notable quarter-boy 16th-century clock, and in the churchyard is a Georgian reservoir. Other interesting buildings are the old grammar school (1636), the town hall (1742), the old hospital, the Mermaid inn (*c.* 1420) and the Flushing inn, which contains a mural dated 1547.

As part of the manor of Rameslie, Rye was granted by Edward the Confessor to the monks of Fécamp, by whom it was retained until resumed by Henry III in 1247. The town became a full member of the Cinque Ports *c.* 1350 when, with Winchelsea, the other ancient town, it was added to the confederation. It was then a flourishing port but declined in the late 14th century, partly recovered its prosperity with the decay of Winchelsea in the 15th and 16th centuries and then sank again when the sedimentation and consequent receding of the sea, which had been going on slowly since the 14th century, made the use of the harbour impracticable. By the mid-20th century the Rother's mouth was 2 mi. from the town. Rye was twice burned down by the French, in 1377 and 1448. The town was incorporated in 1289 and was granted a three days' fair. Twice-weekly markets had been held before 1405 when the Friday market was changed to Saturday. The market now serves a wide agricultural area. Industries include light engineering, dry cleaning and the tourist trade.

RYE. A cereal grass, rye is grown for use in making rye bread and rye whisky and for livestock feed. The cultivated types of rye, known botanically as *Secale cereale*, are grown extensively in Europe, Asia and North America. As one of the less important of the cereal crops, rye generally is grown for grain only where the environmental conditions are relatively unfavourable for other cereals. Rye probably originated in southwestern Asia, like several other important cereals, such as wheat, oats and barley, with westward migration across the Balkan peninsula and over Europe (*see* AGRICULTURE). No trace of cultivated rye has been found in early Egyptian monuments; likewise no reference to this crop is found in ancient writings. However, the name occurs in northern European languages, suggesting early cultivation in this area.



J. HORACE MCFARLAND CO.

RYE (SECALE CEREALE)

Only one species of cultivated rye is recognized, *Secale cereale*, although several other species have been found growing wild; there are annual and perennial species and many varieties of weedy plants are closely related to the cultivated species. Rye has 14 somatic chromosomes, and there is no evidence of a polyploid series except for artificially produced tetraploids with 28 chromosomes. Most rye is grown as a fall-sown annual, though a little is spring sown with spring instead of winter varieties.

The greatest production of rye occurs in the temperate and cool regions of the world; it grows also where altitudes are high. It has the greatest winter hardiness of all small grains, and its culture extends to the more northerly parts of North America and as far north as the Arctic circle of Europe and Asia. The type of soil has an important influence on geographic distribution. Rye is frequently grown where other crops fail because of low fertility. Most production is from the poorer soils of Europe and the U.S.S.R. and the sandier and poorer soils of North America where it is too cool for winter wheat. Soil requirements are modest—even more so than for oats. Rye will produce well on fertile soil, such as the chernozem (black earth) of eastern Europe, but this type of soil is reserved for growing other crops.

Cultivation and Uses.—Rye is grown much the same as other cereal crops. Usually it is planted with a grain drill at a rate of five to six pecks per acre, depending upon the size of seed. It is not used generally as a companion crop in establishing forages as is common with wheat and oats. Usually it is rotated with other crops, taking the place of winter wheat. Where it is used for pasture, it serves largely as an emergency crop. Seedings are made in the fall, and the crop matures somewhat earlier than the other small grain crops such as wheat, oats and barley. Harvesting in the northern areas comes in late June and early July.

The principal uses of rye are as flour for bread, as feed for livestock and as a pasture plant. Of the cereals, only wheat and rye have the qualities necessary for making a loaf of bread from the flour. The rye flour, however, is very inferior to wheat for baking, lacking the elasticity so essential to a good loaf and being heavy and dark in colour. In Eurasia a loaf made from pure

rye flour commonly is referred to as black bread because of its colour. Relatively little rye flour is used for breadmaking in the United States; when so used, it is commonly blended in varying proportions with wheat flour.

Livestock feed is one of the main uses of the rye crop. For most classes of livestock it is usually fed in a mixture. It has less fats than has wheat, about the same protein content and compares favourably with wheat and corn for carbohydrates. Vitamin B_1 content is slightly lower than in barley and wheat and much lower than in oats. Rye is used also in the making of alcoholic beverages (*see* WHISKY).

Rye straw is fibrous and tough and used less for feed than for litter or bedding. It is used for mattresses and thatching in certain areas of the world, and in the manufacture of hats and paper.

Rye has considerable use for fall and spring cattle grazing. As a spring pasture it is available before permanent pastures have made sufficient growth for livestock use. The leaves are high in vitamin A content. In warmer areas the grain is used for fall grazing and cover cropping. It is also used as a green manure crop, being plowed under in the spring and followed by a crop of greater economic value.

Diseases.—Ergot is a disease condition that follows when the young kernel is penetrated by the fungus *Claviceps purpurea*. This results in purplish-black ergot bodies called sclerotia, which contain several alkaloid drugs (*see* ERGOT).

Although other diseases, including snow mold, attack rye, most of them cause only minor yield reduction. There are several leaf and stem diseases, such as leaf and stem rust, stalk and head smut, scald and blotch, and some root rots. On the whole, if ergot is discounted, disease losses in rye are less than in other small grains.

Botanical Characteristics.—The spike of the rye plant resembles wheat in having alternately ranked spikelets attached to a zigzag axis or rachis, forming a fairly dense head or ear. Spikelets are composed of two thin, narrow, chaffy scales or glumes that subtend two or more florets, which, in turn, are enclosed by a lemma and palea (*see* GRASSES: *Structure*). The lemmas taper into slender bristles or awns that are about two to four centimetres long. Each floret contains three stamens and a pistil, which, after pollination, develop into a one-seeded fruit that is partly exposed. The threshed seed or fruit is known as a caryopsis, a term applied generally to the fruits of cereal crops. Grain colour varies, but grayish-green and light brown predominate, while some are almost white. The thin shell or pericarp sometimes ruptures over the germ. Sterile florets occur to the extent of 25% to 30%, thereby reducing production. Cross-pollination occurs almost completely because the flowers are largely self-sterile. The first foliage leaf is reddish or purplish tinged. Other leaves are long, narrow and thin with a short ligule and a moderate-sized auricle at the juncture of the blade and sheath. The leaf sheaths have a bluish-green bloom. The height and number of the jointed stems or culms depend upon growth conditions.

Rye has the tallest and strongest straw of all of the small grain crops. The straw may attain a height of seven to eight feet on fertile soils but is usually five feet or less. Improved varieties generally have straw of a length more suitable for the use of harvesting equipment. There are numerous fibrous roots, and they penetrate more deeply than do those of other small grains.

Breeding and Hybridization.—Improvement of the rye plant by breeding is difficult because of the high degree of self-sterility. Most improvement has been accomplished by mass selection rather than by the pure line method of breeding. Varieties are genetically impure because of cross-pollination. Moderately self-fertile inbred lines can be perpetuated without difficulty. Hybrid vigour with greater productivity than open-pollinated varieties results when selected inbred lines are properly mated. No method has been found to utilize this biologic principle commercially. Since rye is thrifty and winter hardy it has been hybridized with wheat, resulting in winter-hardy selections with the appearance and quality of wheat. However, commercial production of varieties from wheat-rye hybrid origin is rather small. Hybrids with other genera have been made.

During the 1940s tetraploids (28 somatic chromosomes) in rye were produced by several scientists. One tetraploid called Tetra Petkus gained some prominence in the early 1950s; it is stiff strawed, leafy and late in maturity. Kernels are large, weighing 1½ to 2 times as much as common rye. Tests indicate Tetra Petkus flour will bake satisfactorily. Reduced yield may result if the tetraploids are sown close to the common varieties, because cross-pollinated flowers do not produce seed.

In North America the following varieties of common rye are used commercially: Dakold, Emerald, Pierre, Imperial, Caribou, Rosen, Balbo and Abruzzi. The Balbo variety is especially valuable as a pasture crop. Tetra Petkus has proved excellent for pasture in some sections. Most of these varieties have come from stocks of European and Russian origin.

In other countries some important varieties are: Petkus, Kings II, Steel, Star, Ensi, Toivo, Borris Pearl and Vjatka.

Production and Trade.—The estimated world production of rye in the 1960s was about 1,350,000,000 bu. a year. Of this total, approximately 45% was produced in the U.S.S.R. The United States and Canada produced approximately 1.5% of the world total. The leading rye-producing countries in order of importance were the U.S.S.R., Poland and West Germany. Other important producing countries are Argentina, Turkey, the United States, Spain, Hungary, France, the Netherlands, Austria and Denmark. The average acre yield in the United States is about 20 bu. The leading rye-producing states are North Dakota, South Dakota, Nebraska, Minnesota and Wisconsin.

Trade in rye has been more limited than that in other grains. Seasonal production influences trade between countries. The U.S.S.R., Canada, Turkey and Argentina usually export rye, while Germany, Finland, Austria and Norway import much more than they export. The United States has been a large exporter but was importing modest quantities in the 1950s and 1960s.

RYKOV, ALEKSEI IVANOVICH (1881–1938), Russian Communist leader who at different times opposed both Lenin and Stalin, was born at Saratov on Feb. 25 (new style; 13, old style), 1881, the son of a peasant. At 18 he joined the Russian Social-Democratic Workers' Party (RSDWP), visited Lenin in Geneva in 1902, and returned to Russia to work as a revolutionary. He was many times arrested and deported, but each time escaped. In 1904, after Lenin's break with the predominantly Bolshevik official party leadership, Rykov assisted him in forming the subfaction of "stone-hard" Bolsheviks and was a member of its bureau. He attended the third party congress of the RSDWP (London, 1905) and was elected to its central committee. He took part in the 1905 revolution, and was again in London, as a delegate to the fifth congress, in 1907. After 1907 Rykov took up a conciliatory attitude toward non-Leninist factions in the party, and in 1910 became one of the "party-minded Bolsheviks" (a group consisting of such conciliators). He lived in Paris during 1910–11, returned to Russia, and in 1913 was banished to Siberia; he escaped in 1915 but was recaptured and remained in banishment until the revolution of March 1917. He opposed Lenin's idea of a unilateral seizure of power by the Bolsheviks and advocated a coalition government of all Socialist parties.

Rykov took an active part in the November revolution, and became people's commissar of the interior in the first Bolshevik government headed by Lenin. He was chairman (1918–21) of the Supreme Council of National Economy, and deputy chairman (1921–24) of the Council of Labour and Defense and of the Council of People's Commissars, succeeding Lenin as chairman of the latter in 1924. A member of the Politburo from 1923, Rykov sided with Stalin against Trotski, but during 1928–29 was a leader of the "Right Opposition" against Stalin. The defeat of the "Right Opposition" led to Rykov being replaced (1930) by V. M. Molotov as chairman of the Council of People's Commissars. He became people's commissar for communications in 1931 but was dismissed in 1936 and expelled from the Communist Party for his alleged "treacherous anti-party activity" in 1937. In 1938 he was, together with N. I. Bukharin, principal defendant in a great show

"trial." Sentenced to death on March 13, he was shot next day. (L. B. Sc.)

RYMER, THOMAS (1643?–1713), English critic who introduced to England the principles of French formalist, neo-classical criticism and who also, as historiographer royal, compiled a famous collection of treaties (the *Foedera*), was born, probably in 1643, at Yafforth Hall, near Northallerton, Yorkshire. He was the younger son of Ralph Rymer, a zealous Roundhead who in 1656 became lord of the manor of Brafferton, Yorkshire, and who was executed in 1664 for complicity in the abortive insurrection at Farnley Wood, near Leeds (October 1663), which aimed to restore the Long Parliament. Thomas, however, was educated at Northallerton Free School, under Thomas Smelt, a noted Royalist. He was admitted to Sidney Sussex College, Cambridge, in 1659, but left without taking a degree, and, having become a member of Gray's Inn in 1666, was called to the bar in 1673. He then turned his attention to literature, and in 1674 produced a translation of René Rapin's recent *Réflexions sur la poétique d'Aristote,* which made known to English readers the rational, neo-classical critical principles then current in France. This was followed in 1677 by *The Tragedies of the Last Age,* an epistle in which he "consider'd and examin'd" (and severely criticized) plays by Beaumont and Fletcher, and Milton's *Paradise Lost,* in the light of classical practice and rational principle. In the same year he wrote *Edgar, or the English Monarch,* a "heroick tragedy" in appalling verse, never performed, but published in 1678, of which Sir Sidney Lee, in his article on Rymer for the *Dictionary of National Biography,* rightly said that "the only service [it] rendered to art was to show how a play might faithfully observe all the classical laws without betraying any dramatic quality." His rendering into English of the "Life of Nicias" was included in the collection of translations of Plutarch's *Lives* (1683–86), for which Dryden wrote a life of Plutarch, and in 1693 he published *A Short View of Tragedy,* which contains his notorious attack upon Shakespeare's *Othello* ("a Bloody farce, without salt or savour").

Rymer's critical principles were inherited from the French formalist critics, especially from Jules de la Mesnardière's *Poétique* (1640), from the abbé d'Aubignac's *La Pratique du théâtre* (1657), and from Rapin. Invoking "the practice of the Ancients" and "the Common Sense of all Ages" as his criteria, he insists that dramatic action should be probable and reasonable, that it should instruct by moral precept and example (it was he who coined the term "poetical justice") and that characters should behave either as idealized types or as average representatives of their class. In the *Short View,* in which his neo-classicism is at its narrowest, he rejects all modern drama and recommends a return to Aeschylus. This work provoked many indignant replies, notably from John Dennis (*q.v.*), and from the essayist and critic Charles Gildon who, however, later himself became quite as rigid a formalist as Rymer. That Rymer's criticism stimulated Dryden, the greatest critic of the century, to reformulate his own theories about drama, is clear from Dryden's notes on *The Tragedies of the Last Age,* first published in Jacob Tonson's 1711 edition of Beaumont and Fletcher.

Pope called Rymer "a learned and strict critic," and although he was ridiculed in the 19th century—Macaulay thought him "the worst critic that ever lived"—he did realize, as did few of his contemporaries, that admiration for Elizabethan and Jacobean drama was incompatible with reverence for the classical "rules," and he was, moreover, the first critic to examine a Shakespeare play (*Othello*) systematically. His chief faults were lack of taste and inability to appreciate purely imaginative writing.

Rymer's interest in history, as well as his adherence to the Whigs, is attested by his *General Draught and Prospect of Government in Europe* (1681), a tract which argues, partly from medieval chronicles, the rights of parliaments against royal prerogative. In 1692 he succeeded Thomas Shadwell as historiographer royal, at a salary of £200 a year, and in 1693, when William III's government, probably at the suggestion of Lord Somers and Charles Montague (later earl of Halifax), decided to publish for the first time copies of all past treaties entered into by England, Rymer was appointed editor and granted access to all necessary documents. He worked with great determination, taking as his model Leibniz' *Codex juris gentium diplomaticus* (1693), and corresponding with Leibniz, who influenced him considerably, from 1694 onward. He made use, also, of an Elizabethan manuscript catalogue of treaties compiled between 1570 and 1610 by Arthur Agarde. Unfortunately, he exposed himself to the shafts of Scottish antiquaries, when he ordered, perhaps unwittingly, an ancient forgery from the Chapter House collection, which purported to be a charter of King Malcolm, acknowledging Edward the Confessor's overlordship, to be engraved in facsimile. Rymer later denied that he ever intended to publish this copy. In the ten years he spent collecting materials, he received no remuneration from the treasury for his editorial work, and was forced to cover all expenses from his own resources. By 1698, he had expended £1,253 on the project, engravers and amanuenses alone costing him £240 a year. Many petitions were needed, supported by Montague's influence, before the government would set aside money for printing the work. Eventually the first volume of the *Foedera conventiones literae et cujuscunque generis acta publica, inter reges Angliae, et alios quosvis imperatores, reges, etc.,* which covered the years 1101–1273, was published in 1704. One or more volumes appeared annually until 1713, the year of Rymer's death, when the 15th volume, containing documents dated from 1543 to 1586, was produced. Robert Sanderson, who had been appointed Rymer's assistant in 1707, succeeded him as editor, and published the 16th volume, compiled from Rymer's papers, in 1715, and the 17th, in which the last treaty is dated 1625, in 1717. Sanderson also published three supplemental volumes in 1726, 1732, and 1735, bringing the total to 20. In spite of numerous omissions, occasional errors of dating, inaccurate transcriptions, and the inclusion of many items, without acknowledgment, from printed, not manuscript, sources, and of many not properly either *foedera* or *acta publica,* Rymer's work remains of considerable value to the student of medieval and 16th-century history.

Rymer died in London, on Dec. 14, 1713.

BIBLIOGRAPHY.—The *Syllabus* of the *Foedera,* ed. by Sir T. D. Hardy, 3 vol. (1869–85), provides a good account of Rymer's life and historical work in the prefaces to vol. i and ii. This is corrected and implemented in the introduction to C. A. Zimansky's edition of *The Critical Works of Thomas Rymer* (1956), which includes a full bibliography. For an estimate of Rymer's achievement as editor of the *Foedera, see* D. Douglas, *English Scholars,* 2nd rev. ed. (1951). *See* also G. B. Dutton, "The French Aristotelian Formalists and Thomas Rymer," in *Publications of the Modern Language Association of America,* vol. xxix, pp. 152–188 (1914). (Jo. C.)

RYSBRACK, JOHN MICHAEL (1694–1770), one of the principal sculptors and designers in England in the 18th century, was born at Antwerp in 1694 and studied there, probably in the workshop of Michael van de Voort. He was also influenced by the sculpture of F. Duquesnoy. He worked in Copenhagen, Paris, and Rome and in 1720 established himself in London, where, except for another journey to France and Italy, he lived until his death on Jan. 8, 1770.

Rysbrack worked in a classical, sometimes eclectic manner, avoiding emphatic gestures, exaggerated asymmetry, and extremes of illusionism. His work includes 16 monuments in Westminster Abbey, the splendid equestrian statue of William III at Bristol, tombs in parish churches all over England and innumerable portrait busts. In some respects Rysbrack outshone L. F. Roubillac, his only rival for preeminence in England at that time. Pyramidal composition and judicious choice of material are characteristic features of Rysbrack's funeral sculpture.

See M. Batten, *Michael Rysbrack, Sculptor* (1954). (J. A. DR.)

RYSWICK: *see* RIJSWIJK.

RYUKYU ISLANDS (NANSEI-SHOTŌ), a chain of islands and islets extending almost 400 mi. (644 km.) NE-SW from southern Japan to the northern tip of Formosa. The land area of the chain is 848 sq.mi. (2,196 sq.km.), and the population in 1960 was 883,122. The largest and by far the most populous of the islands is Okinawa, which became well known as the site of a fierce battle between U.S. and Japanese forces during World War II. The capital and the largest city is Naha on Okinawa with a population in 1960 of 223,047.

The Ryukyus consist of three major groups: the Amami-guntō

in the north, the Okinawa islands in the central area, and the Sakishima islands to the south. The larger islands are generally volcanic in origin and have mountainous terrain; most of the smaller islands were formed by coral and are relatively flat. The climate is semitropical with a mean annual temperature of 70° F (21.1° C). About 12 to 45 typhoons occur annually, affecting all aspects of life. Major types of plant life include Japanese cedars and pines on the northern islands, and camphor, banyan, and banana trees in the south. Snakes, wild boars, deer, and black rabbits are found on some of the Ryukyus. (X.)

The people of the islands seem to be a result of prehistoric southward migrations from Japan mixed with northward migrations from southeast Asia. They most closely resemble the Japanese in physical type. Similarly, the Ryukyuan language (with its various dialects) is classified with Japanese, although there is no mutual intelligibility. This suggests that the peoples of the islands may be linked historically with those of Japan despite the absence of political unity in the past.

Culturally, the Ryukyuans are subjected to influences emanating from both Japan and China. The islands are primarily rural. with the local farming village providing a basic pattern of life. As in China and Japan, social emphasis lies in kinship, the Ryukyuans having developed the common descent group with its stress on ancestral relationships and consanguinity. This, in turn, may cut across settlement or village lines. Religion relates to kinship, revolving around an ancestral cult with elaborated mortuary observances and tombs. The Ryukyuan family system is somewhat more extended than the Japanese. This and the funerary rituals, indicate south Chinese influence, but the association of Buddhism with an ancestral cult suggests Japanese practice. (R. F. Sr.)

In ancient times the Ryukyus formed an independent kingdom. How early China exerted influence is not known, but a major invasion occurred in the 7th century A.D. Chinese supremacy was established by the late 1300s and for the next five centuries the Ryukyuans paid tribute to China. Contacts with Japan probably began in the 8th century A.D. Japan invaded the Ryukyus in 1607 and joined China in exacting tribute from the islanders. In 1872 the Ryukyuan king became one of Japan's feudal lords, establishing complete Japanese supremacy. With the abolition of feudalism in 1879, the Ryukyus became Okinawa Prefecture.

After the defeat of Japan in World War II, the U.S. took control of the islands. Okinawa was occupied by U.S. military forces and became an important American base. The military government was replaced in 1951 by a U.S. civil administration, headed by a high commissioner. In 1953 the Amami-guntō group was returned to Japan. The islands are locally governed under the auspices of the U.S. administration. The government consists of an executive, a legislative, and a judicial branch. Until 1966 the chief executive was appointed by the U.S. high commissioner after consultation with the 29-member elected legislature. In that year, however, a higher measure of self-government was instituted, and the chief executive was elected by the legislature.

Agriculture is the dominant occupation of the islands, with sweet potatoes and rice the staple foods. Black sugar and canned pineapples are among the leading exports. Traditional industries include lacquer and pottery, while newer enterprises manufacture whale products, industrial compounds, and refined sulfur. U.S. armed forces provide considerable revenue on Okinawa.

Because of high birth rates and declining death rates, a large proportion of the population attends school, and generally about one-third of the annual budget is applied to education. The University of the Ryukyus, established in 1950, annually enrolls more than 2,000 students. (R. B. H.; X.)

RZESZOW, a town in southeastern Poland and capital of the *wojewodztwo* (province) of the same name. Pop. (1960) 62,526. A settlement developed along the Wislok, a tributary of the San River, between two different types of landscape, the Carpathians and the Sandomierz plain, at the place where the route to Hungary branched from the east-west route through the sub-Carpathian region. Both routes are now used by railway lines. Rzeszow is on the main Cracow–Lvov, U.S.S.R., road and railway. Town rights were probably acquired in the mid-14th century. Rzeszow's development ceased in the 17th century during a period of prolonged wars. After the first partition of Poland in 1772 it was seized by Austria and was not returned to Poland until 1918. The metal industry was greatly built up there after World War II; it includes some of the largest plants in Poland producing rolling stock. Cotton and clothing are also manufactured, and there is an expanding food industry. The town has a museum.

Rzeszow Wojewodztwo borders on the U.S.S.R. and Czechoslovakia. Area 7,203 sq.mi. (18,656 sq.km.). Pop. (1960) 1,586,157. It consists of two regions: the northern (Sandomierz) plain and the mountainous southern region (the Carpathians); the economy of the province varies accordingly. The submontane portion, with its good loess soils, is a populous agricultural area whereas the southeastern corner is sparsely populated. The most important raw materials are sulfur, of which rich deposits were discovered near Tarnobrzeg and industrially exploited in the 1960s; petroleum in the Carpathians; and natural gas. The principal manufacturing activity is the iron-smelting and metallurgical industry at Stalowa Wola and Mielec. Forests occupy about 30% of the area and are important to the economy; and (after Cracow) it is the second most important province in Poland for cattle breeding. Rymanow and Iwonicz are popular tourist resorts. The economic development of the province is impeded by a deficiency of railways and roads. Besides Rzeszow, the principal towns are Przemysl (pop. [1960] 46,000), Jaroslaw (25,500), Stalowa Wola (22,900), Mielec (22,000), Krosno (19,800), Sanok (15,800) and Debica (16,500). (T. K. W.)

RZHEV, a town in Kalinin *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on both banks of the upper Volga, at the crossing of the trunk railways Moscow–Riga and Leningrad–Bryansk. Pop. (1959) 48,971. First mentioned in 1216, when it was an independent princedom, Rzhev has always been a route centre on the western approaches to Moscow and its history has been stormy. At various times under the princes of Tver or Smolensk, and taken by Lithuania in 1356 for two years, Rzhev passed to Moscow in 1390. In 1610, during the Time of Troubles, it was captured by the Poles. In World War II bitter fighting took place there. The modern town has brick and other building-materials industries, butter and meat processing, timber working and flax retting. (R. A. F.)

S THIS letter corresponds to the Semitic W (*sin* "tooth"). The Greek treatment of the sibilants that occur in the Semitic alphabet is somewhat complicated. Semitic ≠ (*samech*) appears in Greek as Ξ (*ksi*) with the value in early times of *ss*, later and more generally of *x* or *ks*. The name *samech*, however, which through its Aramaean form became in Greek *sigma*, was applied to the letter ϟ which corresponded to Semitic W (*sin*) and stood for *s*. In certain Greek alphabets the letter was called by the name *san*. Semitic *ssade* appears in the early alphabets of Thera and Corinth in the form M representing *s*. These alphabets have no *sigma*, while those that have *sigma* do not have M.

Greek forms of the letter were Ϟ, Ɛ, Ϛ, ʃ, Ɛ. A rounded form appeared in the Chalcidian alphabet and from this it was

NAME OF FORM	APPROXIMATE DATE	FORM OF LETTER
PHOENICIAN	1200 B.C.	W

UMBRIAN		ϟ
CLASSICAL LATIN AND ONWARD		S

DEVELOPMENT OF THE LETTER "S" FROM THE PHOENICIAN THROUGH CLASSICAL LATIN TO THE PRESENT FORM

taken into Latin. Etruscan had no rounded form, but it appears in Umbrian and Faliscan. In Latin cursive writing of the 6th century the form was ϒ, and from this descended the Irish and Saxon forms ϒ. The Carolingian form on the other hand was extended above the line instead of below, *e.g.*, ſ. In England in the 17th century the form was ſ and this is occasionally still seen in handwriting when followed by another *s*. The form ß also occurs, the left-hand oblique stroke being really part of a ligature with a preceding letter. There was a Greek minuscule form ϲ or ϲ of the 9th century A.D., which may be the source both of the Cyrillic с and of the lunate *sigma* ϲ used in some fonts of Greek type at the present time. (*See* also ALPHABET.)

The letter represents an unvoiced sibilant. This has become voiced in English when intervocalic (e.g., *houses, nose*). In most other positions it remains unvoiced (e.g., *sing, save, stamp, speak, aspect*). When doubled the letter represents the unvoiced sound in all positions (e.g., *grasses, miss, assess*). In *vision* and other words ending in *sion* the *s*, provided it is not doubled, has the voiced sound *ž*, and similarly in *pleasure, leisure*.

(B. F. C. A.; J. W. P.)

SAADIA BEN JOSEPH (SAID AL-FAYYUMI) (882–942), the greatest figure in the literary and political history of medieval Judaism, was born at Dilaz in Al Fayyum, Egypt. Nothing certain is known of his father or of his early life. Saadia's literary work appears at a time when learning seemed to be dead in both east and west. Since the completion of the Talmud very little of any literary importance, except for a few midrashim, had been produced among the orthodox (rabbanite) Jews, although the Babylonian schools at Sura and Pumbeditha continued to enjoy a somewhat intermittent prosperity. On the other hand, learning was cultivated among the Karaites. In Saadia, however, the rabbanites found a powerful champion. Almost his first work was an attack on the teaching of 'Anan ben David, the founder of Karaism (*q.v.*). This, like most of Saadia's polemical writings, is no longer extant, but something of its contents may be inferred from references in the author's other works and from the statements of his opponents. The controversy turned largely on the calendar, which of course involved the dates of festivals, and, since the rabbanite calendar had come down from ancient times, opened up the whole question of oral tradition and the authority of the Talmud. The conflict raged for many years, the chief representative of the other side being Solomon ben Yeruham, a virulent if not successful opponent. In 922 Ben Meir, a person of importance in Palestine, attempted to make alterations in the calendar, against the authority of the Babylonian schools. Saadia, who was then at Baghdad, warned him of his errors, refuted him in a work called "The Book of the Festivals," and finally procured his excommunication by David ben Zakkai, the exilarch or head of the Jewish community in Babylonia. The exilarch appointed Saadia as gaon (*q.v.*) of Sura, but within two years the exilarch, influenced by rival scholars, dismissed Saadia, while Saadia retorted by declaring the exilarch deposed (930). After three years of contention David ben Zakkai succeeded in sufficiently bribing the new and needy caliph, who definitely forbade Saadia to act as gaon.

The next four years, spent in retirement at Baghdad, were devoted to literary labours. Eventually a reconciliation was effected with David ben Zakkai, favoured probably by the new caliph al-Radi, and Saadia was reinstated as gaon of Sura in 938. Under his brief rule the school attained the highest reputation among the Jewish communities of east and west. His health was broken, however, and he died in 942.

Works.—Saadia's works were for the most part written in

Arabic, the vernacular of the Jews in the east, so that after the breakup of the Babylonian schools in the middle of the 11th century they would be studied only in Spain, the new centre of Jewish learning, and in Egypt. After the expulsion of the Jews from Spain, Arabic practically ceased to be used by them for literary purposes, and in the rest of Europe (except perhaps in southern Italy) it was never understood. Even some Hebrew works, of great modern interest, must have been regarded at the time as of purely temporary value. The anti-Karaite works against 'Anan, Ibn Sakawaihi and Ben Zuta, the *Kitab at-tamyiz, Kitab al-Shara'i, Kitab al-'Ibbur* (calendar) and a book on anthropomorphisms, all in Arabic, are lost and only known from quotations. So also are the refutation of the skeptic Hivi of Balkh, and the *Sefer 'Orayoth* (on prohibited marriage, against Karaites). Of the *Sefer ha-Mo'adim* and *Sefer ha-Galui* (against David ben Zakkai), both in Hebrew, some fragments have been recovered.

Closely allied to Saadia's polemical writings are his exegetical works. He translated most of the Bible into Arabic and commented on at least some of the books; the memorial edition of his complete works, edited by J. Derenbourg (1893), contains part of this work. The translation of the five Megilloth (Song of Solomon, Ruth, Lamentations, Ecclesiastes and Esther) and of Daniel (with commentary), usually ascribed to Saadia, are not really by him, but a genuine translation of Daniel, with commentary, exists in manuscript. There is also ascribed to him a midrashic work on the Decalogue. These all, no doubt, exhibit the defects necessary to the time in which their author lived. But it must be remembered that Saadia was a pioneer. Hayyuj, the father of Hebrew grammar, was not yet born, nor had the scientific and comparative study of the language begun. In this respect Saadia contributed little to the subject. But both translations and commentaries are remarkable for their great learning, sound sense and an honest endeavour to arrive at the true meaning of the original. They were thus admirably suited for their purpose, which was, like the earlier Targums and the later work of Moses Mendelssohn (*q.v.*), to render the sacred text more intelligible to the faithful generally and to check the growth of error.

The grammatical work called *Agron*, a sort of dictionary, is lost, as are also the *Kutub al-Lughah* and perhaps other treatises on Hebrew grammar. The explanation of the 70 (really 90) *hapax legomena* in the Bible (these are words or terms used only once and of uncertain meaning) and a poem on the number of letters in the Bible are extant.

On talmudic subjects again little is preserved beyond the *Kitab al-Mawarith* and a short treatise in Hebrew on the 13 *Middoth* or canons of exegesis of R. Ishmael and some *responsa* mostly in Hebrew. The translation of the Mishna, the introduction to the Talmud and other works of the kind are known only by repute.

Of the *Siddur* or arrangement of the liturgy by Saadia, a large part exists in a single manuscript at Oxford, and several additional fragments were recovered from the Geniza (archive) of the old synagogue at Cairo. Numerous other liturgical poems, or parts of them, were obtained from the same source, and several were subsequently published in periodicals. His *Azharoth*, a poetical enumeration of the 613 precepts, in Hebrew, is included in the complete works.

Saadia's philosophical works are (1) a commentary on the *Sefer Yezira*, a mystical treatise ascribed to the patriarch Abraham, which, as a foundation of the Cabala, had great influence on Jewish thought, and was the subject of numerous commentaries; (2) the *Kitab al-Amanat w'al-I'tiqadat* ("Book of Beliefs and Convictions"), written in 933. Its system is based on reason in conjunction with revelation, the two being not opposed but mutually complementary. It is thus concerned, as the title implies, with the rational foundation of the faith and deals with creation, the nature of God, revelation, free will, the soul, the future life and the doctrine of the Messiah. It shows a thorough knowledge of Aristotle, on whom much of the argument is based, and incidentally refutes the views of Christians, Muslims, Brahmans and skeptics such as Hivi. From its nature, however, the work, although of great interest and value, never had the same wide influence as that of Ibn Gabirol (*q.v.*). The Arabic text was published by S. Landauer (1880), the Hebrew version at Constantinople in 1562 and frequently thereafter. *See* also Hebrew Literature; Jewish Philosophy.

SAALE, a river of Germany and tributary to the Elbe, is 265 mi. (426 km.) long and drains about 10,000 sq.mi. (25,900 sq.km.). It rises in the Fichtelgebirge, and from there flows north and northeast to join the Elbe just above Barby. It crosses Thuringia, first through forested plateau and then through fertile lowland. Its main tributaries are the Ilm and Unstrut (left bank) and Weisse Elster (right bank). Ancient towns along its course include Jena, Naumburg, and Halle. The river has a rapid upper course and an irregular regime. Its upper course has two very large storage dams with lakes: Bleiloch and Hohenwarte. The Saale is navigable by 200-ton barges as far as Naumburg and by those of 1,000 tons to Halle. (R. E. Dt.)

SAALFELD, a town of East Germany, the headquarters of the Saalfeld *Landkreis* (rural district) in the Gera *Bezirk* (district) of the German Democratic Republic. Pop. (1964) 31,048. The town lies 42 mi. (67 km.) SW of Gera by road on the northern edge of the Thuringian Forest. The Saale River flows through the town, which is a railway junction. To the southwest the "fairy grottoes" and the Hubertushöhle are coloured stalactite caves containing mineral springs; they were formerly mines. Nearby to the east of Saalfeld are the state-owned Unterwellenborn iron and steel works. Other industries include the production of electrical machinery, chocolate, and cardboard boxes in Saalfeld; and forestry, slate mining, the manufacture of glass, ceramics, and paper in the rural district.

Saalfeld was first mentioned, in documents dated 899, as a royal palace. A Benedictine monastery was established there in 1074, when the town received its market charter. The present town dates from about 1200 and contains some interesting medieval buildings.

SAAR (French Sarre), a right-bank tributary of the Moselle (Mosel) River, 153 mi. (246 km.) long and draining an area of about 2,800 sq.mi. (7,300 sq.km.). It rises at the foot of the Donon summit in the northern Vosges and flows generally northward to its confluence with the Moselle at Konz, 6 mi. (9 km.) SW of Trier. Within Germany the Saar flows in meanders (which north of Merzig are deeply entrenched and include a remarkable hairpin bend above Mettlach) through the Saar coalfield and the wooded southern outliers of the Hunsrück. Its chief tributaries are the left-bank Nied and the right-bank Blies and Prims. The northern part of the valley is a wine-growing district; the middle stretch between Saarbrücken and Dillingen is a centre of heavy industry. The Saar is canalized upstream of Völklinger and is navigable from its mouth to its junction near Sarralbe (Saaralben) with the 39-mi. Houillères Canal, which joins the Rhine-Marne Canal. (R. E. Dt.)

SAARBRÜCKEN, a city in West Germany and capital of the *Land* (state) of Saarland, Federal Republic of Germany, lies on both banks of the Saar River, 100 mi. (161 km.) SW of Frankfurt. Saarbrücken, which was formed in 1909 from the union of the former Saarbrücken with Malstatt-Burbach and St. Johann, is the centre of the Saar's industrial, commercial, and cultural life. Pop. (1961) 130,705. It is finely situated among wooded hills and has been called the city of parks and Baroque architecture. Among buildings of historic interest are the old town hall and the Baroque Ludwigskirche (both of the 18th century), and the 13th-century Stiftskirche, a Gothic church in the St. Arnual district of the town. The 18th-century castle, formerly belonging to the princes of Nassau-Saarbrücken, stands on the site of the earlier royal castle of Sarabrucca; the castle church is of the 15th century. There is a university, an advanced college for electrical engineering and machine construction, and colleges for adult educa-

tion, arts and crafts, music, local government, and other specialized studies. The town is the seat of the Saar parliament and government and of the government's administrative offices. The district and higher courts meet there.

Situated in one of the world's great coal-mining regions, Saarbrücken is principally an industrial city. Its chief importance lies in its iron and steel industries, but manufactures, which are many and various, include optical instruments, lime and cement, soap, sugar, and foodstuffs. There are breweries, potteries, and printing works. The international Saar fair is held there annually.

Saarbrücken is a frontier town lying at the intersection of Germany's chief arteries of road and rail communication with France, the Netherlands, Belgium, Luxembourg, Switzerland, and Italy, as well as with the rest of Germany. There is an airport to the east of the city in the district of St. Arnual.

History.—The town's history has been traced back to Celtic times from the discoveries of coins, jewels, and other artifacts. During the 1st and 3rd centuries there were Roman settlements where Saarbrücken now stands, but an entirely German settlement was later established by the Franks. The present town grew up around the royal castle of Sarabrucca, built by the Frankish kings and first mentioned in A.D. 999. Its early rulers were the bishops of Metz and the counts of Saarbrücken. The city received its charter in 1321. It belonged to the counts of Nassau-Saarbrücken from 1381 to 1793, when it was occupied by the French. In 1815 it passed to Prussia. Saarbrücken became the capital of the Saarland in 1919. As a vital centre of coal production, industry, and communications, it was subjected to heavy bombing during World War II. By the late 1950s, however, extensive rebuilding had restored it to its former status.

(F.-J. J.)

SAAREMAA (formerly ÖSEL), an island in the Estonian Soviet Socialist Republic, U.S.S.R., lies to the westward of the mainland of Estonia, from which it is separated by the Suur Väin (Sur-Vyain) Strait. To the north and west is the Baltic, to the south the Gulf of Riga. The greatest length of the island is from southwest to northeast, 106 km. (65 mi.), and its area is 1,050 sq.mi. There is a link by causeway with the smaller island of Muhu (Mukhu) to the northeast. The island is low-lying, the highest point being no more than 165 ft. above sea level. Saaremaa consists of Silurian rocks, including limestones, with a covering in places of glacial materials. In parts the surface is stony, soils are poor, and vegetation scanty. Elsewhere the surface is marshy, forest-covered (mainly with coniferous species), or suitable for arable farming or grazing, cattle breeding being the principal farming activity. Fishing is a supplementary occupation. Economic minerals include only various building materials. The largest town on the island is the resort of Kuressaare (Kingisepp) on the south coast, renowned for its mud baths. (J. P. Co.)

SAARINEN, the name of two architects, father and son, both major figures in the development of modern architecture.

(GOTTLIEB) ELIEL SAARINEN (1873–1950) was born Aug. 20, 1873, in Rantasalmi, Fin., and became the foremost architect of his generation in Finland before he moved to the United States in 1923. By 1914 he was widely known in Europe for his Helsinki railroad station (1905–14) and urban planning projects for Reval, Estonia, and Canberra, Austr. In 1922 he won second prize in the Chicago Tribune Tower competition. His design, with its bold approach to massing, had a far more profound influence on skyscraper design in the United States than did the winning design.

From 1932 to 1948 Saarinen was president of the Cranbrook Academy of Art at Bloomfield Hills, near Detroit, Mich., and thereafter, until his death, head of the graduate department of architecture and city planning. He designed a group of buildings in Bloomfield Hills, including the Cranbrook School for boys (1927), the Kingswood School for girls (1931), the Science Museum (1933), and the Art Academy (1934). In 1947 he and his son Eero won the American Institute of Architects' highest award for their design for an addition to the Smithsonian Institution, Washington, D.C. Notable are his two churches: Tabernacle Church of Christ in Columbus, Ind. (1942), and Christ Lutheran Church in Minneapolis, Minn. (1950)—his last and perhaps his finest building. His writings include: *The City: Its Growth, Its Decay, Its Future* (1943) and *Search for Form* (1948). Eliel Saarinen died at Bloomfield Hills on July 1, 1950.

His son, EERO SAARINEN (1910–1961), was born Aug. 20, 1910, at Kirkkonummi, Fin., and began his career in his father's office. They collaborated from 1937 till the elder Saarinen's death in 1950. Eero Saarinen first received independent notice in 1948 for his stainless steel arch that won first prize in the St. Louis Jefferson National Expansion Memorial competition. The General Motors Technical Center in Warren, Mich., built from his design (1948–56), won him national acclaim. Among his other notable works are: chapel and auditorium at the Massachusetts Institute of Technology, Cambridge (1956); U.S. embassy, London (1956); Trans World Airlines terminal at Kennedy (formerly Idlewild) Airport, New York (1962); Dulles Airport, near Washington, D.C. (1962); the Beaumont Theater, Lincoln Center, New York (1963); and the North Christian Church, Columbus, Ind. (1964). Eero Saarinen died at Ann Arbor, Mich., on Sept. 1, 1961.

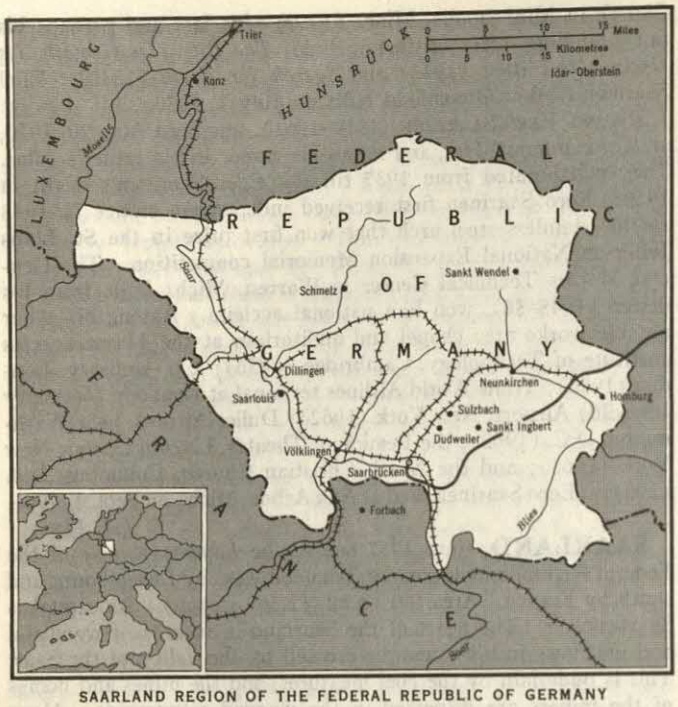
(H. MN.)

SAARLAND, since 1957 one of the *Länder* (states) of the Federal Republic of Germany, bounded west by Luxembourg and south by France. Area 991 sq.mi. (2,567 sq.km.). Its capital is Saarbrücken. The heart of the Saarland is an area of woodland and meadows in hilly country crossed by the valley of the Saar. This is underlain by the coal measures, and the mines and homes of the miners are dispersed in the wooded countryside. Along the valley, from Saarbrücken to Völklingen, are concentrated blast furnaces and steelworks. This lowland is framed northward by the edge of the Hunsrück highland and southward by the scarps of Lorraine. About half the total area is cultivated and nearly one-third is forest. (R. E. DI.)

History.—From 1381 to 1793 the city of Saarbrücken on the Saar River was ruled by the counts of Nassau-Saarbrücken, the territory around it, although inhabited by a German-speaking population, being latterly much influenced, and partially ruled, by France in the 150 years which followed the treaties of Westphalia (1648). After the defeat of Napoleon the Saar Valley was included in the new Prussian province on the Rhine except for a small portion which was given to Bavaria. After World War I the Saar mines were ceded to the French state "as compensation for the damage to the north of France and as part payment toward the total reparation," and in January 1920 the Saar was placed under a governing commission of the League of Nations for 15 years, at the end of which time a plebiscite was to be held enabling the inhabitants to choose between Germany, France, or a continuation of the authority of the League.

The first president of the governing commission was a French chauvinist, Victor Rault. His attitude, and above all the French occupation of the Ruhr in 1923, aroused much anti-French feeling in the Saar, causing the first large-scale miners' strike there which lasted for 100 days. After this the Saar prospered under League of Nations rule, but when the full force of the Nazi propaganda machine was brought to bear upon the Saarlanders in 1933 it was easy enough to arouse antiforeign feelings together with chauvinistic exaltation and personal fear. When it came to the plebiscite on Jan. 13, 1935, the attempts made by the League to ensure a free and secret vote failed to carry much conviction, and more than 90% of the votes went to Germany with 8.8% for the status quo and only 0.4% for France. The Saar territory was therefore handed over to Germany, which bought back the coal mines as the Treaty of Versailles had stipulated.

In 1945 the Saar was occupied by the French. Two years later, having slightly extended its frontiers, the French military governor, Gilbert Grandval, arranged for the election of a representative assembly. The new Diet consisted mainly of representatives of the Christian People's Party led by a Catholic, Johannes Hoffmann, who had opposed the Nazis in 1935, and of Social Democrats; it agreed to the political autonomy of the Saar within a diplomatic, tariff, and financial union with France. By a Franco-Saar convention (1950), the Saar mines were leased to France for 50 years.



SAARLAND REGION OF THE FEDERAL REPUBLIC OF GERMANY

Hoffmann was elected prime minister of the autonomous Saar in 1947. He was attacked by German patriots as the tool of France, but his second success in the elections of November 1952 showed that he was not unpopular. On this occasion his party alone, apart from his Socialist allies, polled 54.8% of the valid votes, while only 24.4% of the voters spoiled their papers to indicate their support of the suppressed pro-German parties. Indeed, because of its autonomy, the Saar recovered economically faster than the rest of Germany, and enjoyed more generous social services. It was only in 1954 that Hoffmann and autonomy lost ground, partly because of the failure of the European Defense Community project with which he linked his policy, and partly because West German prosperity by then magnetically attracted the sympathies of the Saarlanders.

In October 1954 the French and German governments agreed to a statute for the Saar according to which French control should be replaced by that of the Western European Union; the Saarlanders were to give consent to this plan by referendum, the prohibited parties which favoured reunion with Germany being permitted three months before the vote. The referendum was fixed for Oct. 23, 1955, and the pro-German parties therefore began their activities in July, and immediately announced that to reject the statute would be to vote for Germany. Their campaign, dominated by the lawyer, Heinrich Schneider, was passionate, and culminated in rejecting the "Europeanization" of the Saar by 423,434 votes to 201,973. Hoffmann immediately resigned and the pro-German parties formed a government led by Hubert Ney. A new Diet was elected in December 1955, leaving the party position unchanged with the Hoffmann party still holding 13 of the 40 seats. The French agreed in principle to the return of the Saar to Germany and negotiations began early in 1956. In June agreement was reached. The Saar became the tenth *Land* of the Federal Republic of Germany on Jan. 1, 1957. France was allowed to continue to exploit the Warndt coalfield on the Franco-Saar border and to canalize the Moselle between Coblenz and Thionville; concessions were made by France about the projected Alsace Canal and the damming of the Rhine. (E. Wi.)

Population and Economy.—The population of Saarland was 1,072,600 in 1961. In the early 1960s the working population exceeded 410,000, of whom 56% were employed in industry and building (including 47,000 in coal mining and 44,000 in iron and steel production), 19% in commerce and transport, 20% in public and private service, and 5% in agriculture.

The principal towns are Saarbrücken, Neunkirchen (*qq.v.*), Völklingen, Saarlouis (*q.v.*), Sankt Ingbert (*q.v.*), Sulzbach, Homburg, and Dillingen. The population is predominantly Roman Catholic (73%), with 25% Protestants. The common and official language is German, but at the University of the Saarland at Saarbrücken, French and German are on an equal footing.

In July 1959 the economy of Saarland was completely integrated with that of the Federal Republic. Its annual production of about 16,000,000 tons of coal, 3,500,000 tons of pig iron, and 4,000,000 tons of crude steel is the base of French interest in the territory, whose traditional associations are with Germany. The coal is used in the Lorraine iron and steel works, following technical improvements enabling some Saar coal to be made into coke. The Saarland iron and steel works, with more than 25 blast furnaces, draw their ores from the Lorraine ore field.

The industrialized belt lies along the Saar Valley and contains most of the population. Chemical, glass, and ceramic industries are pursued, in addition to coal, iron, and steel, giving the area a balanced economy. The economic future of Saarland, despite its integration in the Federal Republic of Germany, remains closely linked with Lorraine. The region is an important focus of the European Coal and Steel Community (*q.v.*).

The main centre of communication is Saarbrücken, which is an important rail junction and from which a motorway leads eastward to join the Cologne–Basel motorway near Mannheim.

SAARLOUIS, a town of Germany in the Saarland, which in 1957 was included in the Federal Republic of Germany, lies on both banks of the Saar River, 41 mi. (66 km.) S of Trier by road. Pop. (1961) 36,807. Situated on the fringe of the Saar coalfield, Saarlouis has industrial surroundings, especially iron and steel works. It was founded by Louis XIV of France as a fortress, built in 1680–85 by Sebastien Vauban. In 1815 the town was ceded to Prussia, which razed the fortress after 1889. The parade ground and remnants of the fortifications still exist. The town centre, largely destroyed in 1944–45, was rebuilt. From 1936 to 1945 the town was called Saarlautern.

SAAVEDRA FAJARDO, DIEGO DE (1584–1648), Spanish diplomatist and man of letters, born at Algezares (Murcia) on May 6, 1584, is best known for his anti-Machiavellian emblem book, the *Idea de un Principe político-cristiano* (1640; English translation by Sir James Astry, 1700), which urged a return to traditional virtues as the remedy for national decadence; the extent of Saavedra's erudition and his personal knowledge of the Europe of his day are evident. His principal other works are the *República literaria* (1655), of interest as representing Baroque critical attitudes to earlier and contemporary literature, and the *Corona gótica* (1646), a history of Spain under the Goths. He died at Madrid on Aug. 24, 1648.

SAAVEDRA LAMAS, CARLOS (1878–1959), Argentine lawyer, professor, diplomat, and Nobel Peace Prize winner, was born on Nov. 1, 1878, in Buenos Aires. He received the degree of doctor of law *summa cum laude* from the University of Buenos Aires (1903). He held numerous political posts, appointive and elective, in the municipal and national governments of Argentina, including those of minister of justice and public education (1915), and minister of foreign affairs (1932–38). He was Argentine delegate to conferences on world peace and international law, and became a member of learned societies and academies the world over. For his untiring work for world peace he received the Nobel Prize (1936) and numerous decorations and honours from Latin-American and European governments. He held various professorial chairs in the social sciences at the University of Buenos Aires and was rector of that university from 1941 to 1943. He wrote treatises on economics, education, and Argentine and inter-

national law, some of which have been translated into French and English. His most noteworthy work is *Por la Paz de las Américas* (1937). He died in Buenos Aires on May 5, 1959. (C. S. Sn.)

SABA (Sabas), **SAINT** (439–532), founder and first abbot of the monastery of Mar Saba, was born at Moutalaske near Caesarea in Cappadocia (modern Kayseri, Turk.). As a child he joined a local monastery, where he spent ten years before moving to a monastery in Palestine (457). In 469 he became a hermit for five days of the week and in 474 left the monastery to live alone in the western desert. In 478, in obedience to a vision, he moved to a cave by the Kidron, about halfway between Jerusalem and the northern end of the Dead Sea, where in 484 he began to be joined by other solitaries living in cells nearby. He was ordained in 491 and made abbot of his community, the Great Laura of Mar Saba, which is still in existence. Saba was a defender of the faith against the Monophysites, and founded other monasteries and religious houses in Palestine. He died at Mar Saba in 532, on Dec. 5, which is kept as his feast day. *See* also Monasticism: *Eastern Monasticism.*

See H. Leclercq in F. Cabrol (ed.), *Dictionnaire d'archéologie chrétienne et de liturgie,* vol. xv, col. 189–211 (1950).

SABAEANS, a people occupying the kingdom of Saba in pre-Islamic southwest Arabia. Mention of them, and of the kingdom under the name Sheba, is made several times in the Bible, notably in the legend of King Solomon and the queen of Sheba. The Assyrian annals mention two occasions when tribute was sent to the king of Assyria by kings of the Sabai; first, *c.* 715 B.C. by Itiamra, and again about 30 years later by Karibailu. The Greek geographer Eratosthenes (3rd century B.C.) describes the Sabaeans, with a capital at Mariaba (the modern Ma'rib), along with three other folk, the Minaeans, Qatabanians, and Hadhramautites, as constituting the main elements in the population of southwest Arabia. (*See* Arabia: *History: The South Arabian Kingdoms.*) In 24 B.C. a Roman expedition under Marcus Aelius Gallus, prefect of Egypt, had to beat a disastrous retreat after getting as far as Ma'rib. The *Periplus of the Erythraean Sea* (an account of the Red Sea and Indian Ocean, written in Greek and usually dated to the mid-1st century A.D.) speaks of a joint kingdom of Sabaeans and Homerites (Himyar), the royal residence being at Zafar in the southern Yemeni Highlands. A little later Pliny referred to the Sabaeans as a wealthy folk, at the same time describing the Homerites as "most numerous"; but in the Greek authorities of the 4th century onward the names of all these older people fade out, except for the Homerites, a term which they apply indiscriminately to the inhabitants of the whole of southwest Arabia.

These meagre details are capable of being considerably amplified from the vast mass of inscriptions left by the Sabaeans themselves. Unfortunately, these texts are often very difficult to interpret, and many points remain obscure and the subject of sharp dispute among specialists. But paleographic and linguistic criteria indicate pretty clearly that a broad division of the Sabaean inscriptions can be made into three periods, of which, however, only the last can be dated with certainty, namely from the last quarter of the 4th century A.D. to the third quarter of the 6th century.

The kernel of the Sabaeans' land was divided into two parts: a highland area, coinciding with the mountain massif of central Yemen, around present-day San'a'; and a lowland area lying to the east and southeast of the highland area and consisting principally of the extensive drainage basin of the Wadi Adhana. The latter, in its lower course, breaks through a rocky barrier, the Jabal Balaq, and soon afterward loses itself in the Ramlat Sab'atein, a western outlier of the great sand desert of the Rub' al Khali. Just below this opening in the Jabal Balaq is situated Ma'rib, the Sabaean capital. A little to the west, on one of the tributary valleys draining into the Wadi Adhana, is Sirwah, a site second only to Ma'rib in importance. Ma'rib owes its situation and its prosperity to the opening in the Jabal Balaq where it was possible, by the construction of a dam, to control substantial amounts of water for the irrigation of the valley immediately below it. The great dam of Ma'rib figures prominently in Islamic legend, which attributes the downfall of the pre-Islamic civilization of south Arabia to the bursting of the dam. This account probably puts the effect before the cause: it is known from the inscriptions that the dam was extensively repaired in the 5th and 6th centuries A.D., and the likelihood is that it was political weakness that led to inability to continue repairing it, rather than the other way round.

The culture of the Sabaeans, and of the other ancient peoples in the area, is Semitic, having numerous and marked affinities with the culture of the Semitic peoples to the north of them. Unless, therefore, south Arabia is to be envisaged as the original home of the Semites, it must be concluded that in prehistoric times one or more waves of Semitic immigrants entered south Arabia from the north, bringing with them their Semitic culture which they imposed on a pre-Semitic population substratum. An ethnic mingling of this kind is perhaps hinted at by the biblical "genealogies" (fictional, of course, as genealogies in the strict sense, but representing faithfully Hebrew ideas of the geography and ethnology of the world known to the writers): for in Gen. 10:28, Sheba is numbered among the descendants of Shem (*i.e.,* as Semites), whereas in Gen. 10:7, Sheba is also listed as descended from Ham, along with the Egyptians and the peoples of east Africa.

In the early Sabaean period, besides "kings of Saba," individuals are found styling themselves "*mkrb* of Saba." It was for long thought that the latter constituted a dynasty of priest-rulers antedating the institution of the kingship, but more recent research indicates that kings and *mkrbs* were contemporaneous. The modern tendency is to regard the title of *mkrb* as indicating some political function exercised parallel with the kingly function. The early period is characterized above all by a tremendous outburst of building activity, principally at Ma'rib and Sirwah, and most of the great temples and monuments, including the Ma'rib Dam, date back to this period. Further, there was an ever-shifting pattern of alliances and wars between Saba and other peoples of southwest Arabia—not only the important kingdoms of Qataban (Gr. Kattabanoi) and Hadhramaut (Gr. Chatramotitai) but also a number of lesser but still independent kingdoms and city-states.

The date to be assigned to the earliest Sabaean inscriptions is a matter of controversy. Some date them back to the 8th century B.C. This view was founded mainly on the identification of the two "kings of Saba" who sent tribute to Assyria around 700 B.C. with two *mkrbs* of Saba, Yithi'amar and his son Karibail. Unfortunately, both kings and *mkrbs* of the early period used altogether only some half dozen names, which constantly recur in connection with different individuals; hence it is extremely hazardous to attempt to identify an individual by name alone. Another school of thought gives the 5th century B.C. as the beginning of the early Sabaean period, as known inscriptionally. In either case, several centuries of development certainly preceded the appearance of the inscriptional material, for the bulk of the early Sabaean texts already attest a fully evolved civilization. Early Sabaean texts from the highland area are comparatively few, and it is apparent that political and cultural emphasis in this period was centred in the lowlands.

The chronological boundary between the early and middle Sabaean periods is uncertain but may be tentatively regarded as somewhere around the 1st century B.C. In the middle Sabaean period there is no longer any mention of a *mkrb.* The names of the kings were no longer chosen from the restricted list used in the early period. While some kings still contented themselves with the title "king of Saba," the majority had the extended title "king of Saba and the Raydan territory." It is uncertain exactly where the latter was, for Raydan is a geographical name occurring in several places. Some think that Jabal Raydan close to Zafar is meant, which has the advantage of fitting in with the *Periplus* reference to a dual monarchy with the royal residence at Zafar. Otherwise "Raydan" might refer to the peak of that name which is the most conspicuous feature in the landscape of Wadi Bayhan; this would imply that Saba had absorbed the former Qatabanian dominions, which were centred on the Wadi Bayhan.

A number of the middle Sabaean kings had affiliations with the tribe of Hamdan, located in the highland massif; in addition, there is a notable increase in the frequency of texts from this area. Evidently the political emphasis by the middle period had shifted from

lowland to highland Saba. There were still wars and alliances with other peoples of southwest Arabia, but the smaller independent city-states had then disappeared and the tribe of Himyar (the Greek Homerites) made its first appearance on the Sabaean scene. Mention is also made for the first time in the inscriptions of "Arabs," *i.e.*, nomad Bedouin.

Toward the end of the 3rd century A.D., a powerful king named Shamir Yuhar'ish (who seems incidentally to be the first really historical personage whose fame has survived in the Islamic traditions) assumed the title "king of Saba and the Raydan territory and of Hadhramaut and Yamanat." By this time, therefore, the political independence of Hadhramaut had succumbed to Saba, which had thus become the controlling power in all southwest Arabia. In the mid-4th century A.D. it underwent a temporary eclipse, for the title of "king of Saba and the Raydan territory" was then claimed by the king of Aksum on the east African coast (*see* ETHIOPIA: *History: Kingdom of Aksum*). At the end of the 4th century, south Arabia was again independent under the rule of a "king of Saba and the Raydan territory and Hadhramaut and Yamanat." For the events of the 6th century *see* ARABIA: *History*.

Religion.—The religion of the Sabaeans down to the 3rd century A.D., like that of the other peoples of south Arabia, was a polytheism having strong similarities with the cults of the northern Semitic world. Of particular importance in the pantheon was a triad of deities: 'Athtar the Venus-star (masculine in south Arabia, although Sidonian Astarte, Canaanite Ashtoreth, and Mesopotamian Ishtar, all varieties of the same name, are feminine), a moon-god, and a sun-goddess. The moon-god was adored in Saba under the name Ilmuqah, and the function of this deity seems to have been in the early Sabaean period principally that of a national god, whose cult served as a unifying factor, binding together a variety of communities having local cults and loyalties covering smaller areas than the Sabaean state as a whole. "The children of Ilmuqah" appears to be a term roughly equivalent to "Sabaean citizens."

In the middle Sabaean period, on the other hand, the Hamdanid kings and their vassals in the highland area adhered to the cult of a deity named Ta'lab, whose shrine, Riyam, was situated in the Wadi Kharid, which runs northeast from San'a'. At the same time, a detached area of the Ilmuqah cult lay at and around 'Umran in the southwest corner of the highland area.

The ancient polytheism disappeared after the episode of Aksumite domination in the 4th century A.D. There followed a monotheistic cult of Rahman "the merciful" (sometimes also qualified as "the lord of heaven"); and finally in the 6th century explicit Jewish and Christian formulas. In the Christian formulas the name Rahman is applied to the first person of the Trinity, followed by "and Christ Victorious and the Holy Spirit," or "and His Messiah and the Holy Spirit."

(A. F. L. B.)

SABAH, a state of the federation of Malaysia (*q.v.*) forming the northern tip of Borneo. It was formerly a British colony. Pop. (1965 est.) 518,000; cap. Jesselton (pop. [1964 est.] 32,000). Area 29,490 sq.mi. (76,380 sq.km.). Sabah is bounded on the north by the South China and Sulu seas; on the southwest by Sarawak; and on the south by Indonesian Borneo (Kalimantan).

SABANG, a port of Indonesia situated on We Island, about 20 mi. N of Kutaradja, the capital of Atjeh (Achin) Province in northern Sumatra, 308 mi. (496 km.) from Penang, Malaysia (from which it lies due west) and 1,100 mi. (1,770 km.) from Jakarta. Pop. (1960 est.) 10,000.

Sabang, a free port, is the first port of call in the Malay archipelago for vessels coming from the west, being the westernmost point of Indonesia at the entrance to the Straits of Malacca. The harbour, built in 1887, principally as a coaling station, is sheltered by hills and high stretches of coastline from the heavy swell of the Indian Ocean and its strong winds.

SABARAGAMUWA, a province consisting of generally hilly country stretching in an arc along the southwestern flank of the main central highlands of Ceylon. Area 1,893 sq.mi. (4,903 sq.km.). Pop. (1960 est.) 1,080,000. The dominant rocks are the altered sediments of the Khondalites, whose inclinations are apparent in the series of parallel ridges and valleys that are so characteristic of the Ratnapura District, though they are less well developed in the northern part of the province. The ridges of this series increase in height southward till they culminate in the Rakwana Hills (more than 4,000 ft. [1,200 m.]) overlooking the Walawe Ganga, which forms the eastern boundary of the province. On its inland side the province terminates along the line of the great vertical escarpment of the central highlands, which rises to 7,360 ft. (2,243 m.) in Adams Peak.

The major part of the province lies in the wet zone of Ceylon, with rain at most seasons of the year. The annual total approaches 200 in. (5,100 mm.) near Ratnapura but is somewhat less to the north, south, and west. The extreme eastern part of the province, in the Walawe watershed, lies in the dry zone and suffers drought in the southwest monsoon (*see* CEYLON: *Physical Geography*). Much of the province is now under cultivation, and the vegetation of considerable areas has degraded into *kekilla* (fern land).

It is known that Sabaragamuwa was peopled in prehistoric times, and it is thought that it derives its name from the Habaras (Veddas) who once inhabited it. Sabaragamuwa played relatively little part in the ancient civilization of Ceylon, though Adams Peak was very early a place of worship and, from the Polonnaruwa period, of pilgrimage. Later Sabaragamuwa became of greater importance: it was a province under the Portuguese and grew cinnamon for the Dutch. However, much of the province remained uncultivated till the planting of rubber in the 20th century.

Kandyan Sinhalese formed the majority of the population at the 1953 census, but there were also 141,539 Indians (mainly estate workers). The chief towns are Ratnapura (*q.v.*; pop. [1963] 21,582) and Kegalla, both district capitals.

The northern part of the province, around Kegalla, has villages of the wet-zone type, with rice fields and groves of coconut, areca nut, and other trees. Such villages thin out in the central part of Sabaragamuwa and become of dry-zone type on the Walawe watershed. The chief product of a wide area of the province is rubber, which covers about 225,000 ac. Some tea is also grown. The main railway to Kandy runs across the northern tip of Sabaragamuwa, and the Ratnapura area is served by a narrow-gauge line.

(B. H. F.)

SABARKANTHA, a district in the northeast of Gujarat State, India. Area 2,843 sq.mi.; pop. (1961) 918,587. The district, which formed part of Bombay State until 1960, includes some areas of the former Sabarkantha Agency. The agency occupied a large tract in northwestern Gujarat and five detached areas to the southeast; it merged with Bombay State in 1948. The capital is Himatnagar (pop. [1961] 15,287). To the south and west most of the land is cultivated. Chief crops are wheat, rice, millet, cotton, the herb sesamum, and sugarcane. Weaving and the dyeing of silk and cotton yarn are the main industries.

(M. R. P.)

SABATIER, (LOUIS) AUGUSTE (1839–1901), French Protestant theologian, who applied to New Testament studies the methods of historical criticism and, particularly through his symbolic interpretation of Christian dogma, exerted influence on the Modernist movement (*see* LIBERALISM, THEOLOGICAL), was born at Vallon, Ardèche, in the Cévennes, on Oct. 22, 1839. He was educated at the Protestant Theological Faculty of Montauban and the universities of Tübingen and Heidelberg. After four years' work as a pastor he became professor of reformed dogmatics at Strasbourg (1867–73) and then (1877) at the newly established Protestant Theological Faculty at Paris. He died April 12, 1901.

Among Sabatier's works were *The Apostle Paul* (1870; English translation 1891); *Outlines of a Philosophy of Religion* (1897; English translation 1897); and his posthumous *Religions of Authority and the Religion of the Spirit* (1903; English translation 1904).

See E. Ménégoz, "The Theology of Auguste Sabatier of Paris," *Expository Times*, 15:30–34 (1903–04).

SABATIER, PAUL (1854–1941), French organic chemist, shared the Nobel Prize for Chemistry in 1912 with Victor Grignard for researches in catalytic organic synthesis, and particularly for discovering the use of nickel in hydrogenation (the addition of hydrogen to molecules of carbon compounds). Born at Carcassonne, Nov. 5, 1854, Sabatier studied at the École Normale Supérieure and under P. E. Marcellin Berthelot at the Collège de France, taking his doctor's degree in 1880. After a year at Bordeaux, he moved to the University of Toulouse in 1882, where he became professor (1884) and dean (1905).

Sabatier's discoveries formed the bases of the margarine, oil hydrogenation, and synthetic methanol industries, as well as of numerous laboratory syntheses. He explored nearly the whole field of catalytic syntheses in organic chemistry, personally investigating several hundred hydrogenation and dehydrogenation reactions, showing that several other metals besides nickel possess catalytic activity, though in smaller degree. He also studied catalytic hydration and dehydration, examining carefully both the feasibility of specific reactions and the general activity of the various catalysts.

Sabatier's great discovery was made in 1897 when he and his pupil J. B. Senderens passed ethylene over hot nickel, in an effort to prepare a nickel compound of ethylene. They believed that since carbon monoxide, which has unsaturated valences, combines with nickel to form a carbonyl, then ethylene, too, which is also an unsaturated compound, might form an analogous compound with nickel. Actually, they obtained much carbon, indicating decomposition of the ethylene, and some ethane. Concluding that the ethane could have come only from undecomposed ethylene which had been reduced by hydrogen formed from the ethylene which had decomposed, they tried passing a mixture of hydrogen and ethylene over the nickel, and immediately obtained a smooth reduction. (*See* also HYDROGENATION.)

Sabatier was invited to succeed Henri Moissan at the University of Paris, but he remained at the University of Toulouse until his retirement in 1930. He died Aug. 14, 1941.

See H. S. Taylor, *J. Amer. Chem. Soc.*, 66:1615 (1944); H. Vincent, *C. R. Acad. Clerm.-Ferrand*, 213:281 (1941). (P. O.)

SABATIER, PAUL (1858–1928), French historian who is chiefly remembered as a biographer of St. Francis of Assisi, was born at Saint-Michel-de-Chabrillanoux (Ardèche) on Aug. 3, 1858. A Calvinist from birth, he began his studies at the Protestant faculty of theology in Paris in 1880 and became pastor of St. Nicholas, Strasbourg, in 1885. He was expelled from Alsace in 1889 because he refused to become a German subject, and although he was given a parish in the Cévennes, ill health forced him to retire and he devoted himself to historical research. He was professor of Protestant theology at Strasbourg from 1919 until his death there on March 4, 1928.

Sabatier's *Vie de St. François d'Assise* (1893; Eng. trans. 1894) enjoyed an immediate and spectacular success, running through more than 40 editions during its author's lifetime. The work, however, has many defects, not the least of which is Sabatier's disregard for the ideal of historical objectivity. He viewed St. Francis as an earlier counterpart of the 19th-century Protestant liberal, whose obedience to the church was mere conformity and who was in reality the leader of the laity in the 12th century in rebellion against ecclesiastical authority.

SABAZIUS, in Greek mythology, a Phrygian or Thracian deity frequently identified with Dionysus and sometimes with Zeus. His worship, which was connected with that of Cybele and Attis, reached Greece in the 5th century B.C. By the late 2nd century B.C. Jews in Asia Minor identified Zeus Sabazius with their God of Sabaoth (God of Hosts). The etymology of the name Sabazius is uncertain. The commonest representation of him is in the form of a votive hand with the fingers in the gesture of benediction, adorned with various emblems whose significance is obscure.

See K. Prümm, *Religionsgeschichtliches Handbuch für den Raum der altchristlichen Umwelt*, 2nd ed., p. 650 (1954); C. Blinkenberg, *Archaeologische Studien*, pp. 66–128 (1904). (H. W. PA.)

SABBATAI ZEBI (ZEVI or SEBI) (1626–1676), Jewish Cabalist and pseudo-Messiah, was born in Smyrna (modern Izmir, Turk.) of Spanish descent. As a boy he was attracted by the mysticism of Isaac Luria (*q.v.*), which led him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy, and attracted a steadily increasing number of followers. Sabbatai began to dream of the fulfillment of messianiac hopes, being supported in his vision by the outbreak of English millenarianism (*see* MILLENNIUM). Christian visionaries had fixed the year 1666 for the millennium, and since Sabbatai's father, Mordecai, was the Smyrna agent for an English firm, Sabbatai often heard of the expectations of the English Fifth Monarchy men (*q.v.*). In 1648 (the year the cabalists had calculated as the year of salvation), Sabbatai proclaimed himself Messiah. He left Smyrna in 1651 and went first to Salonika, an old cabalist centre, and then to Constantinople, where he encountered a man who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited redeemer. He journeyed to Palestine and then to Cairo, where he secured the support of Raphael Halebi, a philanthropist and treasurer of the Turkish governor. With a retinue of believers and considerable funds, Sabbatai returned in triumph to the Holy Land, transferring the centre of his growing movement to Jerusalem. Nathan of Gaza assumed the role of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai, "riding on a lion with a seven-headed dragon in his jaws." Again 1666 was given as the apocalyptic year.

Threatened with excommunication by the rabbis of Jerusalem, Sabbatai returned in the autumn of 1665 to Smyrna, where he was received with wild enthusiasm. From the Levant the Sabbatian movement spread to Venice, Amsterdam (hailed particularly by the numerous marranos who had fled there from Portugal), Hamburg, London, and other centres of Europe and north Africa. Day by day Sabbatai was hailed by all the world as king of the Jews.

At the beginning of the fateful year 1666 he went (or was summoned) to Constantinople. He was placed under arrest, but the reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos, where, in prison, he lived like a king, holding court and even receiving foreign delegates. In September Sabbatai was brought before the sultan, and he had not the courage to refuse to accept Islam. He became a Muslim and was appointed doorkeeper to the sultan. The messianic imposture thus ended in the apostasy of Sabbatai. He died in obscurity in Albania in 1676.

A sect of Muslim Sabbatians—the Donmeh of Salonika—survived him, and within the Jewish faith the controversy for and against his Messiahship continued up to the modern period, erupting into the Frankist movement in southern Poland and Czechoslovakia in the 18th century (*see* FRANK, JAKOB).

BIBLIOGRAPHY.—H. H. Graetz, *History of the Jews*, vol. v (1926). Israel Zangwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto* (1898). *See* also Gershon Scholem, *Major Trends in Jewish Mysticism* (1941); Josef Kastein, *The Messiah of Ismir, Sabbatai Zevi* (1931); H. C. Schnur, *Mystic Rebels* (1949); S. Schechter, *Studies in Judaism* (1958).

SABBATARIANISM, the doctrine of those Christians who regard the first day of the week as a sabbath (*q.v.*), asserting the perpetual obligation of the Fourth Commandment (Ex. 20:8–11; Deut. 5:12–15), which forbids work on the sabbath because it is a holy day. The transference of the name sabbath to Sunday was first made by Alcuin (8th century), and in 1647 the Westminster Assembly gave the classic statement of this position: "From the beginning of the world to the resurrection of Christ, God appointed the seventh day of the week to be the weekly Sabbath; and the first day of the week, ever since, to continue to the end of the world, which is the Christian Sabbath" (*Shorter Catechism*, question 59). Over against this there were those who contended that the Fourth Commandment, being part of the ceremonial, not the moral, law, was completely abolished by Christ, and that a totally new and different kind of day began with his resurrection, toward the observance of which the only guides were the nature of the gospel and Christ's own relation to the sabbath. Glad worship was the keynote of the new, as respite from servile toil had been of the old (*see* SUNDAY).

In Christianity today there are many shades of opinion, which

combine, in varying proportions, these two positions. The name Sabbatarian is given to those trends which appear to give too much weight to continuity, and, in consequence, to be concerned mainly with the things that may not be done on that day. Sabbatarianism in this sense of excessive strictness in observance of Sunday, and legislation on the subject, is as old as the time of Constantine, who decreed regulations against Sunday labour in 321, but in its most stringent form it was a creation of the Scottish and English Reformers, especially John Knox. With the Puritans and the Scottish Presbyterians it came to the United States, where possibly the most rigorous "blue laws" were enacted (*see* BLUE LAWS). Though much reduced in number, and still more in effect, Sunday observance laws are still successfully promoted in England by the Lord's Day Observance Society, and in the United States there are many effective state or local laws barring certain business activities (*e.g.*, selling of liquor, automobiles, or real estate) and sporting events on Sunday.

A few Christian communities hold that the whole church went astray in changing, without express divine command, the weekly holy day from the seventh day to the first; the largest of these bodies is the Seventh-day Adventists, whose central theological principle is loyalty to the Ten Commandments, with special emphasis on the Fourth. But these groups of "seventh dayers" are not those to whom the name Sabbatarian is commonly given.

(H. WA.)

SABBATH, the seventh day of the week as a day of rest and sanctification according to the Jewish religion.

In the Pentateuch the institution of Sabbath is connected with various ideas. (1) It is associated with the doctrine of creation: the creation of the world was completed in six days; and God rested on the seventh day (Gen. ii, 1–2; Ex. xx, 11). (2) Sabbath has a social aspect: it is a day of rest for all men, servants and strangers (Ex. xx, 10; Deut. v, 12–15; Ex. xxiii, 12), and thus stands for the idea of equality of man. On that day there is neither master nor slave; in rest all men are alike. (3) Sabbath also is associated with the idea of holiness: "You shall be holy . . . and you shall keep my sabbaths" (Lev. xix, 1–3). (4) Sabbath is a covenant between God and Israel: "Wherefore the people of Israel shall keep the sabbath, observing the sabbath throughout their generations, as a perpetual covenant. It is a sign for ever between me and the people of Israel" (Ex. xxxi, 16–17). All these ideas must have arisen in different times; their historical sequence, however, is difficult to establish.

Observances.—In the prophetic writings the people are continuously admonished to keep the Sabbath holy. Few commandments received the same emphasis. Deutero-Isaiah connects it with doing justice and righteousness: "Keep justice and do righteousness . . . Blessed is the man who does this . . . who keeps the sabbath, not profaning it, and keeps his hand from doing any evil" (Isaiah lvi, 1–2). The attainment of the highest blessings is made dependent on the keeping of the Sabbath (Isaiah lviii, 13–14). Jeremiah warns the people of the impending destruction of the Temple as a punishment for their desecration of the Sabbath: "But if you do not listen to me, to keep the sabbath day holy . . . then I will kindle a fire in its gates" (Jer. xvii, 27). Ezekiel singles out the sin of desecration of the Sabbath along with that of idolatry, as the only reasons for the wrath of God (Ex. xx, 13–24).

The strict observance of the laws of Sabbath since ancient times may be seen from the book of I Maccabees (ch. ii). When the soldiers of Antiochus Epiphanes were arrayed against the Jews on the Sabbath, the Jews "answered them not, neither cast they a stone at them . . . And they rose up against them in battle on the Sabbath and they died, they and their wives and their children." Realizing that this policy could lead to the annihilation of the people, the Maccabees took counsel and decided, "Whosoever shall come against us to battle on the Sabbath day we shall fight against him and we shall in no wise all die." It was later established as a rule by the authorities that in war the laws of Sabbath are suspended (Babylonian Talmud, Sabbath 19*a*). The Essenes went to the extreme of not leaving their houses on that day (Josephus, *Wars of the Jews*), and the Jewish sect of Karaites followed this practice, assigning literal meaning to Ex. xvi, 29: "let no man go out of his place on the seventh day." Since the Sabbath begins Friday at sunset, they also insisted on remaining in darkness on Friday night, basing their action on their interpretation of Ex. xxxv, 3. On the other hand, rabbinic law ordained the kindling of lights before the beginning of Sabbath, and upon the lady of the house imposed the duty of inaugurating the Sabbath with a benediction on the kindling of lights.

In the Pentateuch there is no general definition of the kinds of work prohibited. There are, however, specific references to interdicted labours, such as plowing and harvesting (Ex. xxxiv, 21), the kindling of fire (Ex. xxxv, 3), gathering of wood (Num. xv, 32–36) and baking and cooking (Ex. xvi, 23). The types of work prohibited on Sabbath were established by the rabbinic authorities as consisting of 39 main categories of work and are enumerated in the tractate Sabbath of the Talmud. The basis for the derivation of these prohibited categories was the consideration of the kinds of work the Jews must have performed while in the wilderness in connection with the building of the Tabernacle. From each of the main categories of work cognate types were derived.

The positive duties of Sabbath observance are to wear one's best clothes, to rejoice (derived from Isaiah lviii, 13) and to eat at least three meals during the day. Before the evening meal a special blessing of sanctification, Kiddush, is read. An abbreviated Kiddush is recited before the meal following the morning service (*see* KIDDUSH AND HABDALAH). The service in the synagogue includes psalms extolling the majesty of God's work and of the Sabbath day. The entire Pentateuch is divided into sections (*Sidroth*), designed to be read on the 52 Sabbaths of the year. A prophetic selection (Haftarah; *q.v.*) is chanted after the reading of the Torah.

At the conclusion of the Sabbath a special blessing (Habdalah) is recited, emphasizing the idea of separation or distinction—separation between Sabbath and weekdays, between the holy and the profane, between light and darkness, etc. In the evening service at the end of the day a reference to the idea of separation is included in the prayer for wisdom and understanding. The concept of separation and discrimination is as indispensable to understanding as is the act of identification.

The precepts prohibiting all kinds of work on the Sabbath are suspended in case of danger to life. A very ancient rabbinic text reads: "It is written: 'You shall keep the Sabbath, because it is holy for you' [Ex. xxxi, 14], the Sabbath is given to you, you are not given to the Sabbath" (Talmud, Yoma 85*b*). The laws of Sabbath are thus not ends in themselves but are subordinated to a higher principle, the enhancement of human life. The statutes of the law were given that man might live by them (Lev. xviii, 5; Yoma 85*b*). The Sabbath laws are suspended even when the danger to health is doubtful. Where human life or health is jeopardized, "It is better to profane one Sabbath for the sake of making possible the observance of many Sabbaths" (Yoma 85*b*). All affairs of business, even when they do not involve physical exertion, are prohibited on the Sabbath. But the law allows the exercise of offices of humanity, such as caring for the poor, and attending to communal matters, as well as the hiring of a teacher, even for the purpose of teaching one's child a trade (Talmud, Sabbath 150*a*).

Some of the pagan Greek and Latin authors attacked the institution of Sabbath on the ground of its wastefulness; to be idle every seventh day is to lose a seventh part of one's life. Because of the Sabbath, the Roman emperors exempted Jews from military service. In modern times the austerity of the Sabbath laws has been criticized, but in fact, in the great age of faith, the Sabbath was pre-eminently a day of spiritual delight, not of either idleness or austerity. Complete abstention from the profane tasks of everyday life made possible the cultivation of intellectual and spiritual interests; worship in the synagogue, study of religious literature, and discourses on religious subjects occupied the better part of the day. It was a day of happiness and spiritual joy that guarded the Jew against the strains and stresses of a hostile world in the long history of his wanderings. "More than the Jew kept the Sabbath, the Sabbath kept the Jew." The close relationship

between the observance of the Sabbath and the preservation of Israel was expressed in a poem by Abraham ibn Ezra (12th century): "I keep the Sabbath, God keeps me; it is a sign between Him and me."

Origin.—The question concerning the origin of the Sabbath and the part it played in the life of the Israelites before the Exile is still shrouded in mystery, despite the attempts that have been made to shed light upon it. Friedrich Delitzsch (*Babel und Bibel*) was the first to propound the theory of the Babylonian origin of the Jewish Sabbath. From Babylonian sources it is known that certain days of the month, the 7th, 14th, 21st and 28th, were days in which the king might not perform certain acts, such as eating roast flesh, changing his dress, offering sacrifice, mounting his chariot or pronouncing judgment; neither might the *magus* prophesy, nor the physician minister to the sick. Thus Delitzsch found the original home of the biblical Sabbath in Babylonia. This theory remains unconvincing for the following reasons: The Babylonian days were "evil days," not propitious for certain actions. Furthermore, those actions were prohibited only to particular persons, such as the king, the *magus* and the physician. In addition to the days mentioned, the 19th day of the month also was an "evil day," on which those actions were prohibited. Those days in the Babylonian calendar must have had their origin in some magical concept. This has nothing in common with the biblical Sabbath as a day of rest for all men, slave and stranger included—an institution that is bound up with the ethical and monotheistic concept of God as Creator. To be sure, the name Sabbath seems to have its origin in Babylonia. It may be a loan word from the Babylonian *Šappattu*, or *Šabbattu*, the 15th day of the month; it is, however, equally possible that both *Šappattu* and Sabbath are derived from a common ground in a prehistoric Semitic tradition. In any case there is a long step from days of taboo to a day of spiritual delight.

There is no evidence of Sabbath observance in the patriarchal period. The references in the historical and prophetic books of the Bible seem to indicate that a close connection existed between the Sabbath and the new-moon festival, and much has been made of the passages implying such a connection. When the Shunammite proposed to visit the prophet, her husband asks: "Why will you go to him today? It is neither new moon nor sabbath" (II Kings, iv, 23). Hosea warned the people in the name of the Lord: "And I will put an end to all her mirth, her feasts, her new moons, her sabbaths, and all her appointed feasts" (Hosea ii, 11). Amos denounced the dishonest traders who say: "When will the new moon be over, that we may sell grain? And the sabbath that we may offer wheat for sale?" (Amos viii, 5). In excoriating the offensive manner of the religious observances, Isaiah says: "Incense is an abomination to me. New moon and sabbath and the calling of assemblies" (Isaiah i, 13). New moon and Sabbath thus are commonly linked together. Hosea implies that Sabbath and new moon were days of festal joy, and from Amos it follows that on those days ordinary business activity was suspended. That carrying any burden on the Sabbath was not allowed can be seen from Jer. xvii, 21–27. That it was customary to visit the Temple on Sabbath days is clear from Isaiah lxvi, 23: "From new moon to new moon, and from sabbath to sabbath, all flesh shall come to worship before me." The linking together of Sabbath and the new moon led I. Meinhold to suggest that the Sabbath must have been originally the day of the full moon, since the counterpart of "new moon" is "full moon" and not the seventh day of the week. It is further noted that among the Phoenicians the new moon and the full moon were the chief days of sacrifice.

Various theories have been suggested as to when the day of the full moon became the Sabbath. Meinhold attributes the change to Ezekiel. S. Mowinckel suggests a time shortly before the Exile. Max Weber rejects the exilic origin of the Sabbath, citing Neh. xiii, 15 as clear demonstration that those who remained in Palestine knew of the Sabbath as a weekly day. These theories, however, are little more than stabs in the dark, since the transition from a moon-oriented day to the unvarying observance of a seventh day is left unexplained. The law of *Shmita* (*i.e.*, the sabbatical year) is associated with the Sabbath day. Both require cessation of work, the former prohibiting work in general on the seventh day and the latter forbidding agricultural labour in the seventh year. The law demanding the release of slaves in the seventh year (Ex. xxi, 2) again suggests the Sabbath as occurring on the seventh day. (*See* JUBILEE, YEAR OF.)

Max Weber accepted the theory that the Sabbath is related to the Babylonian *Šappattu*, but only as a matter of common heritage and not as a borrowing from Babylonia. Weber argued on the basis of Neh. xiii, 15 that the seventh day was originally a day of rest and joy, on which the farmers came to the town markets to sell their produce and perhaps also to amuse themselves. He compared this day with the Roman *nundinae*, the first day of the eight-day week, which had the same social function in Roman life. Likewise, Eduard Meyer compared the Sabbath with the Roman *nundinae*, stressing the economic-social origin of the holiday. He repudiated the connection of the week-day Sabbath with the moon and considers its association with the Babylonian *Šappattu* improbable. He left the name Sabbath unexplained, however. The analogy of the Roman *nundinae* with the Sabbath, as it appears to Meyer and Weber from Nehemiah, is a sociological hypothesis, thus repudiating the speculations of an astrological origin of the Sabbath.

The nature of the Sabbath, however, can hardly be deduced from references to the practice of the people at a certain historical period. This practice was more likely a deviation from a previously existing law or tradition. In denouncing the people for their conduct on the Sabbath and characterizing it as a profanation, Nehemiah clearly implied the prior existence of a different tradition. " 'What is this evil thing which you are doing, profaning the sabbath day? Did not your fathers act in this way, and did not our God bring all this evil on us and on this city? Yet you bring more wrath upon Israel by profaning the sabbath' " (Neh. xiii, 17–18). Not the practice of the people, but rather Nehemiah's reaction to their practice should serve as a basis for the understanding of the original nature of the Sabbath as a Jewish institution. Nehemiah is here not instituting something new but referring to a hallowed tradition concerning a day of rest, the profanation of which has in the past brought down upon Israel the wrath of God.

The various attempts to explain the origin of the Sabbath do not take into account the probability of a core of Mosaic or prophetic legislation with which the Sabbath law was closely connected. Admitting that biblical legislation in the form in which it came down to us is of a later date, its essential elements, such as the contents of the Decalogue, were known as a Mosaic tradition, as can be seen from the prophetic references to the "law of Moses." The laws relating to Sabbath as a rest day for all men, to the sabbatical year and to the release of slaves in the seventh year of servitude, imposing restrictions on ownership and on the power of the individual, were revolutionary and idealistic in character; apparently they were grounded in a concept of property and labour closely connected with the prophetic philosophy of God and man. Just as the prophetic concept of ethical monotheism was a new, indeed a unique idea, neither to be derived from, nor to be reduced to the various conceptions of God prevalent in the ancient world, so was the biblical institution of the Sabbath. The new concept of God transformed the sociological and astrological raw material into a new institution; with the result that the analogies to the Sabbath that can be found in the ancient world serve only to accentuate its uniqueness.

Modern Period.—Conservative and Reform Judaism have been confronted by the problem of Sabbath observance in the modern age. Conservative Judaism has not developed a unified point of view with regard to the laws of Sabbath observance. The traditionalists of that movement deny that there is any difference between conservative and orthodox Judaism as to observance of the law. The spokesmen of the liberal wing of the movement plead for certain changes, taking into consideration the conditions of modern life, such as allowing travel to the synagogue. Such modifications, however, have not received the unanimous approval of the official authoritative bodies.

The Reform movement also has wrestled with the problem of

preserving the Sabbath under modern conditions. It realizes the serious obstacles standing in the way of full observance of the Sabbath laws. The consensus, however, is that Sunday could never become the Jewish Sabbath. The institution of public services on Sunday aims merely at reaching those who are prevented from observing the Sabbath. The distinctive character of the Sabbath as a day of sanctification is necessarily bound up with the Sabbath as hallowed by tradition. A day of rest could be shifted to another day. But Sabbath is the symbol of the covenant of Israel with God and of creation; it is therefore indispensable for the Jew as a sign of his religion. If it is difficult to observe the day in accordance with traditional prescription, it is necessary to strive to observe it to the best of our ability. The humanitarian idea of the Sabbath has a universal message, which constitutes an essential element of the Jewish religion. Recognizing the distinctive and the positive idea of the day, Reform Judaism has striven to preserve it. Such an authoritative body as the Central Conference of American Rabbis recommended conscientious abstention from all those activities that would obscure the difference between Sabbath and the weekdays. By emphasizing in practice the line of cleavage between Sabbath and the weekdays, the idea of the Sabbath will be preserved and intensified. Reform Judaism instituted late Friday evening services and the reading of the Torah portion at that hour. This, of course, is in addition to the regular Sabbath morning Torah service. Reform liturgy provides also for a service in the home (Kiddush). These provisions aim at preserving the Sabbath in its essential elements.

Christianity.—The position Jesus took—that "the sabbath was made for man, not man for the sabbath" (Mark ii, 27)—was essentially in keeping with the rabbinic saying cited above. It appears, however, that Jesus or his followers went far beyond the rabbis in the application of this. The early Christians taught that the principle of the love of God superseded the law of Moses. Jesus thus justified the conduct of the disciples in plucking ears of corn on the Sabbath, though this act violated the rule prohibiting harvesting. He himself, in healing the sick, broke the rule that one should not administer aid to a sick man when it involves a transgression of the precepts of Sabbath, except when life is threatened. For Jesus and for his followers, the love of God was a surer guide of conduct than mere obedience to the law of Moses.

The Jewish Christians of the early church continued to observe the Sabbath. According to Eusebius, the Ebionites kept both the Sabbath, as a memorial of the creation, and the Lord's day (Sunday), the weekly celebration of the Resurrection; and this was the general practice of the early Christians, as recommended by the Apostolic Constitutions (*see* CONSTITUTIONS, APOSTOLIC). The Eastern Church in recognizing the festive character of the Sabbath and prohibiting fasting on that day is in accordance with Jewish law. The spread of Christianity to the gentile world brought about a change in the Christian attitude. Paul began by insisting that the Jewish Sabbath was not binding on Christians. He ended by asserting that the principle of love was in contradiction of the law of Moses, and bitterly condemned the Christians who abided by the laws of Sabbath (Col. ii, 16 and Gal. iv, 9–11).

Chiefly because of the fact that the Resurrection took place on Sunday (*q.v.*), that day eventually replaced the Sabbath in Christian religion. A few post-Reformation bodies (as the Seventh-day Adventists) observe the Sabbath rather than Sunday.

SABELLIANISM, a Christian heresy, a more developed and less naïve form of modalistic monarchianism, propounded by Sabellius (fl. *c.* 215–*c.* 220), possibly a presbyter, who worked in Rome toward the end of the pontificate of Zephyrinus (*c.* 199–217) and during that of Calixtus I (217/218–222). Little is known of Sabellius' life, the most detailed information extant deriving from the prejudiced reports of the contemporary antimonarchian Roman theologian Hippolytus (*Refutatio* ix). The scene of his theological activity was Rome, where the struggle was in full swing between those who affirmed permanent distinctions ("persons" in the language of later theology) within the Godhead, and the monarchians or modalists, who in their concern for the divine "monarchy" (*i.e.,* the absolute unity and indivisibility of God) denied that such distinctions were ultimate or permanent. Sabellius, who became the acknowledged leader of the latter party, giving their teaching its fully developed form, appears to have taught that the Godhead is a monad, expressing itself in three operations: as Father, in creation; as Son, in redemption; as Holy Spirit, in sanctification. It is possible (the evidence is uncertain) that he also held that the divine monad underwent a process of "expansion" or "extension," projecting itself first as Son and then as Spirit. Sabellius thus advanced on the earlier monarchianism in finding a place in his system for the Holy Spirit, in avoiding the patripassian idea that the Father suffered, and in approximating to the Catholic doctrine of the Trinity.

Pope Calixtus was at first inclined to be sympathetic (indeed, according to Hippolytus, it was he who first corrupted Sabellius' ideas), but then condemned the teaching and excommunicated Sabellius. The heresy broke out afresh 30 years later in Libya to be opposed by Dionysius of Alexandria (*see* DIONYSIUS, SAINT). In the 4th century Arius accused his bishop of Sabellianism, and throughout the Arian controversy this charge was leveled at the supporters of Nicene orthodoxy, whose emphasis upon the unity of substance of Father and Son was interpreted to mean that they denied any personal distinctions within the Godhead. (*See* ARIANISM.)

Marcellus of Ancyra was constantly attacked on these grounds, and although perhaps not a strict Sabellian he did maintain that the monad expanded into a dyad at creation and into a triad at the outpouring of the Spirit, and that after the Last Judgment the process would be reversed. About 375 the heresy was renewed at Neocaesarea, being attacked by Basil the Great, and in Spain Priscillian seems to have enunciated a doctrine of the divine unity in Sabellian terms.

At the Reformation Sabellianism was reformulated by Michael Servetus (*q.v.*) to the effect that Christ and the Holy Spirit are merely representative forms of the one Godhead, the Father. In the 18th century this was the teaching of Emanuel Swedenborg (*q.v.*), who asserted that "by three persons I understand three proceeding divine attributes, which are creation, redemption and generation . . . before the creation of the world this Trinity did not exist"; Father, Son, and Holy Spirit are therefore "three Modes of manifestation." Sabellianism is thus perpetuated by the New Church (*q.v.*) founded by Swedenborg's disciples. *See* also MONARCHIANISM.

SABELLIC (from Latin *Sabellus,* "Samnite") has often been used of a minor group of the Italic dialects (*q.v.*), the pre-Latin dialects of the Paeligni, Marrucini and Vestini (better called North Oscan), of the Volsci, and of the Marsi, Aequi, Sabini and other central Italian tribes (conveniently called Latinian); these dialects are all closely related to Oscan (*q.v.*). The same name, or sometimes Old Sabellic, is also used, but inaccurately, to describe two small but distinct groups of inscriptions from various sites near the east coast of central Italy: (1) from Novilara and Fano (near Pesaro); (2) from Belmonte Piceno, Cupra Marittima, Castignano, Bellante, Grecchio and Superequo. These may be better designated, by "East Italic."

The second group, not more recent in date than the 6th century B.C., are doubtless the oldest written documents known from Italian soil. The lines of writing run alternately left to right and right to left, the positions of the letters being both reversed and inverted in the lines written right to left. Their alphabet is clearly of the same Chalcid-Etruscan origin as that of all the other alphabets of ancient Italy (except the Greek and Phoenician), but shows some peculiarities which suggest direct Greek influence;

the language, still untranslated, will probably prove to be an Indo-European (two I.-E. stems, *pater* "father," *mater* "mother" have been identified) and ancient Illyrian dialect (*meitime* is an Illyrian name). For it is known from the elder Pliny, from the Iguvine tables (*iapuzkum* "Iapydian," *i.e.*, "belonging to the Illyrian Iapydes"), and from archaeological evidence, that there were Illyrian settlers in or near that district, the ancient Picenum, where these inscriptions were discovered.

But the documents of the Novilara group are later in date, distinct in alphabet—this is perhaps of Etruscan origin, but shows certain resemblances both to the Umbrian and to the Oscan alphabets—and probably also in dialect. The suggestion that the dialect, however, is allied to Etruscan itself, is quite unsupported by the evidence; the decorative motifs, for example the spiral, which appear on all three of the inscriptions of this group, point rather to the opposite coast of the Adriatic, where similar motifs occur, especially round Nesazio, on contemporary monuments; and there is nothing in the word forms of these documents which may not be Indo-European, while the characteristic Etruscan syncope and elision (at least in the writing) are entirely lacking.

SABIANS, a name given by Arab chroniclers to two different religious groups whom they confused: the Mandaeans (*q.v.*) and the pagan inhabitants of Harran (*q.v.*; a city of Mesopotamia now in eastern Turkey just north of the Syrian border). Sabians (*i.e.*, Mandaeans) are mentioned three times in the Koran together with Jews and Christians. According to tradition the 9th-century moon worshipers of Harran claimed to be Sabians in order to be granted by the Muslims the same religious privileges as Jews and Christians. These "Sabians," usually called pseudo-Sabians by modern scholars, made Harran a flourishing centre of learning in the 9th–10th centuries, and the astronomer al-Battani belonged to their number. In the 13th century they were overwhelmed by the Mongols.

The Sabians should not be confused with the Sabaeans, who were pre-Islamic inhabitants of the kingdom of Saba, in southwest Arabia (*see* SABAEANS).

SABINE, SIR EDWARD (1788–1883), English astronomer and geodesist known for his work on terrestial magnetism, was born in Dublin, Ire. on Oct. 14, 1788. He served in the Royal Artillery and was appointed astronomer to the arctic expeditions of Sir John Ross (1818) and Sir William Parry (1819; *qq.v.*) in search of the northwest passage. From 1821 to 1823 Sabine conducted pendulum experiments, to determine the figure of the earth, on the coasts of Africa, America and the arctic, publishing the results in 1825. These experiments he continued on the length of the seconds pendulum in London and Paris, the results appearing in 1828, in which year he was appointed one of the three scientific advisers to the admiralty. Most of his life was devoted to researches on terrestial magnetism, and he superintended the establishment of magnetic observatories on British territory throughout the world. The results appeared in *Observations on Days of Unusual Magnetic Disturbance* (1843). In 1852 he discovered a connection between the periodic variation of sun spots and magnetic disturbances on the earth. Sabine was president of the Royal society (1861–71) and was made a knight commander of the Order of the Bath (1869). He died at East Sheen, Surrey, on June 26, 1883.

SABINE RIVER in the southwestern United States flows southeast and south for 576 mi. from Hunt county in eastern Texas to Sabine lake and on through Sabine pass into the Gulf of Mexico. The drainage basin of 10,400 sq.mi. lies entirely in Texas and in the Louisiana coastal plain. Discharge of the river varies from 372 to 61,200 cu.ft. per second. From southeast Panola county, Tex., to the gulf the Texas-Louisiana boundary follows the river, Sabine lake and Sabine pass. The Sabine has successively served as a boundary between France and Spain, Spain and the United States, Mexico and the United States, and Texas and Louisiana; it has been in dispute many times.

The Sabine-Neches waterway, a portion of the Gulf Intracoastal waterway, provides 52 mi. of deep waterway through Sabine pass, along western Sabine lake and the lower Neches river to Beaumont, Tex., and 44 mi. of deep waterway to Orange, Tex., located 10 mi. N. of the Sabine river mouth. The Neches river, originating near Tyler, Tex., flows 280 mi. S.E. to Sabine lake.

Commodities transported on the waterway are mostly crude petroleum and petroleum products. Navigation of the river above Orange, Tex., is not important. Port Arthur, Tex., is another important city on the Sabine-Neches waterway. (M. W. M.)

SABINI, an ancient Italic tribe which had very close relations with early Rome. Its people lived in the mountainous country east of the Tiber, and north of the Latins and Aequi, with the Umbrians on the northwest and the Picenes on the northeast. Many probably lived in hilltop villages; their chief towns were Reate (Rieti), Amiternum (San Vittorino, near L'Aquila), and Nursia (Norcia), and in early times Cures, Nomentum, and Fidenae (all near the Tiber). They were well known for their religious practices and beliefs, and many Roman institutions (*e.g.*, the worship of Jupiter, Mars, and the Sabine Quirinus, and the form of marriage called *confarreatio*) were said to have derived from them. The story of the rape (seizing) of the Sabine women by Romulus' men is legendary; thereafter the Sabine king Titus Tatius is said to have captured the Capitol at Rome through the treachery of Tarpeia, daughter of the Capitol's commander, and then to have ruled jointly with Romulus. But their successor at Rome, the Sabine Numa Pompilius (*q.v.*), has greater claim to historicity. The view is widely accepted that the people settled on the Quirinal and Esquiline hills (practising burial by inhumation) who joined with another people on the Palatine Hill (practising cremation) to form Rome were Sabines. In 505 B.C. the Sabine Attius Clausus (= Appius Claudius Sabinus; *see* CLAUDIUS) settled in Rome with his followers. Thus there was a considerable Sabine infiltration into Rome. Nonetheless, the view that the Sabines conquered Rome in the first half of the 5th century is improbable; rather, the Romans had to fight many skirmishes with the Sabines before their final victory in 449. For a century and a half thereafter relations may have been friendly, but nothing is known until in 290 the Sabines were conquered by Curius Dentatus and were granted *civitas sine suffragio;* in 268 they received full Roman citizenship and ceased to be a separate people. They were quickly romanized. Their towns were administered by annual boards of *octoviri.*

The Sabines probably spoke Oscan. Of their language as distinct from that of the Latins no memorial has survived, but there are a large number of single words attributed to them by Latin writers—*e.g., fircus* (Lat. *hircus*, "he-goat"), *ausum* (*aurum*, "gold"), Pompilius (the Latin name Quinctilius)—which indicate clearly certain peculiarities in Sabine phonology, among them the change of Indo-European q^u to *p*. The tradition that the Sabines were the parent stock of the Samnites (*q.v.*) is confirmed by the name which the Samnites apparently used for themselves, which, with a latinized ending, would be Safini. By the time of the Roman scholar Varro (mid-1st century B.C.), who never refers to the language of the Sabines as a living speech, their speech had become latinized, although Varro does imply that the dialect used in their district differed somewhat from urban Latin. *See* also ITALIC DIALECTS; OSCAN.

SABINIAN (d. 606), pope from 604 to 606, was of Tuscan origin. Little is known of his life and pontificate. Under Pope Gregory the Great he served in the important post of papal apocrisiary (legate) at Constantinople. As Gregory's successor, elected in 604, he seems to have been markedly more conservative than his predecessor. This, together with his cautious admin-

istration of the papal granaries during a winter famine, probably explains the later untrustworthy legend of his stinginess, which is moreover refuted by the praise of his generosity in his epitaph. It is uncertain modern conjecture that because of his unpopularity disorders threatened to erupt at his funeral in 606. (JN. SR.)

SABLE, one of the weasel family, *Martes zibellina,* highly valued for its fine fur. The common name is sometimes also applied to the closely related American marten. The sable is native to the forests of northern Asia, from the Ural Mountains eastward and south to about latitude 45° N. It ranges from about 14 to 20 in. long, including the 5- to 7-in. tail. The body colour varies from brown to almost black, with a throat patch from dusky to salmon.

The sable is solitary and arboreal in habits, feeding on squirrels and other rodents, birds, eggs, insects, and other small animals. Mating occurs from June to August; gestation lasts from 249 to 299 days (implantation of the early embryo being delayed as in certain other weasels). The litter numbers from 1 to 4 kits. (J. N. L.)

SABLE ANTELOPE, a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes (*q.v.*), but distinguished by the stout, thickly ringed horns (present in both sexes) rising vertically from a ridge over the eyes and then sweeping backward in a bold curve. Sable antelopes are endowed with great speed and staying power. They are commonly met with in herds including from 10 to 20 individuals. Forest-clad highlands are their favourite resorts. *See* also ANTELOPE.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 mi. SE of Cape Canso. Composed of shifting sand, it is the exposed portion of a 50 mi. long, gently curved bar. The island itself is about 20 mi. long and 1 mi. wide, and the sand hills shaped by the wind rise to elevations up to 100 ft. It is reported to be moving slowly eastward, owing to the encroachment of the sea on the western end and the continual sand accumulation at the eastern end. The smooth coast line is without a harbour. Vegetation consists of grasses and other plants but no trees. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued. During the frequent fogs and storms this slender ribbon of land is virtually indistinguishable until close at hand. The danger of shipwreck has been minimized, however, by the Canadian government's maintenance of several lighthouses and lifesaving stations. (C. N. F.)

SABOTAGE, originally a designation for labour protest that took the form of action to impair the profitable operation of the employer's business; it acquired a broadened meaning during the first half of the 20th century when the tactics of social revolution and of conventional military conflict became closely intertwined. By legend, the term is derived from the action of an aggrieved French worker who clogged machinery with his wooden shoe (*sabot*), but the modern conception of sabotage traces from the French railway strike of 1910 when workers cut wooden "shoes" (*sabots*) that held the rails in place. From 1912 to 1918 the U.S. branch of the Industrial Workers of the World (IWW) officially approved sabotage for the purpose stated by Elizabeth Gurley Flynn in her *Sabotage* (1915): not physical violence but slowing down of work so that output would be deceptively yet effectively diminished in quantity and quality. The IWW's sanction of sabotage as a means of protest reflected the casual migratory worker's lack of reserve funds and the ease with which he could be replaced by the employer. These factors made difficult the use of formally organized strikes and the application of conventional economic pressure. The anti-war stand taken in 1914 by the American IWW and world syndicalists generally gave "sabotage" a mingled social and military meaning. In the Spanish Civil War of the late 1930s, social and military aspects of sabotage took on organized form as the concept of "the fifth column" emerged when Gen. Francisco Franco's supporters used sabotage among other means of damaging the government's Loyalist forces; at the same time, trained cadres of infiltrators into Franco's ranks and territories held by him harassed his troops. By the advent of World War II the stage had been set for the militarily disciplined use of sabotage in planned support of regular armed forces.

Although sabotage was attempted by the Axis powers no less than by the Allies, the latter had a stronger foundation for their efforts in the resistance movements of the occupied nations. The pressures of occupation overshadowed the differences between socio-economic classes, with the result that the military rather than the social-revolutionary aspect of sabotage came to the fore. The airdrop of liaison officers and demolition supplies, combined with long-distance radio communication, enabled the Allies to provide effective assistance to the liberation fighters. Sabotage was generally carried out by experts with professional skill. Though the emotionally or romantically dedicated partisan sporadically engaged in sabotage, and persons having property to lose practised sabotage cautiously, it was the trained and disciplined resistance member who had the major effect.

The term "sabotage" is sometimes loosely used to apply to any act of willfully injuring, destroying, contaminating, or infecting goods or services, or producing them defectively; the term has even been applied to wasteful, restrictive, and speculative business practices. However, since World War II it is generally understood as meaning a tactic of modern unconventional warfare.

SABRATHA (SABRATA), the westernmost of the three cities of ancient Tripolis, near the site of which lies the modern town of Sabratha (Arab. Sabratah), some 48 mi. W of Tripoli, in Libya. Founded by the Carthaginians as a seasonal trading post, it was first permanently settled in the 4th century B.C. Lying along an inhospitable coastline, it possessed a modest natural harbour, later improved by the Romans, and together with Oea (Tripoli) it served as an outlet for the trans-Saharan caravan route through Ghadames (Ghudamis). After a period of quasi-independence following the fall of Carthage in 146 B.C., it passed under Roman rule, enjoying a considerable prosperity, which reached its peak in the late 2nd century A.D. Rebuilt after a disastrous sack by the Austuriani *c.* A.D. 365, it declined rapidly in the 5th century under Vandal misrule. The revival that followed the Byzantine reconquest (534) was on a greatly reduced scale, and soon after the Arab conquest (643) the city ceased to exist.

Excavation has uncovered more than half the area of the ancient city, including the forum area, many of the harbourside installations, and a large 2nd-century residential quarter adjoining the theatre, the stage building of which has been restored to the full height of its three classical orders. The forum occupies the site of an open space within the late Punic city, and its buildings, which include the civil basilica, the capitolium and four other temples, and the meeting place of the local senate (*curia*), had a long and complex evolution. Other Roman buildings include baths, temples (of Hercules, Isis, and Sarapis), fountains, and private buildings; there are many mosaics. Christian remains include a catacomb and four churches, one of them with a magnificent Justinianic mosaic, and the Byzantine walls. Flavia Domitilla, wife of Vespasian, came from Sabratha, and it was there that Lucius Apuleius (*q.v.*) stood trial for witchcraft.

See D. E. L. Haynes, *The Antiquities of Tripolitania* (1955); J. M. Reynolds and J. B. Ward-Perkins (eds.), *Inscriptions of Roman Tripolitania* (1952). (J. B. W.-P.)

SABRE FENCING: *see* FENCING.

SABRE-TOOTHED TIGER, an extinct subfamily, Machairodontinae, of the cat family, Felidae. The most characteristic feature, the basis of the name, is the pair of elongated, blade-like canine teeth in the upper jaw. The subfamily ranges in age from the Oligocene epoch, 30,000,000 to 35,000,000 years ago, to the Pleistocene, with final extinction not more than a few thousand years in the past. Well known as this subfamily is, there remain unresolved differences of opinion about its relationships to other felids and indeed differences as to the placement of some

Oligocene and Miocene genera as sabretooths, false sabretooths (nimravines), or true cats (felines). In this article only the animals that can be placed without serious question among true sabre-toothed tigers (Machairodontinae) are considered.

The best-known genus of the subfamily is *Smilodon* of the Pleistocene of North and South America. This was a large, massive, short-limbed carnivore with immense canine teeth. These teeth appear to have been used for stabbing and slashing attacks upon the large, thick-skinned herbivores that formed the chief prey of the sabretooths. The skull was notably modified in adaptation to this type of feeding. The occipital region was high and the ventral mastoid processes long, in accommodation of strong neck muscles. The lower jaw was formed in such a way that it could be widely opened, thus freeing the dagger-like canines for action. Molar teeth were shearing blades, with no vestiges of grinding surfaces. Among living cats, only the lion approaches *Smilodon* in massiveness, and even the largest lions do not reach the proportions of the largest sabretooths.

BY COURTESY OF CHICAGO NATURAL HISTORY MUSEUM, FROM A MURAL BY CHARLES R. KNIGHT

RESTORATION DRAWING OF EXTINCT SABRE-TOOTHED TIGER

The basic sabretooth characters were present, but less fully developed, in *Hoplophoneus*, a moderate sized Oligocene ancestor of *Smilodon*. Other early members of the family Felidae, such as *Dinictis* of the Oligocene, also had fairly well-developed sabre-like teeth but for the most part lacked the other specializations seen in the true sabretooths. Such forms have been variously classified as true cats or as false sabretooths.

Throughout the Miocene and Pliocene epochs of the Tertiary, machairodonts were present in North America and Europe, although, as for most carnivores, their remains are relatively rare. By Pliocene times they had spread to Asia and Africa, and in the Pleistocene were present in South America. The pattern of extinction of the sabre-toothed cats follows closely the pattern of extinction of the mastodons, which appear to have been one of their principal sources of food. As these large, elephantlike animals became reduced and extinct in the late Pliocene of the old world, the sabre-toothed cats died out and are not found in the Pleistocene. In North and South America, where mastodons persisted through the Pleistocene, sabre-toothed tigers continued successfully to the end of that epoch. The best-known occurrence of *Smilodon* is in the tar pits of Rancho La Brea, in Los Angeles, Calif., where many individuals were trapped in the tar, apparently as they preyed upon large herbivores that also had become bogged. The tar deposits have preserved a wealth of bones virtually unaltered since the deaths of the animals. (E. C. O.)

SABZEVAR, the chief town of a *shahrestan* (district) in Khurasan, Iran, lies in a desertlike plain at an elevation of 2,930 ft. (893 m.), about 120 mi. (190 km.) W of Meshed on the main road to Teheran. Pop. (1964 est.) 43,522. The town is of ancient origin and is linked by legend with the fight between Rustam (founder-hero in Persian mythology) and Suhrab (his son). During several periods Sabzevar was the seat of semi-independent princes. It was destroyed by the Mongols, but it revived and was later strengthened by the Safawid rulers.

Sabzevar is the centre of an extended agricultural *shahrestan* which produces grain and cotton by irrigation. There are copper and borax deposits. (H. Bo.)

SÁ-CARNEIRO, MÁRIO DE (1890–1916), Portuguese poet and novelist of the so-called modernist generation and one of the most original and complex figures in Portuguese literature in the first half of the 20th century, was born in Lisbon on May 19, 1890. After leaving the secondary school there, he went to Paris where he studied for a year (1912–13) in the law faculty at the Sorbonne. Before leaving Lisbon he had made the acquaintance of Fernando Pessoa, the greatest literary figure of the generation, and maintained a regular correspondence with him while he was in France. Sá-Carneiro's first literary production was the play *Amizade* written in collaboration with a fellow-pupil while he was still at school. In 1912 he published *Princípio*, a collection of prose tales. His first poems were written in Paris in 1914 and were published in the same year under the title *Dispersão*. In 1914 also he published the novel *A Confissão de Lúcio* and, back in Portugal, he launched the review *Orpheu* in 1915 in collaboration with Fernando Pessoa and other young men of the modernist group. The same year saw also the appearance of his collection of short stories, *Céu em Fogo*. Having returned to Paris, he suffered a moral and financial crisis, abandoned his studies, quarreled with his father, and gave himself up to the life of a literary Bohemian. The crisis came to a head in 1916 when the poet, the victim of a sensibility which left him facing life disarmed—"without support" as he himself put it—committed suicide in the Hotel de Nice in Paris on April 26. Before his death he had sent his unpublished poems to Pessoa, and these appeared in 1937 under the title *Indicios de Oiro*. His *Poesias* were edited, with a preface, by J. Gaspar Simões in 1946.

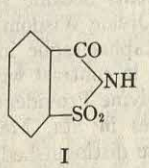
See A. Casais Monteiro, "Mário de Sá-Carneiro," in *Considerações Pessoais* (1933); J. Gaspar Simões, *Historia da Poesia Portuguesa do Seculo xx* (1959). (J. G. Ss.)

SACASA, JUAN BAUTISTA (1874–1946), president of Nicaragua from 1932 through 1936, was largely overshadowed by two of his nominal subordinates, César Augusto Sandino and Anastasio Somoza. Born in León, Nic., on Dec. 21, 1874, Sacasa studied in the United States from 1889 to 1901, earning an M.D. from Columbia University. As leader of the Liberal Party he was elected vice-president in 1924 on a coalition ticket with Carlos Solórzano of the Conservative Party. However, Sacasa was forced into exile the following year by a *coup d'état* which installed Gen. Emiliano Chamorro Vargas as president. When Chamorro was replaced by Adolfo Díaz, Sacasa returned to Nicaragua and asserted his claim to the presidency. The resulting unrest caused the U.S. government to send Marines to Nicaragua to maintain order, and with their arrival Sacasa (in April 1927) reluctantly accepted a compromise imposed by U.S. Special Commissioner Henry L. Stimson. Elected president in 1932, Sacasa was ousted on June 6, 1936, by his nephew and military commander, Gen. Anastasio Somoza, who coveted the presidency for himself. Sacasa died in Los Angeles, Calif., on April 17, 1946. (R. M. Sc.)

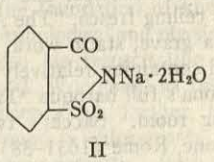
SACATEPÉQUEZ, a department in the highlands of central Guatemala, just west of Guatemala City. Area 179 sq.mi. Pop. (1964) 80,479. Its capital is Antigua, pop. (1964) 21,984, former capital of Guatemala. The department is a part of the chief coffee-producing area of the country. Other crops include corn (maize), beans, and hay. Much land is used for the grazing of beef cattle. The department is served by the Inter-American Highway and by several all-weather feeder roads. Antigua was abandoned as the national capital because of frequent earthquakes. (P. E. J.)

SACCHARIN is a name applied to several organic substances used as sweetening agents. The saccharin of commerce is derived from toluene. Commercial saccharin is marketed as insoluble saccharin (I—the imide of ortho-sulfobenzoic acid) and as soluble saccharin (II—the sodium salt of the former substance).

For consumer use, pharmaceutical manufacturers prepare tiny pellets containing $\frac{1}{4}$, $\frac{1}{2}$, or 1 gr. of pure saccharin. The pellets may contain the saccharin in the form of the soluble sodium salt or in the acid form combined with sodium bicarbonate which converts



I



II

the acid to the sodium salt upon dissolving. The sweetening power of the commercial powder is estimated at 425 times the sweetening power of ordinary sugar; the commercial crystals, which contain some water of crystallization, are estimated to have a sweetening power 375 times that of sugar. A one-quarter grain pellet has

roughly the same sweetening power as a level teaspoon of sugar. Saccharin has no food value at all. It is used in the diets of diabetics and other persons who must avoid excessive sugar intake and also in the preparation of dietetic foods, dentifrices, mouthwashes, and cosmetics, and for sweetening tobacco and medicinal preparations, particularly where the presence of sugar might lead to spoilage by fermentation or mold growth. Saccharin is not metabolized; it is excreted unchanged from the body in the urine.

Saccharin was discovered by Ira Remsen and C. Fahlberg in 1879 in the course of investigations at the Johns Hopkins University on the oxidation *o*-toluene-sulfonamide. Fahlberg noticed an unaccountable sweet taste to his food and found that this sweetness was present on his hands and arms, despite his having washed thoroughly after leaving the laboratory. Checking over his laboratory apparatus by taste tests, Fahlberg was led to the discovery of the source of this sweetness—saccharin.

Saccharin is made by treating toluene with chlorosulfonic acid. The reaction produces ortho- and para-toluene sulfonylchlorides. The two products are separated and the ortho-toluene sulfonylchloride is treated with ammonia to form the amide. The amide is then oxidized to saccharin.

See T. E. Thorpe, *Dictionary of Applied Chemistry*, 4th ed., vol. x (1950). (F. D. Sh.; X.)

SACCHETTI, FRANCO (*c.* 1330–1400), Italian poet and novelist whose work is typical of late 14th-century Florentine literature, was born in Ragusa of a noble Florentine family. Both as merchant and as *podestà* he traveled widely, thus acquiring an experience of life which compensated for his lack of a regular education. In his letters, in some of his verses and in the *Sposizioni di Vangeli* he expressed his political and moral views. Although poetry was not his main interest, some of his poems, written to be set to music, are among the best of 14th-century minor poetry. As a novelist he wrote 300 stories of which only 223 are known: they consist mainly of anecdotes and jokes derived from oral tradition and the author's direct observation of life. Their artistic value is to be found in the colourful and vivid description of people and places, and their best passages depict scenes from everyday life. Sacchetti does not convey the substance of human life, but only its external appearance.

Bibliography.—The best modern editions of Sacchetti's works are *Il libro delle Rime* (1936) and *Battaglia, Lettere, Sposizioni* (1938), both ed. by A. Chiari; *Il Trecentonovelle*, ed. by V. Pernicone (1946). *See* also E. Li Gotti, *F. Sacchetti* (1940); L. Caretti, *Saggio sul Sacchetti* (1951). (G. A.)

SACCHI, ANDREA (1599–1661), Italian painter, was the chief representative of the classical current in Roman mid-17th-century painting (Nicolas Poussin, being a Frenchman, belonging in a sense apart) and as such he stood in opposition to the full baroque. He was born at Nettuno, 30 mi. S. of Rome, but trained under Francesco Albani at Bologna. After returning to Rome in 1621 he worked there till his death (June 21, 1661), except for short visits to north Italy after 1635 and to Paris in 1640.

His Bolognese training gave him an initial bias toward classicism and a taste for colour. But the direct influence of Raphael is already added to these qualities in the "Miracle of St. Gregory" of 1625–27 (chapter house, St. Peter's). This work brought Sacchi to the notice of the Sacchetti family, who employed him, with Pietro da Cortona, in the decoration of their villa at Castel Fusano in 1627–29. Both artists were next taken on by Antonio Cardinal Barberini to decorate the Barberini palace in Rome, and it was then that the classical and baroque currents became separated. Sacchi's ceiling fresco, "The Allegory of Divine Wisdom" (1629–33), is a grave, static work, markedly Raphaelesque in conception and containing relatively few figures, in contrast with Pietro da Cortona's full baroque "Triumph of Divine Providence" in an adjoining room. Sacchi's two altarpieces in Sta. Maria della Concezione, Rome (1631–38), are likewise distinguished by their classicism from the other pictures in the church.

His most important work after the "Divine Wisdom" is the series of eight canvases illustrating the life of St. John the Baptist in the cupola of S. Giovanni in Fonte, Rome (1639–45). He painted a few portraits but concentrated mainly on religious works. (M. W. L. K.)

SACCHINI, ANTONIO MARIA GASPARO GIOACCHINO (1730–1786), Italian composer of operas, one of the most gifted of the Neapolitan school, was born at Florence on June 14, 1730. He studied at the Santa Maria Conservatory, Naples. In the late 1750s he began to compose operas, chiefly on librettos by P. Metastasio. *Alessandro nell'Indie*, produced at Venice in 1763, and *Lucio Vero* in 1764, were followed by further operas. In 1769 he became music director of the Conservatorio dell' Ospedaletto at Venice. Later he traveled in Germany, and in 1772 went to London where he produced (1773) *Il Cid* (given earlier in Rome and Lisbon as *Il gran Cidde*) and (1774) *Perseo*. From about 1783 he was in Paris. His masterpiece, *Oedipe à Colone*, was first performed at Versailles in January 1786, and for many years remained a favourite work on the Parisian stage. He died in Paris on Oct. 6, 1786.

Sacchini was particularly admired for his operas in the serious manner. They were remarkable for their broad melodies, anticipating certain lyrical features of 19th-century music. Some of his later works show the influence of Gluck. He also wrote oratorios, motets, and instrumental works including sonatas for harpsichord and violin, trios, and quartets that were published in London, Paris, and Amsterdam. (Cs. Ch.)

SACCO-VANZETTI CASE, a murder trial in Massachusetts, extending over seven years, 1920–27, and resulting in the execution of the defendants, Nicola Sacco and Bartolomeo Vanzetti. The trial resulted from the murders in South Braintree, Mass., on April 15, 1920, of F. A. Parmenter, paymaster of a shoe factory, and Alessandro Berardelli, the guard accompanying him, in order to secure the payroll they were carrying. On May 5 Sacco and Vanzetti, two Italians who had immigrated to the United States in 1908, one a shoe worker and the other a fish peddler, were arrested for the crime. On May 31, 1921, they were brought to trial before Judge Webster Thayer of the Massachusetts Superior Court, and on July 14 both were found guilty by verdict of the jury. Socialists and radicals protested the men's innocence. Many people felt that there was less than a fair trial and that the defendants were convicted for their radical, anarchist beliefs rather than for the crime for which they were tried. All attempts for retrial on the ground of false identification failed. On Nov. 18, 1925, one Celestino Madeiros, then under a sentence for murder, confessed that he had participated in the crime with the Joe Morelli gang. The state supreme court refused to upset the verdict, since at that time the trial judge had the final power to reopen on the ground of additional evidence. The two men were sentenced to death on April 9, 1927.

A storm of protest arose with mass meetings throughout the world. Gov. A. T. Fuller appointed an independent investigatory committee of Pres. A. Lawrence Lowell of Harvard University, Pres. Samuel W. Stratton of the Massachusetts Institute of Technology, and Robert Grant, a former judge. On Aug. 3, 1927, the governor refused to exercise his power of clemency; his advisory committee agreed with this stand. Demonstrations proceeded in many cities throughout the world and bombs were set off in New York and Philadelphia. The men, maintaining their innocence, were executed Aug. 23, 1927. Sacco-Vanzetti agitation continued and as late as April 1959, a legislative committee sat in Boston giving a full day for hearing on a proposal by Rep. Alexander J. Cella to the legislature to recommend to the present governor a retroactive pardon. The committee and the legislature declined to take such a step. Evidence was offered at the hearings, however, by correspondence and otherwise pointing to the guilt of Morelli and his gang. The entire record of the case has been preserved in printed form with a foreword written by a group of the leading attorneys of the nation.

(1954); Herbert B. Ehrmann, one of the attorneys for the defendants, *The Untried Case; The Sacco-Vanzetti Case and the Morelli Gang* (1933); R. P. Weeks (ed.), *Commonwealth v. Sacco and Vanzetti* (1958). (M. L. E.)

SACHEVERELL, HENRY (1674–1724), English political preacher, impeached by the Whig junto for his inflammatory sermons in the high church Tory interest, was a son of Joshua

Sacheverell, rector of St. Peter's, Marlborough, Wiltshire. He entered Magdalen College, Oxford, in 1689. Sacheverell took his degrees in arts and divinity, and became bursar in 1709. From the beginning (1702) of Anne's reign he obtained great notoriety as a high church scourge of Whigs, Dissenters, and Latitudinarians, and was known as the author of a violent pamphlet entitled *The Character of a Low Churchman* (1701) in which he denounced any political or doctrinal concessions to Nonconformists. In December 1705 he preached before the University of Oxford a sermon on the perils among false brethren, in which he attacked Whigs, Dissenters, and moderate Tories. This sermon passed without public notice, but he reproduced the substance at St. Paul's before the lord mayor on Nov. 5, 1709, assailing the Whig ministers as "wily Volpones," using the current nickname (taken from Ben Jonson's comedy *Volpone, or the Fox*) of the earl of Godolphin, lord treasurer. Godolphin, who had long been smarting under clerical attacks, demanded satisfaction; the extremer members of the Whig junto wanted to end Tory sniping from the pulpit before the election due in 1710, and Sacheverell was impeached. The result was calamitous for the government. There was a deluge of pamphlets. The London mob rioted wildly in sympathy with Sacheverell. Dissenting meetinghouses were wrecked and troops were called out. The trial was a public spectacle. The preacher was condemned by only 69 votes to 52, and was sentenced merely to three years suspension from preaching. This was as good as a Tory victory. Sacheverell's journeys to and fro were like royal progresses, and the enthusiasm encouraged Anne to dismiss Godolphin and the Whigs before the next election.

Sacheverell was despised even by those who took advantage of his notoriety, but when his sentence expired, he was presented (1713) by the queen to the valuable living of St. Andrew's, Holborn, in London. In 1716 he married a rich widow. He quarreled on various occasions with his parishioners. He died at Highgate on June 5, 1724, and was buried in St. Andrew's, Holborn. In 1747 the sexton of that church was imprisoned for stealing his lead coffin.

See A. T. Scudi, *The Sacheverell Affair* (1939); Falconer Madan, *A Bibliography of Dr. Henry Sacheverell* (1884). (W. R. Wd.)

SACHEVERELL, WILLIAM (1638–1691), English Whig politician, orator, and prominent opponent of the succession to the throne of James, duke of York (later James II), came from an ancient and prosperous landed family. Elected to Parliament for Derbyshire in 1670, he at once embarked on an intensely political career. His efforts were directed mainly against French and Roman Catholic influence at the court of Charles II. In 1673 he helped to inspire the first Test Act, whereby holders of office had to take Anglican Communion, and in 1678 pressed the investigation of the "Popish Plot" (*see* Oates, Titus) and moved the first bill to exclude the duke of York from the succession. Although he never compromised over the succession, he withdrew from national politics at the height of the exclusion crisis in 1681.

He played no direct part in the Revolution of 1688, but sat for Heytesbury in Wiltshire in the Convention Parliament, which welcomed William III in 1689. His lifelong interest in the Navy was then rewarded with a place as a lord of the Admiralty, but he still proved troublesome to the court. In the drafting of a corporation bill he was responsible for a clause (which bears his name) designed to prevent the Tories from controlling the elections, which was so repugnant to William that he dissolved Parliament (February 1690). Sacheverell was returned for Nottinghamshire for the new Parliament, but died at his seat at Barton, Nottinghamshire, on Oct. 9, 1691. He was one of the most notable orators of his time, and about 400 of his speeches are recorded in A. Grey, *Debates of the House of Commons from . . . 1667 to . . . 1694*, ten volumes (1769). (H. G. Ro.)

SACHS, HANS (1494–1576), the most prolific German poet and dramatist in the 16th century, born in Nürnberg, Nov. 5, 1494, son of a tailor, was educated at the Latin school and apprenticed in 1509 to a shoemaker. Lienhard Nunnenbeck, a weaver, taught him the art of the Meistersinger (*q.v.*). As a journeyman (1511–16) he visited most of south and central Germany, making contact everywhere with Meistersinger guilds. In 1517 he became a master in the Nürnberg *Singschule* and in 1519, when he married, a master shoemaker. *Die Wittembergisch Nachtigall* (1523), a verse allegory supporting Luther, made him famous. Other Protestant writings followed, until in 1527 the Nürnberg council forbade further publications. Thereafter his life was devoted to his trade and especially his poetry. He died in Nürnberg, Jan. 19, 1576.

Besides 13 *Meisterlied* tunes and seven prose dialogues, Sachs wrote more than 6,000 poems, including some 200 dramas. His subject matter comes from the Bible, Greek, Latin and Italian literature (in translation), Germanic legend, courtly romances and collections of anecdotes, historical events and daily life. But everything is reduced to a common level of thought and language; his characters are essentially contemporary Nürnberg citizens. Subjects are used with little concern for their appropriateness to a particular genre; indeed Sachs's guiding principles are moral and didactic rather than aesthetic.

Sachs is regarded—especially since Wagner's *Meistersinger von Nürnberg*—as the greatest of the Meistersingers. His compositions (over 4,000 *Meisterlieder*) certainly contributed to Nürnberg's pre-eminence in Meistergesang; but his popularity rests on other foundations, for Meistergesang was not a popular art. Again, his tragedies and comedies, long-winded and formless, are simple stories in dialogue form, divided arbitrarily into acts in imitation of the humanists; they have only historical interest. His best and most popular works are his short, humorous narrative poems—*Sankt Peter mit der Geiss* (1555), *Das Kälberbrüten* (1557), *Der Müller mit dem Studenten* (1559)—and his *Fastnachtspiele,* some of which are still performed—*Der farend Schüler im Paradeis* (1550), *Der bös Rauch* (1557), *Das heiss Eisen* (1551) and *Der Rossdieb zu Fünsing* (1553). His work, though it has been overpraised, reflects a common sense, realistic attitude to life, a strong moral sense, a deep—but tolerant—attachment to Protestant Christianity, and a sometimes uproarious but always kindly humour.

Bibliography.—*Werke* (without *Meisterlieder*, but with full bibliography), ed. by A. von Keller and E. Goetze, 26 vol. (1870–1908); *Sämtliche Fastnachtsspiele,* ed. by E. Goetze, 7 vol. (1880–87); *Sämtliche Fabeln und Schwänke,* ed. by E. Goetze and K. Drescher, 6 vol. (1893–1913), vol. 1, 2nd ed. (1953). Selections (in modern spelling) by P. Merker and R. Buchwald, 2 vol., 2nd ed. (1923–24). *See* also E. Goetze, *H. Sachs* (1890); R. Genée, *H. Sachs und seine Zeit,* 2nd ed. (1902); H. Cattanès, *Les "Fastnachtsspiele" de H. Sachs* (1923); W. Stammler, *Von der Mystik zum Barock,* 2nd ed. (1950); E. Geiger, *Der Meistergesang des H. Sachs* (1956). (J. R. We.)

SACHS, JULIUS VON (1832–1897), German botanist and outstanding plant physiologist, was born at Breslau (Wroclaw) on Oct. 2, 1832. On leaving school in 1851 he became assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and established himself as *Privatdozent* (official but unpaid lecturer) for plant physiology in the University of Prague. In 1859 he was appointed physiological assistant to the Agricultural academy of Tharandt in Saxony, and in 1861 he went to the Agricultural academy at Poppelsdorf, near Bonn. He remained there until 1867, when he was nominated professor of botany in the University of Freiburg im Breisgau. In 1868 he accepted the chair of botany in the University of Würzburg, which he continued to occupy until his death on May 29, 1897.

Sachs was especially associated with the development of plant physiology which marked the latter half of the 19th century, though he contributed to every branch of botany. His earlier papers, in botanical journals and publications of learned societies, are of interest. Prominent among them is the series of "Keimungsgeschichten," which laid the foundation of knowledge of microchemical methods and the morphological and physiological details of germination. There is also his resuscitation of the method of water culture first used by J. Woodward in 1699, and its application to problems of nutrition; and, further, his discovery that the starch grains to be found in chloroplasts are the first visible product of their assimilatory activity. Sachs's later papers were published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg* (1871–88). Among these are his investigation of the periodicity of growth in length; his researches on heliotropism and geotropism, in which he introduced

the "clinostat"; his work on the structure and arrangement of cells in growing points; the evidence upon which he based his imbibition theory of the transpiration current; and his studies of the assimilatory activity of the green leaf. Sachs was a great teacher, and botanists from all over the world worked in his laboratory. He had a great influence on British and American botany at the time when there was a swing over from purely systematic studies, an influence to which the English translations of his textbooks contributed.

Sachs's works are: *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French ed., 1868); *Lehrbuch der Botanik* (1868; Eng. ed., 1875 and 1882), a comprehensive work, giving a summary of the botanical science of the period, including the results of original investigations; *Vorlesungen über Pflanzenphysiologie* (1882; 2nd ed., 1887; Eng. ed., 1887); *Geschichte der Botanik* (1875; Eng. ed., 1890).

See E. G. Pringsheim, *Julius Sachs* (1932).

SACKVILLE, GEORGE SACKVILLE (afterward **GERMAIN**), 1st Viscount (1716–1785), English soldier, dismissed from the service for failing to obey orders at the Battle of Minden, and the politician partly responsible for the British surrender at Saratoga, was the third son of the 1st duke of Dorset. Born in London on Jan. 26, 1716, he was educated at Westminster School (1723–31) and at Trinity College, Dublin (1731–34, his father being then chief governor of Ireland). Commissioned in 1737, he distinguished himself in the War of the Austrian Succession, particularly at the Battle of Fontenoy (May 1745) where he led his regiment, the 28th Foot, so deep into the French ranks that he was taken prisoner and his wounds were treated in Louis XV's own tent. Later, as colonel of the 20th Foot, he served in Scotland and Ireland and was highly esteemed by all his officers, including James Wolfe. Sackville then transferred to the cavalry as colonel, first of the 12th and then of the 6th Dragoon Guards. Promoted major-general (1755), he was a member of the committee of enquiry which condemned the conduct of the Rochefort expedition of 1757. The attack on Saint-Malo in 1758, in which Sackville himself held high command, was equally mismanaged and unsuccessful. A British contingent, commanded after October 1758 by Sackville, was then sent to Germany as part of the allied army under Prince Ferdinand of Brunswick (*see* Seven Years' War). At the Battle of Minden (August 1759), after the British infantry had shattered the cavalry forming the French centre, he inexplicably failed to obey repeated orders from the prince to exploit the success, and the enemy retreated unpursued. A court martial declared him "unfit to serve his majesty in any military capacity whatsoever," and his name was struck off the rolls of the privy council (1760), to which, however, it was restored in 1765.

In 1770, under the terms of a will by which he inherited the estate of Drayton, Northamptonshire, he assumed the name of Germain. As colonial secretary (1775) under Lord North, he was the minister responsible for the general conduct of the war against the American colonists, and as such was largely but not solely to blame for the failure to coordinate operations from Canada and New York against New England which led to the surrender of Gen. John Burgoyne's army at Saratoga (1777). Created Viscount Sackville of Drayton (February 1782), he retired from politics when North resigned (March 1782) and died at Stoneland Lodge (now Buckhurst Park), Withyham, Sussex, on Aug. 26, 1785. His elder son, Charles Sackville-Germain, succeeded his cousin as 5th duke of Dorset.

See F. E. Whitton, *Service Trials and Tragedies* (1930).

(E. W. Sh.)

SACKVILLE, THOMAS, 1st Earl of Dorset (1536?–1608), English statesman, poet, and dramatist, remembered largely for his share in two achievements of significance in the development of Elizabethan poetry and drama: the collection *A Mirror for Magistrates*, and the tragedy *Gorboduc*. He was born, probably at Buckhurst, Withyham, Sussex, almost certainly in 1536, the only son of Sir Richard Sackville, Anne Boleyn's cousin, who became under-treasurer of the exchequer and chancellor of the court of augmentations, and who established his family's fortunes by acquiring money and lands. Although Thomas Sackville is described as a member of Hart Hall, Oxford, and of St. John's College, Cambridge, he probably never studied at either university, though he received honorary degrees at Cambridge in 1571 and Oxford in 1591. In 1553 he settled in London, and in 1555 was admitted to the Inner Temple, becoming a barrister in 1558. He was elected to Parliament for Westmorland (1558), for East Grinstead, Sussex (1559), and for Aylesbury, Buckinghamshire (1563). In *c.* 1563 he went to Italy, returning on his father's death (April 21, 1566); he was invested with a knighthood and the title of baron of Buckhurst in June 1567.

On a mission to France in 1571, Sackville opened negotiations for a marriage between Elizabeth I and the duke of Anjou and in 1572 he was one of the peers who tried Thomas Howard, duke of Norfolk. He became a privy councilor in 1585, and in 1586 conveyed the sentence of death to Mary, queen of Scots. In March 1587 he went to The Hague to report on the situation after the earl of Leicester's expedition (1585–86) and to tell the states-general that the queen could no longer aid them in the war with Spain, but was recalled in disgrace in June when the queen decided to continue the war. On Leicester's death (September 1588), he was restored to favour, and in 1589 and 1598 was again sent to The Hague. He became chancellor of the University of Oxford in 1591, and in 1599 succeeded Lord Burghley as lord high treasurer, an appointment confirmed for life by James I in 1603. In March 1604 he was created earl of Dorset. Among estates he acquired in Kent and Sussex was Knole House, Sevenoaks, Kent, still occupied by his descendants: he rebuilt part of it during 1603–05. He died suddenly at the council table on April 19, 1608.

By his marriage (1555) to Cecily, daughter of Sir John Baker of Sissinghurst, Kent, he had three sons. Robert, the 2nd earl (1561–1609), was a member of Parliament (1585–1608) and a man of considerable learning; William (*c.* 1568–1591) was killed in the service of Henry IV of France; and Thomas (1571–1646) was also a soldier.

The works by which Sackville is chiefly remembered were written in the 1550s. It is likely that he began the *Complaint of Henry, Duke of Buckingham*, included in T. Marsh's 1563 edition of *A Mirror for Magistrates*, in 1554, although it did not appear in W. Baldwin's editions of 1555 (suppressed) and 1559. His *Induction*, also included in the 1563 edition, and, in the enlarged edition of 1610, transposed to the beginning of the work (thus making Sackville appear responsible for the whole collection), was also begun much earlier. *A Mirror for Magistrates*, published in 1563 as an addition to *The Fall of Princes* by John Lydgate (*q.v.*), takes the form of tragic lamentations by the ghosts of great men, contributed by various writers, and indicates the development of style and taste in the early Elizabethan age. Its material, according to the 1555 title page, had been "diligently collected out of the Chronicles," and it thus has a place in the fusion of poetry and history which later found expression in the work of Drayton, Daniel, Spenser, and Shakespeare. It includes pieces written soon after the death of James IV of Scotland (1513), metrical experiments similar to those in *Tottel's Miscellany* (1557), and early examples of the conceits and poetic passion characteristic of the later part of the Elizabethan period.

Of Sackville's contributions, the most notable is the *Induction*. Written in rime royal (*q.v.*), this describes the poet's visit to the infernal regions, led by Sorrow, who promises that he will see there the wretchedness of those ruined by ambition, and will recognize the transience of earthly pleasure. At hell's approaches, he encounters figures representing remorse, dread, revenge, misery, care, sleep, old age, malady, famine, death, and war. After crossing Acheron, he is surrounded by shades, and Sorrow indicates those "that whilom sat on top of Fortune's wheel," of whom Buckingham advances first; thus introducing the *Complaint*. Sackville has little feeling for drama, but the *Induction* allows him to develop his gift for allegorical description, in which he shows an energy and a stateliness of tone which directly anticipate Spenser. The stanzas describing "Heavy sleep, the cousin of death" are deservedly famous.

Sackville's other important literary work, written with Thomas

Norton (*q.v.*), was *The Tragedy of Gorboduc*, the earliest English drama in blank verse (*q.v.*). The unauthorized first edition (1565) credits Sackville with the last two acts. *Gorboduc* is broadly Senecan in character, the action being related by messengers, and the dialogue consisting almost entirely of long addresses with little dramatic quality. A dumb show precedes each of the five acts, and four "ancient and sage men of Britain" act as chorus. The plot, taken from the *Historia regum Britanniae* of Geoffrey of Monmouth (*q.v.*), concerns a legendary king of Britain, Gorboduc, whose sons, Ferrex and Porrex, quarrel when their aged father divides the kingdom between them. Ferrex is killed by his younger brother, and the queen, Widen, takes revenge by murdering Porrex. When Fergus, duke of Albany, tries to seize the kingdom, civil war breaks out and the play ends with a warning against the evil consequences of rebellion. As this suggests, *Gorboduc* is a moral *exemplum* rather than a piece of entertainment, offering no concessions of comic or romantic relief. After presentation at the Inner Temple at the 1560 Christmas revels, it was performed before the queen at Whitehall on Jan. 18, 1562. The 1565 edition was followed by an undated edition, *c.* 1571. (*See* also DRAMA: *Modern Drama: Neoclassic Imitation;* ENGLISH LITERATURE: *Elizabethan and Jacobean Drama.*)

In the address to his translation of Seneca's *Thyestes* (1560), Jasper Heywood mentions "Sackvylde's Sonnets, sweetly sauste." Of these only the poem prefixed to Hoby's translation (1561) of Castiglione's *Il Cortegiano* is known.

According to Sackville's funeral sermon (Westminster Abbey, May 26, 1608), by his chaplain, George Abbot, later archbishop of Canterbury, Elizabeth I shared the general high opinion of Sackville's merits as a writer.

SACRAMENT, in Christian theology, has been defined as "the visible form of an invisible grace" (Augustine). This definition underlies most Western definitions, both Roman Catholic and Protestant, including those of the Council of Trent, the Book of Common Prayer, the Lutheran Book of Concord, and many of the Reformed confessions; it would also be acceptable to Eastern Orthodox theologians.

Despite efforts to find a general "sacramental principle" in the Christian doctrines of creation and incarnation, the meaning of "sacrament" must be worked out *a posteriori.* According to the New Testament, Jesus instituted and commanded various practices, among them baptism, a common meal, the washing of feet, anointing, and the casting out of demons. Some of these were continued by Christians; some were dropped; still others were adopted and attributed to the institution of Christ. Consideration of all these rites and ordinances led to the development of the concept "sacrament," but both the definition and the exact number remained fluid well beyond the end of the 1st millennium of church history. As finally set forth by Peter Lombard, codified by Thomas Aquinas, and promulgated by the Council of Trent, the sacraments were said to be seven in number (baptism, confirmation, Eucharist, penance, anointing or extreme unction, holy orders or ordination, and matrimony) and to be efficacious signs of the grace of God instituted by Christ for permanent observance by the church. The Reformation questioned both the definition and the number of sacraments in scholastic theology, as well as the use of the sacraments in medieval piety, liturgy, and churchmanship.

Specific information about the theological, biblical, historical, and liturgical aspects of each of the "sacraments" is presented in the several articles dealing with them. Nevertheless, the importance of the general concept in Christian language requires that attention be given here to at least two issues in the sacramental theology of the various Christian traditions and denominations.

Sacraments as Signs.—Everyone would agree that a sacrament involves the use of external means or signs, which scholastic theology calls the "matter" of the sacrament: a physical element and the action of using that element. Theologians in the Platonic tradition, for all of whom the entire external world of things is a "sign" or "symbol" of the spiritual world and for some of whom it is nothing more than that, have very little difficulty regarding baptism, Eucharist, etc., as signs of the efficacious presence of God; they have more difficulty extricating these signs from the welter of symbols all about them. For quite different reasons, radical Protestants, who object to traditional ideas of the sacraments as a means of grace, also face the issue of finding a qualitative distinction between the sacraments and other signs, as, for example, the cross. The Council of Trent proclaimed that "the sacraments of the New Testament contain the grace that they signify" and are not "merely outward signs . . . and some sort of marks of the Christian profession"; this seems to underemphasize the role of the sacraments as signs of the personal reality of the presence of grace in the recipient.

Nevertheless, the vigorous efforts of the proponents of each of these traditions to meet the objections mentioned are themselves worthy of note. Augustine transcended his Neoplatonic propensities to develop a theory of signs and sacraments; even very radical Protestants treat baptism and the Eucharist with utmost seriousness; much of the history of Roman Catholic sacramental theology since Trent has been marked by the combination of the traditional stress upon the sacraments as means of grace with a further clarification of the difference between this stress and any "magical" interpretation of the effect of the sacraments. The differences among Christians on this issue remain profound and in many ways basic; no less significant, however, is the *rapprochement* between the Protestants who seek to avoid the rationalism of a theory of "mere symbols" and the Roman Catholics who seek to avoid the superstition of a theory of "efficacity apart from the disposition of the recipient."

Sacraments as Institutions of Christ.—Part of almost every definition of a sacrament is the requirement that it have been, in some sense, "instituted by Christ." Of the seven sacraments accepted by Eastern Orthodoxy and Roman Catholicism, such institution can be incontrovertibly documented from the New Testament for only two, baptism and the Eucharist. In fact, the very concept of "institution" appears to have entered sacramental theology from consideration of the Eucharist, for every reference to baptism in the sayings of Jesus seems to presuppose its prior existence and there are no "words of institution" for baptism to correspond to the four versions of such words that the New Testament presents for the Eucharist.

During the debates of the 16th and 17th centuries, the language of the New Testament was strained by both sides in an effort to prove that the historical Jesus really did, or really could not have, instituted marriage, ordination, etc., as sacraments. Protestant biblical scholarship eventually came to recognize that even the accounts of the institution of the Eucharist by Christ are, in their present form at least, products of the recollection of the primitive Christian community rather than verbatim transcripts of the sayings of the historical Jesus. Roman Catholic theology likewise surrendered the effort to find explicit historical support for each of the seven sacraments in such sayings and concentrated instead on the implicit significance of the very establishment of the church: Christ instituted the sacraments in a theological sense, even though there is no way of proving that the historical Jesus instituted them in a historical sense.

Discussion of both these forms of theological revision thus replaced earlier controversy "about the number and the use of the sacraments." Baptism and the Eucharist are unquestionably primary for all Christians. Is confirmation, for example, derived from baptism as a necessary adjustment to the development of infant baptism? Is a sacramental view of penance the answer of the church, in harmony with the ordinance of Christ, to the unforeseen question of sin after baptism? Such questions as these made conventional debates obsolete, while at the same time putting the concerns of an earlier generation into a new and more favourable light.

Christianity is not, of course, the only world religion that has "sacraments"; the use of worship rituals as means of effecting the right relation between God and man is one of the most nearly universal phenomena in religion. Thus the clarification of what Christianity means by its sacraments is both an examination of its uniqueness and an affirmation of its link—as correction and fulfillment, if not as continuity—with other pictures of the relation between God and man.

See also RELIGION; RELIGION, PRIMITIVE; and references under "Sacrament" in the Index.

BIBLIOGRAPHY.—In addition to the works listed in the bibliographies of the several articles on the sacraments, the following deserve consideration: O. C. Quick, *The Christian Sacraments* (1927); Bernard Leeming, S.J., *Principles of Sacramental Theology* (1956); A. M. Landgraf, *Dogmengeschichte der Frühscholastik*, iii–1 and iii–2 (1954–55); P. T. Forsyth, *The Nature and Function of the Sacraments* (1917). (J. J. PN.)

SACRAMENTALS, in the Roman Catholic Church, originally denoted the ceremonies, outside the essentials, used in the administration of the sacraments to elevate the mind to the contemplation of the divine mysteries; *e.g.*, genuflections during Mass, the anointing of the priest's hands during ordination, the triple pouring at baptism. In a larger sense, they are all the other external signs employed by the church to obtain spiritual effects. These signs can be actions (exorcisms, making the sign of the cross, saying of grace at meals, blessings, etc.) or things (holy water, blessed candles, vestments, palms and ashes, crucifixes, rosaries, etc.).

The sacramentals are like sacraments in that they are sensible signs and symbols. They differ from the sacraments in that they do not give grace of themselves; rather, their special spiritual effects, *e.g.*, an increase of charity, derive from the power of the church's prayer and are conditioned by the dispositions of the user. *See* also LITURGY: *Other Latin Rites: Rites Other than Sacraments.*

See J. Sullivan, *The Externals of the Catholic Church* (1959). (E. J. A.)

SACRAMENTARY (Latin *sacramentarium*), a book, also called *Liber sacramentorum,* formerly used in some Roman Catholic ceremonies, especially the Mass. Its contents are in general ancient prayers of the Mass—those that do not vary (in the "Ordinary") and those that do: collects, secrets, post-communions, prefaces, and prayers over the people. Along with the ordines, which contained the directions for the actions of a ceremony (*see* ORDINES ROMANI), sacramentaries formed an important source of modern Latin-rite liturgical books, such as the missal (*q.v.*) and pontifical (*q.v.*). It is thought that historically sacramentaries derived from various *libelli,* booklets, which were smaller and less complete orders of services, used in the Roman churches.

There are three sacramentaries, if the term is used in a broad sense, that are of special importance and have been the object of special use and study. (1) The first is the Leonine, so called because it was once falsely attributed to St. Leo the Great (d. 461). This compilation of Masses, sometimes a great variety of them for the same feast, is not a sacramentary in the strict sense but the fragment of a collection of Roman *libelli* possibly intended to be a source book of some kind. It was compiled about the middle of the 6th century, discovered in the library of the cathedral chapter at Verona in the first part of the 18th century, and then almost immediately published. (2) The second sacramentary, the Gelasian, is a 6th-century Roman book with an overlay of Gallican and other influences. The thickness of the overlay in various manuscripts illustrates the stages of its development. The oldest manuscript, dated about 700 and first published in 1680, was made for the Abbey of St. Denis in Paris and is now in the Vatican library. This is a more complete sacramentary than the Leonine. Its attribution to a particular papal author (Gelasius I, d. 496) is not correct. (3) The third sacramentary, the Gregorian, which goes back to Pope Gregory the Great (d. 604), was in part sent by Pope Adrian I to Charlemagne, and as a result its formative influence in the liturgy of the West was enormous. Its first printed edition was published in 1571. The Gregorian sacramentary has three parts: the ordinary of the Mass; collects and so forth for a liturgical year that begins with Christmas Eve; and the ordination prayers.

SACRAMENTO, the capital city of California, U.S., and seat of Sacramento County, is located about 75 mi. NE of San Francisco at the confluence of the American and Sacramento rivers, midway between the Sierra Nevada Range and the Pacific Ocean. Because of climatic factors favourable to growing camellias, the city became known as "the camellia capital."

History.—In August 1839, John Augustus Sutter (*q.v.*), a Mexican citizen, established a colony, known as New Helvetia, on the site of the future city. He had received a land grant of 11 square leagues (about 73 sq.mi.) from the Mexican governor Juan Alvarado and between 1839 and 1844 he used Indian labour to build an adobe fortress known as Fort Sutter. Situated as it was on the main line of travel, Fort Sutter soon became one of the greatest trading posts in California. Sutter extended unbounded hospitality to American immigrants between 1843 and 1848. James W. Marshall, an employee of Sutter, was supervising the construction of a sawmill on the American River near Coloma, 35 mi. NE of the fort, when, on Jan. 24, 1848, he found a gold nugget in the millrace. The discovery of gold on his land was, ironically, the cause of Sutter's ruin, for his men deserted him, gold seekers pillaged his property, and he died a poor man.

Sutter's son, who had been deeded the family property near the Embarcadero along the river, laid out a town there named after the Sacramento River. The federal census reported a population of 6,820 as early as 1850, the year that Sacramento was incorporated. Strategically located at the entrance to the gold areas, the city became a typical mining boomtown of about 10,000 within a few months.

When state government was established in 1849, Sacramento campaigned to be named the capital and offered $1,000,000 for the honour; in 1854 it was chosen the permanent seat of government. Three times between 1849 and 1853, and again in 1861, the city suffered from devastating floods, and in 1852 two-thirds of it was destroyed by fire.

Sacramento was a major depot on the overland mail routes between the Missouri frontier and the Pacific during the 1850s. When the pony express was established in 1860, the city became the western terminal. As early as 1856 the Sacramento Valley Railroad was completed to Folsom, 24 mi. NE, and was the first railway in the state to tap the freighting business between the gold camps by providing faster service than the freight wagons on the roads and trails. Theodore Dehone Judah, the chief engineer of the railroad, planned to extend the line across the Sierra Nevada. He found four merchants in Sacramento, Leland Stanford, Mark

BY COURTESY OF SACRAMENTO CITY-COUNTY CHAMBER OF COMMERCE

THE STATE CAPITOL, CONSTRUCTED 1869–74, IN THE HEART OF DOWNTOWN SACRAMENTO

Hopkins, Charles Crocker, and Collis P. Huntington, willing to help finance and promote his transcontinental project. These men became the founders of the Republican Party in California and gained generous government support for their Central Pacific Railroad, constructed 1863–69. With the advent of rail transportation into the area, the future of Sacramento was assured.

Population.—The population of Sacramento city in 1960 was 191,667, an increase of 54,095 since the 1950 census representing a 39.3% growth. The standard metropolitan statistical area (SMSA) of Sacramento comprising Sacramento County had a population of 502,778 in 1960 and included North Sacramento, Arden, Folsom, Natomas, Del Paso Heights, Town and Country area, Carmichael, Fair Oaks, North Highlands, Citrus Heights, and Orangeville, all on the east side of the Sacramento River, with populations ranging from 5,000 to 45,000. The rapid growth of suburban communities in the Sacramento vicinity has caused the population growth of the county (81.4% between 1950 and 1960) to exceed that of the state. In 1963 Placer and Yolo counties were added to the SMSA, resulting in a new area of 3,441 sq.mi. and an adjusted 1960 census figure of 625,503. (For comparative population figures *see* table in CALIFORNIA: *Population.*)

Administration.—Sacramento adopted a council-manager form of government in 1921. The nine members of the city council are elected for a two-year term. Sacramento County government is based upon a state charter providing for the election of five supervisors for four-year terms from defined geographic districts. A city-planning board was established in 1926 and zoning ordinances are in effect.

Transportation, Commerce, and Industry.—Sacramento is on the main line of two transcontinental railroads and there is a connection with a third. Two major east-west transcontinental highways and the principal north-south Central Valley route come together at Sacramento, making it a hub of highway transportation. Sacramento County has 14 airports: one is municipally controlled, one is administered by the county, two are United States Air Force installations, and the remainder are privately owned. Barge service along the Sacramento River connects the city with the port of San Francisco and is used extensively in transporting agricultural and petroleum products.

Sacramento is the centre of an extensive wholesale and retail trade. Because of the surrounding region's high agricultural productivity, canning and food processing is the principal manufacturing activity with more than 100 plants. Associated with this agricultural processing are flour millers, bean and rice cleaners and polishers, olive-packing plants, and one of the world's largest almond-shelling plants. Among other large industrial establishments are manufacturers of jet-propellants, soaps and detergents, furniture, machine engine parts, boxes, brick and clay pipe, and mining equipment. There are also large railroad shops and three military installations that maintain and repair aircraft. Natural gas fields in the vicinity and water power from the Sacramento River system provide the area with ample power facilities.

Education and Cultural Activities.—Public education is available from kindergarten through college. A public junior college, Sacramento City College, was established in 1916. American River Junior College, opened in 1955, was relocated on a new campus in 1958. Sacramento State College (1947) emphasizes teacher education. The University of California Davis campus is 15 mi. W.

The state library has an outstanding collection on the history of California, a fine law library, and is an extensive depository of government documents. The E. B. Crocker Art Gallery houses one of the largest and most valuable collections west of the Mississippi River. The municipal auditorium, completed in 1927, seats 5,000 and is a centre of cultural entertainment.

Parks and Recreation.—The state capitol, located in the heart of downtown Sacramento, is surrounded by a 40-ac. park, with numerous varieties of native American and foreign trees and shrubs, comprising one of the most diversified horticultural collections to be found within an area of similar size. The capitol, constructed 1869–74, is four stories high, surmounted by a large dome, and is Roman Corinthian in design. In 1951 a large annex, the east wing, was added to the building. One mile east of the capitol is old Fort Sutter, maintained by the state as a historic museum, surrounded by a public garden.

A vast network of waterways in the Sacramento area provides about 1,500 mi. of picturesque routes for boating enthusiasts. Folsom Lake, 14 mi. long and covering 11,500 ac., provides for water skiing and other aquatic sports. (W. T. J.)

SACRAMENTO RIVER, the largest and most important stream in northern California, U.S., rises in the Klamath Mountains near Mt. Shasta and empties into San Francisco Bay. The river is slightly less than 400 mi. long, but close to 600 if measured from the source of its longest tributary, the Pit. Flowing southward for most of its length, it turns westward just below the city of Sacramento, unites with the northward-flowing San Joaquin near Pittsburg, and passes through Suisun and San Pablo bays and San Pablo Strait into San Francisco Bay. Its navigability varies with water level and dredging operations, with Red Bluff, about 250 mi. upstream, being accessible to small craft at high water. The Sacramento and its tributaries, especially the American and Feather rivers, were the scene of the famous California Gold Rush of 1849. Together with the San Joaquin, the Sacramento forms the great Central Valley of California, one of the richest agricultural areas in the world.

The Sacramento (northern) portion of the valley has only one-third of the arable land but two-thirds of the water resources (an average annual runoff of about 22,000,000 ac-ft.). To control floods and shift surplus water to the more arid San Joaquin region, the Central Valley Project was launched by the Federal Bureau of Reclamation in the 1930s. The project includes various dams, such as Shasta near Redding, reservoirs, power plants, and canals. The joint state-federal multipurpose Feather River Project, rated as the largest single water project in history and including the immense Oroville Dam, was undertaken in the 1960s. (D. E. F.)

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour himself. Though it had its origins in the Middle Ages, when it was confined to a few mystics, was later fostered by the Carthusians and the Jesuits, and was further promoted by St. Francis of Sales and the Visitandines, it was the Visitandine nun St. Margaret Mary Alacoque (*q.v.*), assisted by Claude de la Colombière (*q.v.*), who gave shape to and spread the devotion. It was strongly opposed by the Jansenists, who claimed that the heart of Christ was being adored as separate from the rest of his being. The Jansenist Synod of Pistoia (*q.v.*), which formulated this objection, was condemned by Pius VI in the bull *auctorem fidei,* Aug. 28, 1794. In 1856 Pius IX introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration.

BIBLIOGRAPHY.—*Catholic Encyclopedia,* vol. vii, pp. 163–167; *Dictionnaire de théologie catholique,* tome iii, col. 271–351 (1908); *Enciclopedia Cattolica,* vol. iv, col. 1059–64 (1950).

SACRED HEART, BROTHERS OF THE (SOCIETAS FRATRUM SACRIS CORDIS; S.C.), a Roman Catholic religious order founded in 1821 in Lyons, France, by André Coindre, a missionary priest, is primarily a teaching order, specializing in high school and elementary school education in both parochial and private schools. The brothers arrived in the United States in 1847, from where they spread rapidly into Canada; there are seven Canadian provinces and three U.S. provinces. The brothers are also a missionary society with missions all over the world. The motherhouse is in Rome. *See* ORDERS AND CONGREGATIONS, RELIGIOUS. (A. RO.)

SACRED HEART, MISSIONARIES OF THE (in full, SOCIETY OF THE MISSIONARIES OF THE SACRED HEART OF JESUS; SOCIETAS MISSIONARIORUM SACRATISSIMI CORDIS JESU; M.S.C.), is a Roman Catholic congregation of men founded at Issoudun, France, Dec. 8, 1854, by Jules Chevalier, a secular priest, for restoring the faith in the rural sections of France. Pius IX directed the congregation to foreign-mission work. The M.S.C. have provinces in Europe, the Americas (two in the U.S.), and Australia, and do foreign-mission work on all the continents and in the Pacific islands. The general motherhouse is in Rome. *See* ORDERS AND CONGREGATIONS, RELIGIOUS. (L. F. P.)

SACRED HEART, PRIESTS OF THE (in full, CONGREGATION OF THE PRIESTS OF THE SACRED HEART OF JESUS; CONGREGATIO SACERDOTUM A SACRO CORDE JESU; S.C.J.), a congregation of priests and brothers founded in Saint-Quentin, France, in 1878, by P. Dehon. Its aim is to spread the apostolate of the Sacred Heart and to undertake all forms of the priestly ministry: teaching, missions, retreats, home and foreign missions. The congregation has spread to five continents and to several states in the U.S. Generalate headquarters are located in Rome. *See* ORDERS AND CONGREGATIONS, RELIGIOUS. (J. T. O'C.)

SACRED SCRIPTURES. Most religions, primitive and advanced, have either what may be truly designated as sacred scriptures or what fulfills in some degree the function of sacred scriptures. In the case of preliterate peoples, the material, handed down orally from generation to generation, though it may lack the precise form and content of written scriptures, is usually a fairly well-defined body of material, considered authoritative and even sacred.

Sacred scriptures may be said to provide the fundamental basis of beliefs concerning the God or gods and man's relationship to them, as well as the practices that flow from that relationship, whether ritual, social, or what may be regarded as moral. In short, they form the authoritative basis for the religious and usually also for the ethical beliefs and practices of a people or faith. They may contain much more—*e.g.*, the storied origins of the world and of the people as well as their early history, though ordinarily that is merely the detailed account of the God or gods and their dealings with man. They may include also the best of the ancient poetry of a people, but this is likely to be chiefly the expression of man's sentiments as he seeks to relate himself to the divine, in praise of, in thanksgiving, or in devotion to deity. They may also contain a great deal of what might appear to be secular law, or binding custom, but this too is usually but the logical extension of the divine rule over man's behaviour.

Most of the world's great religions have written scriptures, definitely limited as to what they include—that is, with a fixed canon, to which nothing can be added and from which nothing may be taken away. There may be sectarian differences within a religion as to the exact content of a canon (as, for example, between the Roman Catholic and Protestant churches within Christianity), but within a given group it is usually invariable. Some of the older religions, now no longer current—as those of Greece, Rome, Egypt, and Babylonia—had all the materials of scripture but never a specifically limited canon. Most scriptures are considered to be of divine origin, divinely inspired or revealed in some way to man.

Some religions, as Islam, fundamentalist Christianity, and others, hold to a strict verbal inspiration that extends to every word of the sacred text. The Hindus have one group of writings, *shruti*, which is regarded as the *ipsissima verba*, the very, very word of God, and another group that, while still sacred, was inspired in a more general way. In some religions, such as Buddhism and Jainism, there is no claim of divine inspiration, but long tradition has given the scriptures almost the same authority as the divinely inspired writings.

As a corollary to this belief in the revealed or authoritative nature of the scriptures, they are practically inviolable. They may even become an object of cult as seems to be the case of the Sikh Bible, the Granth. They are not to be treated as other writings. The first beginnings of scientific critical study of sacred scriptures usually provoke violent resistance.

Because of their great influence on their respective cultures the sacred scriptures have frequently been (and still are, where education has not become secular) the major basis of the education of children and often also the basis of civil and even criminal law.

The best-known scriptures are: (1) Judaeo-Christian faith, the Bible (*q.v.*); this for Jews means the Old Testament only. (2) Islam, the Koran (*q.v.*). (3) Zoroastrianism (*q.v.*), the Avesta. (4) Sikhism, the Granth (*q.v.*). (5) Buddhism, in the south, the Theravadin or Pali canon; although there was a Sanskrit canon upon which Mahayana or northern Buddhism was largely based, Mahayana has no fixed canon (*see* BUDDHISM; TRIPITAKA). (6) Confucianism, the five canonical books and the four classics. (7) Taoism (*q.v.*), the *Tao-te ching* (*see* LAO-TZU). (8) Hinduism has no single name to cover all the scriptures, but the Vedas, which term usually is taken to include also the Brahmanas (*q.v.*) and the Upanishads, constitute the major part of the *shruti* writings. (9) Shinto has no concept of scripture as discussed here, but the *Kojiki* (*q.v.*) and *Nihongi* (*q.v.*) are quasi-scriptural writings. (10) Jainism has a sacred literature comprising several works (*see* JAINISM).

See also references under "Sacred Scriptures" in the Index.

BIBLIOGRAPHY.—Selections from most of the scriptures may be found in Robert O. Ballou (ed.), *The Bible of the World* (1939); Lewis Browne, *The World's Great Scriptures* (1946). A general introduction to all the sacred scriptures is Charles S. Braden, *The Scriptures of Mankind* (1952), with ample bibliographies, including the better translations into English, for each faith. (C. S. B.)

SACRIFICE. The Latin *sacrificare* (*sacer*, "holy"; *facere*, "to make") referred to the act of offering objects to a god (or other supernatural being), thereby making them the property of the god and thus holy. In a sense, what is always offered in sacrifice is, in one form or another, life itself. Sacrifice is a celebration of life, a recognition of its divine and imperishable nature. In the sacrifice the consecrated life of an oblation is liberated as a sacred potency which establishes a bond between the sacrificer and the Sacred. Through sacrifice life is returned to its divine source, regenerating the power (*i.e.*, life) of that source; life is fed by life. Hence the word of the Roman sacrificer to his god: "Be thou increased [*machte*] by this offering." It is, however, an increase of sacred power which is ultimately beneficial to the sacrificer. In a sense, sacrifice is the impetus and guarantee of the reciprocal flow of the divine life force between its source and its manifestations.

Often the act of sacrifice involves the destruction of the oblation, but this destruction—whether by burning, slaughter, or whatever means—is not in itself the sacrifice, the "making holy." The killing of an animal is the means by which its consecrated life is "liberated" and thus made available to the deity, and the destruction of a food offering in an altar's fire is the means by which the deity receives (by olfaction, rather than ingestion) the offering. Sacrifice as such, however, is the total act of offering and not merely the mode in which it is performed.

Sacrificial rites are known throughout the history of religions, and although they have assumed a multitude of forms and intentions, the fundamental meaning is that of effecting a necessary and efficacious relationship with sacred power and of establishing man and his world in the sacred order.

As a manifestation of man's experience of sacred reality, sacrifice is rooted in the religious consciousness. Hence any consideration of its possible origins, like that of the origins of religion itself, is more a matter of conjecture and speculation than of verifiable historical or phenomenological investigation. Attempts have been made (notably by E. B. Tylor, W. Robertson Smith, and J. G. Frazer) to discover the genesis of sacrifice, but these attempts, though helpful for a greater understanding of sacrifice, have not been conclusive.

Sacrifices may be broadly classified according to the material of the oblation, the mode in which the oblation is offered, the frequency of performance, and the specific intention of the rite. These categories, of course, often overlap.

Material of the Oblation.—Any form under which life manifests itself in the world may be a sacrificial oblation. The variety of sacrificial offerings can conveniently be discussed as (1) blood offerings (animal and human) and (2) bloodless offerings (libations and vegetation).

Blood Offerings.—Basic to both animal and human sacrifice is the recognition of blood as the sacred life force in man and beast. Thus its great potency has been utilized through sacrifice for a number of purposes—*e.g.*, earth fertility, purification, and expiation. However, as will be discussed below, the letting of blood was neither the only end nor the only mode of human and animal sacrifice.

A wide variety of animals have served as sacrificial offerings. In ancient Greece and India, for example, oblations included a

number of important domestic animals such as the goat, ram, bull, ox, and horse. Moreover, in Greek religion all edible birds, wild animals of the hunt, and fish were used. In ancient Judaism the kind and number of animals for the various sacrifices was carefully stipulated so that the offering might be acceptable and thus fully effective. This sort of regulation is generally found in sacrificial cults: the offering must be appropriate either to the deity to whom, or to the intention for which, it is to be presented. Very often the sacrificial species (animal or vegetable) was closely associated with the deity to whom it was offered as the deity's symbolic representation or even its incarnation. Thus in the Vedic ritual the goddesses of Night and Morning received the milk of a black cow having a white calf; while the "bull of heaven," Indra, was offered a bull, and Surya, the sun-god, a white, male goat. Likewise the ancient Greeks sacrificed black animals to the deities of the dark underworld; swift horses to the sun-god, Helios; pregnant sows to the earth mother, Demeter; and the dog, guardian of the dead, to Hecate, goddess of darkness. The Syrians sacrificed fish, regarded as the lord of the sea and guardian of the realm of the dead, to the goddess Atargatis, and ate the consecrated offering in a communion meal with the deity, sharing in the divine power. An especially prominent sacrificial animal was the bull (or its counterparts, the boar and the ram), which, as the representation and embodiment of the cosmic powers of fertility, was sacrificed to numerous fertility gods (*e.g.*, the Norse god Freyr; the Greek "bull of the earth," Zeus Cthonios; and the Indian "bull of heaven," Indra). It is because the divine nature of these animals is recognized that they are sacrificed. Through the sacrifice—through the return of the sacred life revealed in these species—the god lives, and therefore man and nature live.

The occurrence of human sacrifice appears to have been universal and its intentions various, ranging from communion with a god and participation in his divine life to expiation and the promotion of the earth's fertility. Of all the worldly manifestations of the life force, the human undoubtedly impressed men as the most valuable and thus the most potent and efficacious as an oblation. In many societies human victims gave place to animal substitutes or to effigies made of dough, wood, or other materials. Thus in India with the advent of British rule human sacrifices to the Dravidian village goddesses (*gramadevata*) were replaced by animal. In Tibet, under the influence of Buddhism, which prohibits all blood sacrifice, human sacrifice to the pre-Buddhist Bön deities was replaced by the offering of dough images or reduced to pantomime. Moreover, in some cults both human and animal oblations could be "ransomed"—*i.e.*, replaced by offerings of money or other inanimate valuables. (*See* HUMAN SACRIFICE.)

Bloodless Offerings.—Among the many life-giving substances which have been used as libations are milk, honey, vegetable and animal oils, beer, wine, and water. Of these the last two have been especially prominent. Wine is the "blood of the grape" and thus the "blood of the earth," a spiritual beverage which invigorates gods and men. Water is always the sacred "water of life," the primordial source of existence (thus the symbolism of the waters of creation, the placental waters), and the bearer of the life of plants, animals, human beings, and even the gods. Because of its great potency water, like blood, has been widely used in purificatory and expiatory rites to wash away defilements and restore spiritual life. It has also, along with wine, been an important offering to the dead as a revivifying force.

Vegetable offerings have included not only the edible herbaceous plants but also grains, fruits, and flowers. In both Hinduism and Jainism, flowers, fruits, and grains (cooked and uncooked) are included in the daily temple offerings. In some agricultural societies (*e.g.*, those of West Africa) yams and other tuber plants have been important in planting and harvest sacrifices and in other rites concerned with the fertility and fecundity of the earth. These plants have been regarded as especially embodying the life force of the deified earth and are frequently buried or plowed into the soil to replenish and reactivate its energies.

Mode of Sacrifice.—Along with libation and the sacrificial effusion of blood, one of the commonest means of making an oblation available to sacred beings is to burn it. In both ancient Judaism and Greek religion the major offering was the burnt or fire offering. Through the medium of the fire the oblation was conveyed to the divine receiver as a "sweet smelling savour." In ancient Greece the generic term for sacrifice (*thusia*), as well as that for altar (*thuein*), was derived from a root meaning "to burn" or "to smoke." In Judaism the important sacrifices (*'olah* and *zevach*) involved the ritual burning, either entirely or in part, of the oblation, be it animal or vegetation, and according to the Levitical code a sacred fire was to be kept burning in the Temple as the only fire for ritual use. For the Babylonians, also, fire was essential to sacrifice, and all oblations were conveyed to the gods by the fire-god, Girru-Nusku, whose presence as intermediary between the gods and men was indispensable. Likewise in the Vedic cult of ancient India the god of fire, Agni, received the offerings of men and brought them into the presence of the gods.

As burning is the appropriate mode for sacrifice to celestial divinities, so burial is the appropriate mode for sacrifice to earth divinities. Hence, in Greece, for example, sacrifices to the chthonic powers were often buried rather than burned or, if burned, burned near the ground or even in a trench. In Vedic India the blood and entrails of animals sacrificed on the fire altar to the sky-gods were put upon the ground for the earth divinities, including the ghosts and malevolent spirits. In West Africa yams and fowls sacrificed to promote the fertility of the earth are planted in the soil.

In sacrifice by burning and by burial, as also in the effusion of blood, the prior death of the human or animal victim, even if ritually performed, is in a sense incidental to the sacrificial action. There are, however, sacrifices (including, of course, live burial and burning) in which the ritual killing is itself the means by which the offering is effected. Illustrative of this mode was the practice in ancient Greek and Indian cults of making sacrifices to aquatic spirits by drowning the oblations in sacred lakes or rivers. Similarly the Norse cast human and animal victims over cliffs and into wells and waterfalls as offerings to the divinities dwelling therein. The Norse also sacrificed by hanging animal or human offerings by the neck from poles or trees in sacred groves. In the Aztec sacrifice of human beings to the god Xipe, the victim was lashed to a scaffold and shot to death with bow and arrow.

There are, finally, sacrifices that do not involve the death or destruction of the oblation. Such were the sacrifices in ancient Greece of fruits and vegetables at the so-called "pure" (*katharos*) altar of Apollo at Delos, at the shrine of Athena at Lindos, and at the altar of Zeus "Most High" in Athens. These "fireless oblations" (*apura hiera*) were especially appropriate for the deities of vegetation and fertility; *e.g.*, Demeter and Dionysus. In Egypt bloodless offerings of food and drink were simply laid before the god on mats or a table in a daily ceremony called "performing the presentation of the divine oblations." In both Greek and Egyptian cults such offerings were never to be eaten by the worshipers, but they were probably surreptitiously consumed by the priests or temple attendants. In ancient Israel, on the other hand, the food offerings of the "table of the shewbread" (the "bread of the presence") were regarded as available to the priests and could be given by them to the laity. Likewise in Hinduism the daily offering of cooked rice and vegetable, after its consecration, is distributed by the priests to the worshipers as the deity's "grace" (*prasada*). In some cases the sacrificial gifts are put out to be eaten by an animal representative of the deity. Offerings of cakes to the Vedic god Rudra were left at a mole's hole to be consumed by an animal sacred to the deity. In Dahomey wandering dogs consume, on behalf of the trickster deity Legba-Eshu, the consecrated food oblations presented to the god each morning at his shrines.

Frequency of Sacrifice.—In many cults sacrifices are distinguished by frequency of performance into two types, regular and special. Regular sacrifices may be daily, weekly, or monthly, or seasonal (as at planting, harvest, and New Year). Also often included are sacrifices made at specific times in each man's life—birth, puberty, marriage, and death. Offerings made on special occasions and for special intentions include, for example, sacrifices in times of danger, sickness, or crop failure, and those performed

at the construction of a building, for success in battle, or in thanksgiving for a divine favour.

In the Vedic cult of India the regular sacrifices were daily, monthly, and seasonal. The daily rites included fire offerings to the gods and libations and food offerings to the ancestors and the earth divinities and spirits. The monthly sacrifices, conducted at the times of new and full moons, were of cakes or cooked oblations to sundry deities, especially the storm-god Indra. Some daily and monthly sacrifices could be celebrated in the home by a householder, but only the official priesthood could perform the complex seasonal sacrifices, offered three times a year for the purpose of expiation and of abundance at the beginning of spring, of the rainy season, and of the cool weather. Of the occasional sacrifices, which could be celebrated at any time, especially important were those associated with kingship, such as the royal consecration and the great "horse sacrifice" performed for the increase of the king's power and domain.

In ancient Judaism the regular or periodic sacrifices included the twice daily burnt offerings, the weekly sabbath sacrifices, the monthly offering at the new moon, and annual celebrations such as Passover, Purification (Yom Kippur), first fruits, and the Feast of Booths (Sukkoth). Special sacrifices were usually of a personal nature, such as thank and votive offerings and "guilt offerings."

Intentions.—Sacrifices have been offered for a multiplicity of intentions, and it is possible here to list only some of the most prominent. In any one sacrificial rite a number of intentions may be expressed, and the ultimate goal of all sacrifice is to establish a beneficial relationship with the Sacred, to make the sacred power present and efficacious.

Propitiation and Expiation.—Serious illness, drought, pestilence, epidemic, famine, and other misfortune and calamity have universally been regarded as the workings of supernatural forces. Often they have been understood as the effects of offenses against the sacred order committed by individuals or communities, deliberately or unintentionally. Such offenses break the relationship with the Sacred, or impede the flow of divine life, in either case bringing woe to man. Thus it has been considered necessary in times of crisis, individual or communal, to offer sacrifices to propitiate sacred powers and to wipe out offenses (or at least neutralize their effects) and restore the relationship.

Among the Yoruba of West Africa, blood sacrifice must be made to the gods, especially the earth divinities, who, as elsewhere in Africa, are regarded as the divine punishers of sin. For the individual the oblation may be a fowl or a goat; for an entire community it may be hundreds of animals (in former days the principal oblation was human). Once consecrated and ritually slain the oblations are buried, burnt, or left exposed, but never shared by the sacrificer.

Similar to the Yoruba rite was the ancient Greek *sphagia,* a propitiatory sacrifice made to the chthonic deities and forces (including the winds and the spirits of the dead). Contrary to the practice in the joyful sacrifices to the celestial gods, there was no sharing of the oblation by the worshipers in the *sphagia.* The victim (a human being or animal substitute) was hacked to pieces and burned, buried, or cast into a river.

In ancient Judaism the *chattah* or so-called "sin offering" was an important ritual for the expiation of certain, especially unwittingly committed, defilements. The guilty (a priest, king, commoner, or entire community) laid their hands upon the head of the sacrificial animal (an unblemished bullock or goat), thereby identifying themselves with the victim, making it their representative (but not their substitute, for their sins were not transferred to the victim). After the priest had killed the beast, blood was sprinkled upon the altar and elsewhere in the sacred precincts. The point of the ritual was to purify the guilty and to reestablish the holy bond (covenant) with God through the blood of the consecrated victim. It was as such an expiatory sacrifice that early Christianity regarded the life and death of Christ. By the shedding of his blood, the sin of mankind was wiped out and a new relationship of life—eternal life—was effected between God and man. Like the innocent and "spotless" victim of the *chattah,* Christ died for men—*i.e.,* on behalf of, not in place of them. Also like the *chattah,* the point of his death was not the appeasement of divine wrath but the shedding of his blood for the wiping out of sin. The major difference between the sacrifice of Christ and that of the *chattah* animal is that his was regarded as a voluntary and effective sacrifice for *all* men, and as the perfect sacrifice, made once in time and space but perpetuated in eternity by the risen Lord.

There are sacrifices, however, in which the victim does serve as a substitute for the guilty. In some West African cults a person believed to be under death penalty by the gods offers an animal substitute to which he transfers his sins. The animal, ritually killed, is buried with full funeral rites as though it were the human person.

Finally, some propitiatory sacrifices are clearly prophylactic, intended to avert possible misfortune and calamity, and as such they are really bribes offered to the gods. Thus in Dahomey libations and animal and food offerings are frequently made to a variety of earth spirits to ensure their good favour.

Gift Sacrifices.—Although all sacrifice involves the giving of something, there are some sacrificial rites in which the oblation is regarded as a gift made to a deity either in expectation of a return gift or as the result of a promise upon the fulfillment of a requested divine favour.

The exchange of gifts is expressed in the Roman sacrificial formula *do ut des:* "I give that thou mayest give." In India a similar view of sacrifice was expressed in the *suktavata* formula near the end of the Vedic ritual, where upon the declaration that the god has accepted and been strengthened by the offering, the sacrificer states his hope that he may prosper by the god as the god has by him. Usually the expected or desired return gift is made known to the god, and it is understood that by accepting the gift the god has obligated himself to the sacrificer. There is, however, no sense of bribe or coercion here, for the worshiper knows that the deity is all-powerful and will finally do what he wishes, gift or no gift. Moreover the giver always gives something of himself in his gift so that by the reciprocal act of giving and receiving man and god are bound together and "participate" in one another.

Of the second sort of gift sacrifice, the votive offering, numerous instances are recorded. In ancient Greece, sacrifices were vowed to Athena, Zeus, Artemis, and other gods in return for victory in battle. The solemnity and irrevocability of the votive offering is seen in the Old Testament account of Jephthah's sacrifice of his only child in fulfillment of a vow to Yahweh (Judg. 11:30–40).

Thank Offerings.—One form of thank offering is the offering of the first fruits in agricultural societies. Until the first fruits of the harvest have been presented with homage and thanks (and often with animal sacrifices) to the deity of the harvest (sometimes regarded as embodied in the crop) the whole crop is considered sacred and thus taboo and may not be used as food. The first-fruits sacrifice has the effect of "desacralizing" the crops and making them available for profane consumption. It is a recognition of the divine source and ownership of the harvest and the means by which man is reconciled with the vegetational, chthonic powers from whom he takes it.

Fertility.—Another distinctive feature of the first-fruits offering is that it serves to replenish the sacred potencies of the earth depleted by the harvest and to ensure thereby the continued regeneration of the crop. Thus it is one of many sacrificial rites which have as their intention the seasonal renewal and reactivation of the fertility of the earth. Fertility rites usually involve some form of blood sacrifice—in former days especially human sacrifice (*e.g.,* India, Egypt, Africa, America). In some human sacrifices the victim represented a deity who "in the beginning" allowed himself to be killed so that from his body edible vegetation might grow. The ritual slaying of the human victim amounted to a repetition of the primordial act of creation and thus a renewal of vegetational life. In other human sacrifices the victim was regarded as representing a vegetation spirit that annually died at harvest time so that it might be reborn in a new crop. In still other sacrifices at planting time or in time of famine the blood of the victim—animal or human—was let upon the ground and its

flesh buried in the soil, to fertilize the earth and recharge its potencies.

Building Sacrifices.—Numerous instances are known of animal and human sacrifices made in the course of the construction of houses, shrines, and other buildings, and in the laying out of villages and towns. Their purpose has been to consecrate the ground by establishing the beneficent presence of the Sacred and by expelling or rendering harmless the demonical powers of the place. In some West African cults, for example, before the central pole of a shrine or a house is installed, an animal is ritually slain, its blood being poured around the foundations and its body being put into the post hole. On the one hand this sacrifice is made to the earth deities and the supernatural powers of the place—the real owners—so that the human owner may take possession and be ensured against malevolent interference with the construction of the building, its later occupation and use. On the other hand, the sacrifice is presented to the cult deity in order to establish its benevolent presence in the building.

Mortuary Sacrifice.—Throughout the history of man's religions the dead have been the recipients of offerings from the living. In ancient Greece an entire group of offerings (*enagismata*) was consecrated to the dead; these were libations of milk, honey, water, wine, and oil poured onto the grave. In India water and balls of cooked rice were sacrificed to the spirits of the departed. In West Africa offerings of cooked grain, yams, and animals are made to the ancestors residing in the earth. The point of such offerings is not (as popularly regarded) that the dead get hungry and thirsty, nor are they merely propitiatory offerings. Their fundamental intention seems to be that of increasing the power (*i.e.*, the life) of the departed. The dead partake of the life of the gods (usually the chthonic deities), and sacrifices to the dead are in effect sacrifices to the gods who bestow never-ending life. In Hittite funeral rites, for example, sacrifices were made to the sun-god and the other celestial deities—transcendent sources of life—as well as to the divinities of earth.

Communion Sacrifices.—Communion in the sense of a bond between the worshiper and the Sacred is, of course, fundamental to all sacrifice. Certain sacrifices, however, promote this communion by means of a sacramental meal. The meal may be one in which the sacrificial oblation is simply shared by the deity and the worshipers. Of this sort were the Greek *thusia* and the Jewish *zevach* sacrifices in which one portion of the oblation was burned upon the altar and the remainder eaten by the worshipers. Among the African Yoruba special meals are offered the deity; if the deity accepts the oblation (as divination will disclose) a portion of the food is placed before his shrine while the remainder is joyfully eaten as a sacred communion by the worshipers.

The communion sacrifice may be one in which the deity somehow indwells the oblation so that the worshipers actually consume the divine. The Aztecs, for example, twice yearly made dough images of the sun-god Huitzilopochtli which were consecrated to the god and thereby transubstantiated into his flesh to be eaten with fear and reverence by the worshipers. (For the Christian Holy Communion as sacrifice, *see* EUCHARIST.)

The Ritual of Sacrifice.—The sacrificial ritual, of course, varies widely according to the specific nature and intention of the sacrifice. Frequently special acts must be performed by the sacrificer before and sometimes also after the sacrifice. In the Vedic cult the sacrificer and his wife were required to undergo an initiation (*diksha*) involving ritual bathing, seclusion, fasting, and prayer, the purpose of which was to remove them from the profane world and to purify them for contact with the Sacred. At the termination of the sacrifice came a rite of "desacralization" (*avabhritha*) in which they, along with the priests, bathed in order to remove any sacred potencies which might have attached themselves during the sacrifice.

Another feature of many sacrifices is an "apology" addressed to the animal or human victim before its killing. In the Vedic rites the sacrificial animal was assured by the priests before its strangulation, "Thou dost not die; no harm is done thee; thou goest to the gods by pleasant paths."

A distinction is frequently made between the person offering the sacrifice and the person by whom the sacrifice is ritually performed. Sometimes this is one and the same person, as in Judaism when the male head of the family celebrates the liturgy of Passover on behalf of himself and his family, or in Hinduism when the householder performs the daily sacrifices of the domestic ritual. More often, however, the sacrifices are performed by a recognized priesthood (*q.v.*) which alone is regarded as possessing (by virtue of initiation or ordination) the knowledge or supernatural power to execute an acceptable and effective offering. Thus in ancient Judaism all Temple sacrifices had to be performed by the priesthood. In India sacrificial rituals often required three or four priests and on occasion as many as sixteen.

The common place of sacrifice in most cults is an altar (*q.v.*). However, the table type of altar is uncommon; more often it is only a pillar, a mound of earth, a stone, or a pile of stones. Among the Hebrews (in early times) and other Semitic peoples the altar of the god was frequently an upright stone (*mazzebah*) established at a place in which the deity had manifested itself (*see* HIGH PLACE). It was *beth-el,* the "House of God."

Frequently the altar is regarded as the centre or the image of the universe. For the ancient Greeks the grave marker (a mound of earth or a stone) was the earth altar upon which sacrifices to the dead were made and, like other earth altars, it was called the *ompholos,* "the navel of the earth"—*i.e.*, the central point from which terrestrial life originated. In Vedic India the altar was regarded as a microcosm, its parts representing the various parts of the universe and its construction being interpreted as a repetition of the creation of the cosmos.

(H. P. S.)

SACRILEGE, the violation or profanation of sacred things, a crime of varying scope in different religions. The word comes from the Latin *sacrilegium* (from *sacer,* "sacred"; *legere,* "to purloin"), which originally meant merely the theft of sacred things, although as early as Cicero's time it had grown to include in popular speech any insult or injury to them.

The primitive defense against sacrilege lay in the nature of sacred things, which held a curse for any violation or profanation (*see* TABU). As the concept of the sacred became less associated with magic, legal punishments for sacrilege came into being. The levitical code of ancient Israel exacted of the offender reparation for the damage with the addition of one-fifth of the amount and an expiatory sacrifice (Lev. 5:15–16). The story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most

graphic details of Old Testament history (Josh. 7:20–25). No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Hebrew, especially in its Temple laws, violation of which often led to mob violence as well as divine chastisement. The Temple rules do not apply to synagogues, however, and unseemly conduct in the synagogue is liable only to civil action.

In Greece, sacrilege was closely connected with treason: a temple was regarded as the home of a protector of the state, hence thievery of temple property was a crime against the state. In addition to sacrilege, the Greeks held the concept of "impiety," a lesser crime and more widely applicable. The mutilation of the hermae of Athens just before the Athenian expedition to Sicily in 415 B.C. thus ranked as an impiety (*see* HERM).

While the Roman cults were amply protected by tabus, there was no comprehensive term in Roman law for religious violations and profanations in general. According to Ulpian the punishment for *sacrilegium,* narrowly construed as the theft of sacred things from a sacred place, varied according to the position and standing of the culprit and the circumstances under which the crime was committed.

During classical times the law kept to the narrow meaning of *sacrilegium,* but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early Church Fathers use the word most frequently in the restricted sense (though an effort has been made to read the wider meaning in Tertullian). But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine, and Pope Leo I, *sacrilegium* means sacrilege. The wider meaning had invaded the Roman law as well, due partly to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code (effective Jan. 1, 439) the various crimes which are accounted sacrilege include apostasy (from Christianity), heresy, schism, Judaism, paganism, and attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, etc., and even of Sunday. There is no formal definition of sacrilege in the Code of Justinian (529), but the conception remains as wide.

The penitentials, early collections of disciplinary canons, gave much attention to sacrilege. The Frankish synods of the Middle Ages emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by torture. The period of the Reformation naturally increased the commonness of the crime of sacrilege. Under the emperor Charles V the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV decreed the same penalty for sacrilege joined to superstition and impiety. A sacrilege trial made famous by Voltaire's vain protests against its decision was that of J. F. Lefebvre de La Barre at Abbeville in 1766. Convicted of wearing his hat while a religious procession was passing, of blasphemy, and of having mutilated a crucifix standing on the town bridge, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned; the sentence was confirmed by the *parlement* of Paris and Louis XV, and carried out. In the midst of the French Revolution respect for civic festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In 1825 the reactionary *parlement* once more brought back the Middle Ages by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of clauses. This legislation was expressly and summarily abrogated in 1830.

In the contemporary Christian Church sacrilege is held to be either personal (*e.g.,* ill treatment of, or sins against chastity by, clerics or religious); real (*e.g.,* abuse or theft of, or irreverence toward, the sacraments or other sacred things, including simony [*q.v.*], or administering or receiving a sacrament while in a state of mortal sin); or local (*e.g.,* murder committed in a church). The Roman Catholic Code of Canon Law deals with it. Protestants, who generally deny the inherent sacredness of objects, give it little emphasis.

SACY, ANTOINE ISAAC SILVESTRE DE, BARON (1758–1838), French scholar, the leading orientalist of his age, who specialized in Arabic and Islamic studies. His interest in these was aroused early by a monk in an abbey opposite his home in Paris, where he was born on Sept. 21, 1758. He learned, privately, Arabic, Hebrew, Persian, and Turkish, and his studies ranged over Oriental history, geography, religion, and numismatics, as well as grammar and philology. In 1781 he entered the civil service, but resigned in 1792. As a fervent Catholic and monarchist, he was out of sympathy with the revolutionary regime. Nevertheless, in 1795, despite his refusal to take a required oath against monarchism, he was given the chair of Arabic in the newly founded École des Langues Orientales Vivantes, and in 1806 was appointed professor of Persian in the Collège de France. In 1815, he became rector of the University of Paris, and from 1815 was active in the Commission of Public Instruction. He was also official orientalist in the Ministry of Foreign Affairs (1805–29), making Arabic translations of various state documents. He was made a baron by Napoleon in 1813, and created a peer of France in 1832.

Despite his distinction as an orientalist, he only once traveled outside France, and then no further than Genoa. He died in Paris, Feb. 21, 1838.

His skill as a teacher is attested by the long list of his pupils—especially French and German—who achieved fame. His works include editions of *Hariri* and *Kalila and Dimna,* and the incomplete *Exposé de la religion des Druzes,* 2 vol. (1838), the result of over 30 years' study. Of immense influence were his textbooks.

Sacy's *Grammaire arabe,* 2 vol. (1810) set a new standard for such works, and his *Chrestomathie arabe,* 3 vol. (1806) and *Anthologie grammaticale* (1829) were also important.

See Henri Dehérain, *Silvestre de Sacy—ses contemporains et ses disciples* (1938); Émile Chassinat (ed.), *Bibliothèque des Arabisants Français,* 1st series, *Silvestre de Sacy,* vol. 1, pp. i–lix (1905).

SADDLE: *see* HARNESS AND SADDLERY.

SADDUCEES, the name of a party in Judaism which was opposed to the Pharisees down to the destruction of Jerusalem in A.D. 70. The basic difference between the two parties lay in their respective attitudes toward the Torah, the Sadducees representing the extreme conservative view. *See* JEWISH SECTS DURING THE SECOND COMMONWEALTH: *Pharisees* and *Sadducees;* JUDAISM.

SADE, DONATIEN ALPHONSE FRANÇOIS, COMTE DE (usually called the MARQUIS DE SADE) (1740–1814), French author, whose erotic and licentious writings have given his name to sadism. He was born in Paris on June 2, 1740, a descendant of one of the best Provençal families. In 1754 he began a military career, abandoning it in 1763, at the end of the Seven Years' War. He married in 1763 the elder daughter of the president of the Cour des Aides in Paris. He had two sons by her.

As governor-general of Bresse and Bugey, as lord of Saumane, La Coste, and other places, he led the life of a libertine. He was early convicted of debauchery and acts of violence; the police kept a watchful eye on him, and several times he was committed to prison. After an incident at Marseilles, involving four girls, in 1772 Sade was sentenced to death, in his absence, at Aix-en-Provence for "crimes of poisoning and sodomy." Though he was reprieved, he was recaptured and imprisoned at Miolans; he escaped and rejoined his wife at the château of La Coste, where he again attracted attention by new scandals. He fled to Italy in 1775 with his sister-in-law. On return to Paris in 1777, he was arrested, imprisoned at Vincennes, and again tried at Aix. He escaped, but was soon rearrested; after six years at Vincennes (1778–84), he was incarcerated at the Bastille, and finally, in 1789, at Charenton.

On his release in 1790, he offered several plays to the Comédie Française. In 1792 he became secretary of the Section des Piques, was one of four delegates appointed to visit the hospitals of Paris, and wrote several patriotic addresses. Because his name was mistakenly included on the list of *émigrés*, he was detained during the Terror but released a year later. He then lived in a state of near poverty with Mme Quesnet, an actress. In 1801 he was arrested as the author of *Justine*. He was moved from prison to prison, and in 1803 ended up at the Charenton lunatic asylum, near Paris, where he caused new scandals and where he died on Dec. 2, 1814.

Most of Sade's works were written in prison, where he spent more than 27 years of his life. His prose fiction includes *Justine* (1791), *Juliette* (1792), *Les 120 Journées de Sodome* (written in 1785; the manuscript was discovered in Germany and published in 1904), *Aline et Valcour* (1795), *La Philosophie dans le boudoir* (1795), and *Les Crimes de l'amour* (1800). Most of these works are still considered obscene; nearly all editions are unofficial. They were, however, esteemed by Sainte-Beuve, Baudelaire, and Swinburne; their influence on Lamartine, Barbey d'Aurevilly, Lautréamont, Dostoevski, and Kafka is well known. Guillaume Apollinaire and the Surrealists in general did much to rehabilitate them. Some French writers and critics (including Maurice Heine, Jean Paulhan, Maurice Blanchot, Maurice Nadeau, and Simone de Beauvoir) have undertaken the study of Sade's peculiar personality and have demonstrated the "infernale grandeur" of his writings. For many he has become more than the inventor of a sexual perversion: the type of the eternal rebel, the example of man seeking, in unbounded fury, to surpass the limits of the human condition.

Bibliography.—There is no complete edition of Sade's works, but good selections have been edited by M. Heine (1933), M. Nadeau (1947), and G. Lély (1948). *See* also *Correspondance*, ed. by P. Bourdin (1929). *See* also E. Dühren (Iwan Bloch), *Der Marquis de Sade und seine Zeit* (1900); W. Stekel, *Sadismus und Masochismus* (1925; first Eng. trans. 1935); C. R. Dawes, *The Marquis de Sade: His Life and Works* (1927); M. Blanchot, *Lautréamont et Sade* (1949); M. Praz, *The Romantic Agony*, 2nd Eng. ed. (1951); S. de Beauvoir, *Faut-il brûler Sade?* (1951–52; Eng. trans. in S. de Beauvoir, *The Marquis de Sade*, 1962, with selections from Sade); G. Lély, *Vie du Marquis de Sade*, 2 vol. (1952, 1957; Eng. trans. 1961). (Ma. N.)

SADEDDIN, HOCA (1536–1599), Turkish historian, was the author of the renowned *Tac üt-tevarih* ("Crown of Histories"). The son of Hasan Can, court chamberlain to Selim I, he was tutor to Prince Murad, governor of Manisa, and followed him to Istanbul when he became sultan as Murad III. He was influential in the palace and later accompanied Murad's son, Sultan Mohammed III, on his campaign in Hungary, playing an important part in the victory at Erlau (1596) by the moral support he gave at a critical hour. He was made shaikh ul-Islam in 1598.

The *Tac üt-tevarih*, which covers the period from the origins of the Ottoman empire to the end of the reign of Selim I (1520), is based on earlier works. Its reputation can be attributed partly to its rhetorical and ornate style, popular in the 16th century, and to the fact that the author's family were influential in the palace for nearly a century. (F. I.)

SÁ DE MIRANDA, FRANCISCO DE (1481–1558), the first of the Portuguese Renaissance poets, was probably born on Aug. 28, 1481, the illegitimate son of a canon of Coimbra, Gonçalo Mendes de Sá, and Dona Inês de Melo. He was made legitimate in 1490. He studied at the university, which was then in Lisbon, and seems to have lived mainly in the capital until 1521, frequenting the royal court and taking part in the poetical improvisations there and, possibly, teaching at the university. The years from 1521 to 1526 he spent in Italy, visiting Milan, Venice, Florence, Rome, Naples and Sicily. He made the acquaintance of Giovanni Ruccellai, Lattanzio Tolomei and Jacopo Sannazzaro; he met the illustrious Vittoria Colonna, a distant connection of his family, and in her house he probably talked with Cardinal Pietro Bembo and Ariosto, and perhaps met Machiavelli and Frahcesco Guicciardini. By the time he returned home in 1526 he had become familiar with Italian verse forms and metres: the sonnet and *canzone* of Petrarch, the tercet of Dante, the ottava rima of Ariosto, the eclogue in the manner of Sannazzaro, and Italian hendecasyllabic verse. He did not, however, abandon the short national metre, which he carried to perfection in his *Cartas* or epistles in verse.

His play *Os Estrangeiros*, written *c.* 1527, was the first Portuguese prose comedy in the classical manner, and he wrote another, *Os Vilhalpandos*, *c.* 1538 (published 1560). His *Cleópatra* (written *c.* 1550), of which only a dozen lines are extant, was probably the first Portuguese classical tragedy. About 1528 Sá de Miranda made his first attempt to introduce the new Renaissance forms of verse by writing in Spanish a *canzone* entitled *Fábula do Mondego*, and this was followed a year or two later by the eclogue *Alexo*.

About 1530, in which year he married, he left Lisbon finally and settled on his country estate in the Minho. It is in this later period that he produced his best work: the eclogue *Basto*, the *Cartas* and the satires, in which he shows himself a stern critic of contemporary society. Some of the sonnets of this period are admirable, combining a grave tenderness of feeling and refinement of thought with simplicity of expression. He died on his estate at Tapada probably in May 1558.

Sá de Miranda was the leader of a revolution in Portuguese literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. As well as introducing the poetic and dramatic forms and spirit of the Renaissance into Portugal, he made an austere stand against the growing materialism of his time.

Poesias de F. de Sá de Miranda was edited, with life, notes and glossary, by C. Michaëlis de Vasconcelos (1885); *Obras completas de F. de Sá de Miranda* was edited by M. Rodrigues Lapa, 2 vol. (1937).

Bibliography.—T. Braga, *Sá de Miranda e a Escola Italiana* (1896); C. Michaëlis de Vasconcelos, "Novos Estudos sobre Sá de Miranda" in the proceedings of the Lisbon *Academia das Ciências, Boletim da Segunda Classe*, vol. v (1912); Mendes dos Remédios, "As Comédias de Sá de Miranda" in *Miscelânea de estudos em honra de C. Michaëlis de Vasconcelos* (1933). (N. J. L.)

SA'DI (Musharif-ud-din) (*c.* 1184–*c.* 1291), Persian poet and prose writer, the author of two works, the *Bustan* ("Orchard") and *Gulistan* ("Rose Garden"), which came to be regarded as classics of Persian literature. He lost his father Muslih ud-din in early childhood; later he was sent to study in Baghdad at the renowned Nizamiya college where he acquired the traditional learning of Islam.

The unsettled conditions following the Mongol invasion of Persia, when, in the words of Sa'di, the world resembled "the curly hair of a Negro," led the poet to wander in many countries. He refers to his adventures in north Africa, central Asia and India; in Syria he was captured by the Franks and put to work in the trenches of the fortress of Tripoli. When he reappeared in his native Shiraz he was an elderly man. He dedicated the *Bustan* (1257) and the *Gulistan* (1258) to the local ruler (atabeg) Abu-Bakr ibn Sa'd. (His pen-name Sa'di was derived from the name Sa'd borne both by the father and the son of Abu-Bakr.) He seems to have spent the rest of his life in Shiraz, for his poems were dedicated to the later atabegs and governors, both heathen and Muslim, whom the Mongol *ilkhans*, established in Tabriz, sent to the province of Fars. References to contemporary events in Sa'di's works stop at about 1270.

That Sa'di produced his two greatest works so late in life and in such quick succession is not surprising. The material for them must have been collected and many of the poems written long before an opportunity for their publication occurred. The *Bustan* is entirely in verse (in the metre used in epic) and consists of stories aptly illustrating the standard virtues recommended to Muslims (justice, liberality, modesty, contentment), as well as of reflections on the behaviour of dervishes and their ecstatic practices.

The *Gulistan* is mainly in prose, and contains stories and personal recollections. The text is interspersed with a variety of charming little poems containing aphorisms, advice and humorous reflections. The morals preached in the *Gulistan* border on expediency; *e.g.*, a salutary lie is admitted to be preferable to a blunt truth. The fate of those who depend on the changeable moods of kings is contrasted with the freedom of the dervishes:

I am neither riding a camel, nor carrying a load like a camel; I am neither a lord of subjects, nor the slave of a potentate; grief for what there is or distress for what there is not do not trouble me; I draw my breath freely and thus spend my life.

For western students the *Bustan* and *Gulistan* have a special attraction, but Sa'di is also remembered as a great poet, the author of a number of masterly general odes portraying human experience and also of particular odes (such as the lament on the destruction of the caliphate by the Mongols in 1258), which have a great appeal for Persian readers. A special section of his complete works is in Arabic, but Arabs find some of his methods of expression strange.

The peculiar blend of human kindness, resignation and humour displayed in Sa'di's works, together with a tendency to avoid the hard dilemma, make him, to many, the most typical and lovable writer in the world of Iranian culture.

BIBLIOGRAPHY.—Best editions of the *Bustan* and *Gulistan* are by M. A. Furughi (1938). The first competent trans. of the *Gulistan* was by F. Gladwin (1806, reprinted 1928), followed by that of E. B. Eastwick (1852, reprinted 1880); partial trans. are by Sir Edwin Arnold (1899), Sir R. Burton (1928) and A. J. Arberry (1945). A good French trans. of the *Bustan* is by Barbier de Meynard (1880). Sir L. W. King trans. two series of the odes, the *Tayyibāt* (1919–21) and the *Badāyi'* (1925). A comprehensive bibliography is in H. Massé, *Biographie de Saadi* (1919). For a general appreciation *see* E. G. Browne, *A Literary History of Persia*, vol. ii (1928); A. J. Arberry, *Classical Persian Literature* (1958). Critical ed. of the *Gulistan* with Russian trans. by R. Aliyev (1960). (V. F. M.)

SADLER, MICHAEL THOMAS (1780–1835), English social reformer, politician, and a leader of the movement for factory reform, was born at Snelston, Derbyshire, on Jan. 3, 1780. While still young he became a Wesleyan Methodist and his religion turned him into a philanthropist. He started business in Leeds in 1800, importing Irish linens, and soon afterward turned to politics. A critic of Catholic emancipation, in 1828 he published a book *Ireland: its Evils and Their Remedies*. He was Tory M.P. for Newark-on-Trent (1829–30) and for Aldborough (1831–32). He contested the new Leeds seat in December 1832, after the passing of the Reform Bill, but was defeated by Thomas Babington (later Lord) Macaulay, who had already criticized his *Law of Population* (1830), a massive treatise attacking the theories of Thomas Malthus. In the Leeds election Sadler received a large amount of working class support, because, along with Richard Oastler, he had become an advocate of factory reform and of government intervention to regulate the hours of child labour and factory conditions in general. As parliamentary representative of the newly founded "short-time committees" in the north of England, which were agitating for shorter working hours, he had introduced a factory-reform bill in the House of Commons in 1831 and had subsequently acted as chairman of the select committee to which it was referred. While in Parliament he had also moved unsuccessfully for the establishment of a poor law system for Ireland (1830) and for legislation to better the condition of the agricultural poor in England (1831). He died in Belfast on July 29, 1835.

Sadler's Toryism had a strongly radical tinge, which was shared by other Tories in the north of England: it remained a powerful force among the factory operatives until the growth of Chartism (*q.v.*). (A. BRI.)

SADO, Japanese island of Niigata prefecture, 32 mi. W. of Niigata, the prefectural capital. Area 248 sq.mi., pop. (1960) 84,404. Sado, long known as an island of romance, is the home of *okesa* (folk-dancing songs, ballads). Camellia trees grow in abundance. The climate is mild all the year.

Sado was famous as a place of exile and among many statesmen and scholars banished two of the most exalted were the emperor Juntoku (1197–1242) and the Buddhist priest Nichiren (1222–1282). Sado is known for its gold and silver mines, continuously operated from 1601. Rice is the first product, followed by fishing. Tourism provides an important source of income. Ryōtsu, on the east shore, is the only city. It is the centre of the island's administration, and of its fishing industry. Serving as an outer port of Niigata, it is the principal port on the island. Aikawa is the largest town on the west coast. (R. B. H.)

SÁENZ, MANUELA (1797–1856), known throughout Latin America as "La Sáenz," mistress of the liberator Simón Bolívar, was born in Quito, Ecuador, on Dec. 27, 1797. At the time of her birth her mother was unwed, and the stain of illegitimacy left its mark. For years she shrouded her origins in mystery. In 1817 she married a British merchant, James Thorne, who took her to Lima, Peru; there Manuela first came into contact with the movement for independence which was then challenging Spanish rule throughout Latin America. On her return to Quito in 1822 she met Simón Bolívar, who had just completed the liberation of Ecuador. Manuela became the great passion of his life; she threw caution to the winds and united her life with his—and with the cause for which he was fighting.

The exigencies of war separated the couple for long periods, and there were occasions of neglect which Manuela bitterly resented. In return for her unflinching devotion she demanded an exclusiveness to which Bolívar was unaccustomed. When the war took Bolívar to Peru Manuela did not hesitate to follow him.

As she had shared the zenith of Bolívar's life, she also became engulfed in his decline. Her efforts to keep the Peruvians on his side were in vain. She was exiled from Lima and joined Bolívar in Bogotá, Colombia, where on Sept. 25, 1828, she saved him from conspirators.

In the spring of 1830, when Bolívar resigned his office to go into exile, Manuela was left behind. His papers remained in her care and she refused to hand them over to his enemies. When she learned of his death (Dec. 17, 1830) she unsuccessfully attempted to take her own life.

In 1834, Manuela was exiled from Bogotá and went to the small Peruvian port of Paita, where she made a living as a vendor of sweets and tobacco. She died at Paita on Nov. 23, 1856.

SÁENZ PEÑA, ROQUE (1851–1914), Argentine president and diplomat. Although a wealthy leader of the landed aristocracy, he was responsible during his presidency for a broad suffrage law, which placed Argentina in the vanguard of Latin-American democracy.

Sáenz Peña was born in Buenos Aires on March 19, 1851, the descendant of a famous family. He was educated in Argentina, traveled in Europe and entered politics in the 1870s, when Argentina's population and economy were rapidly expanding. Among the many posts he held were those of minister of foreign affairs, delegate to the first International Conference of American States (Washington, D.C., 1889–90) and ambassador to Spain and to Italy (1901–10). He was elected president in 1910 in a conservative-controlled election, but he had the vision to respond to the mounting demands of the popular majority, represented by Hipólito Irigoyen's Radical party, and forced a series of electoral reforms through the oligarchy-dominated congress. These laws, which have since borne his name and have been the basis of Argentine democracy, gave every Argentine male at the age of 18 the right to vote on a secret ballot.

Sáenz Peña died in office on Aug. 9, 1914, as Argentina was entering an era of change marked by World War I and the election to the presidency in 1916 of his former opponent, Irigoyen. (T. F. McG.)

SAFAD (SAFED), a town of Israel in the hills (2,600 ft. [800 m.]) of northern Galilee, lies 15 mi. (24 km.) NW of Lake Tiberias and 30 mi. ENE of Haifa. The population (10,586 at the 1961 census) is mainly Jewish. Safad is considered to be one of the four Jewish holy cities and has been identified with the "city set on a hill" (Matt. 5:14). It became the chief centre of Jewish learning after the expulsion of Jews from Spain (1492). The corpus of Jewish law was composed there (1542) and a modern school of the Cabala (mystic lore) flourished until the town was destroyed by earthquake in 1837. The first printing press in Palestine was set up in Safad (1563). The town was a stronghold of the crusaders during the Latin Kingdom and then of the Mamelukes.

Before the earthquake in the 19th century Safad was a considerable commercial centre. It is now a thriving tourist and pilgrimage centre; it has four historic synagogues. Main roads link it with Acre, Metulla, and Tiberias. (No. B.)

SAFARIK, PAVEL JOSEF (1795–1861), one of the leading figures of the Czech national revival and a pioneer of Slavonic philology and archaeology. Born at Kobeliarov, Slovakia, May 13, 1795, of a Protestant family, he studied at Jena and was director of the Serbian Orthodox grammar school at Novi Sad before settling in Prague in 1833. In 1841 he refused an invitation to occupy the chair of Slavonic philology at Berlin, preferring to remain as a private scholar in his own country. He died at Prague, June 26, 1861.

Erudition and scholarly integrity characterize a series of influential works on the history and languages of the Slavs: *Geschichte der slavischen Sprache und Literatur nach allen Mundarten* (1826); *Slovanské starožitnosti* (1837), better known in the German translation *Slawische Altertümer* (1843); *Über den Ursprung und die Heimat des Glagolitismus* (1858); *Geschichte der südslawischen Literatur* (1864).

Although his work on the origins and migrations of the Slavs has been superseded, it was of great value in its time. His philological works can still be read with profit: in his belief in the priority of the Glagolitic alphabet over the Cyrillic he was far ahead of his time. (R. Ay.)

SAFAVIDS (Safawids), the ruling dynasty of Iran from 1501 to 1736. The dynasty, founded by Shah Ismail I, was named after his ancestor, the saintly Sheikh Safi al-Din of Ardabil. After reaching its peak under Shah Abbas I the dynasty declined and was brought to an end by Nadir Shah in 1736. *See* Persian History.

SAFED KOH, a remarkable range of mountains on the northwest frontier of West Pakistan, extending like a 14,000-ft. wall, straight and rigid, towering above all surrounding hills. It separates the Kabul basin from the Kurram and Afridi Tirah and thus forms a natural boundary between Afghanistan and Pakistan. The highest peak, Sikaram, is 15,600 ft. above sea level. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul River, which cuts a deep waterway where it makes its way from Dakka into the Peshawar plain. The northern spurs are extremely barren but the intervening valleys support agriculture and gardens abounding in mulberries, pomegranates, etc. The main range and the upper portions of the spurs are wooded with pine and deodar.

The same name is often used for the mountain range north of the Hari Rud River in its upper course.

SAFES, STRONG ROOMS, AND VAULTS. From earliest times various devices have been used to protect valued objects from fire and flood, as well as from the common menace of thieves. Safekeeping measures—which range from burying treasure to installing electronic safety devices—provide a fascinating story in man's attempt to protect his possessions.

Historical Background.—In ancient Egypt, Greece, and Rome the function of the modern safe was served by massive chests (*see* Cabinet Furniture). Homer tells of wooden coffers that were used for storing valuable clothes as well as gold and silver. In the 7th century B.C., one of the boasted possessions of Cypselus, tyrant of Corinth, was a cedar treasure chest inlaid with gold and ivory.

The Roman treasure chest (*arca*) was a large coffer made of iron or of wood reinforced with iron or bronze bands and equipped with a padlock. A proscribed citizen is said to have hidden for several days in an *arca* belonging to one of his freedmen. The *arca* usually stood in the atrium of the house, in care of the porter or a servant, called *arcarius,* who was assigned to make disbursements. Some Roman houses were also equipped with vaulted underground storage rooms.

Greek and Roman temple treasures were stored in strong rooms which were sometimes used also as repositories for the state's tax money or for private treasures. The public treasury of Rome was maintained for centuries, under both the republic and the empire, in a cavity in the great mass of concrete that underlay the floor of the Temple of Saturn and Ops. In some Greek temples, including the Parthenon, a special chamber was divided from the main storeroom as a repository for temple treasures and for citizens' property left there for safekeeping.

In medieval times the treasures of bankers and feudal lords were usually stored in chests in underground rooms, sometimes further protected by armed guards. In Renaissance Europe, huge, often beautifully decorated, iron chests, fitted with cumbersome and elaborate locks, were widely used. These were succeeded by the drab iron boxes that were characteristic of commercial life in the era of the Industrial Revolution.

Various attempts at fireproofing chests, none very effective, were made early in the 19th century. In 1801 Richard Scott was granted a British patent for a fireproof chest, but this does not appear to have been manufactured. About 1820 a French manufacturer produced a portable metal box with double walls, the space between which was filled with heat-resistant material. In 1826 a supposedly fireproof safe, patented by J. Delano, was produced in New England. It was composed of oaken planks saturated with brine or an alkali and covered with thin sheets of iron reinforced by riveted iron bands. Many of these were destroyed in the disastrous New York fire of 1835. In 1830 Thomas Milner began producing tinplate and sheet-iron boxes in Liverpool, Eng., and as his business grew he became a manufacturer of prototypes of the modern safe.

A British patent for a chest lined with nonconducting material was issued to William Marr in 1834. A safe utilizing plaster of paris as the nonconductor was produced by Daniel Fitzgerald of New York City in 1843. The improvement in fire resistance thus effected was offset by the corrosive action of the filler, which destroyed the protective value of the iron plates within a few years.

In mid-19th century, thousands of merchants in Britain and the U.S. were keeping their cash in iron safes. Many of these contained an inner shell slightly smaller than the outer one, with the intervening space stuffed with such insulating materials as ferromanganese, marble dust, or burned clay. Later, a cement and water mixture came into general use for insulation, the water creating a protective blanket of steam between the heat of a fire and the objects in the safe.

These key-lock chests offered slight protection against burglary, since the keys could be duplicated and the locks jimmied. A combination lock, introduced in the U.S. in 1862 by Linus Yale, Jr., represented a temporary improvement, but skilful burglars learned to manipulate the combinations, and it was not until 1947 that a method of preventing this was developed (*see* also Lock). The problem of burglary caused the introduction of high-carbon steel, heavier plating, and stronger combination spindles.

The prototype of the modern safe-deposit vault was installed in 1865 in New York City. In 1874 a time lock was installed in a vault in Morrison, Ill., and time locks gradually came into general use in banks.

Many safes and their contents survived the Chicago fire of 1871, even after falling from considerable heights through fire-ravaged buildings. However, in many cases, in this and other fires, the metal shells of safes and their supporting bands warped, allowing heat to enter; manufacturers learned to be cautious about using the term "fireproof." In 1917 tests measuring the degree of protection against fire afforded by safes uncovered a number of basic weaknesses that were later corrected. For example, the water on which the manufacturers had relied for the protective action of steam might have evaporated before it was needed. It was found also that the sudden heat changes of a fire could cause explosion. In the half-century of evolution after the first tests, new construction methods brought great improvements. For example, the moisture needed for insulation was stored in the form of crystals that yielded water, then steam, when exposed to great heat. Two basic methods of construction were developed to provide effective insulation—the safe was cast as a single oven-dried unit, with the metal shell built around it, or the metal shell was formed first and the insulation mixture poured into it. In

either case, the fittings in the door and jamb that had tended to communicate heat were eliminated.

Modern Safes.—One of the methods used by burglars to force safes was to knock off the combination lock and drive out the spindle. A device to combat this is a relocking mechanism that operates automatically when the lock is jarred by cutting tools or explosives, throwing an emergency bolt—in some cases two or three bolts—into action.

A new alloy, containing solid hardened particles introduced into the metal in its molten state, is used to cover the door and front of a safe, offering protection against pressure-applied carbide cutting tools, which could penetrate the case-hardened steel of earlier models. The alternation of soft and hard layers in this protective coat causes sufficient stress to chip or shatter a drill. A device to defeat the acetylene torch is a front layer of copper supplemented by an inner ring of copper surrounding the inside of the door opening. The high thermal conductivity of copper tends to dissipate the heat before the entire plate can be heated to the fusing point, and its ductility makes it resistant to the impact of explosives. As a further protection for some models, the body of the safe is encased in a steel-clad cement block.

In the U.S. a manual of the National Stationery and Office Equipment Association divides safes into three categories. The type commonly referred to merely as a safe is designed primarily for protection against fire. The type built for protection against experienced burglars is called a money chest. The third type, insulated against heat and containing a built-in money chest, is termed a combination safe and money chest. Models in each category provide varying degrees of tested protection. For example, a two-hour safe is one that has been exposed in a furnace to temperatures up to 1,850° F (1,010° C) for two hours without damage to the papers stored in it, has survived without rupture for one-half hour in a test furnace preheated to 2,000°, and has survived intact a 30-ft. fall within two minutes after the fire was extinguished. Specifications of this type carry the certification of the Safe Manufacturers National Association and of the Underwriters' Laboratories.

Modern Vaults, Strong Rooms, and File Rooms.—The term vault, which once signified a room with a vaulted ceiling, generally denotes a below ground room that has been reinforced for the safekeeping of valuables. Other rooms built for this purpose are usually designated as strong rooms. However, "vault" is sometimes used in the sense of any room designed for the protection of valuables.

Various types of bank vaults and strong rooms are designed to protect records, cash, securities, or other valuable items against fire, water, burglary, and mob violence. Money vaults usually have concrete walls, floors, and ceilings, with inner coverings of steel plates. The concrete itself is sometimes reinforced with vertical and horizontal steel rods. The concrete and steel may be three feet thick.

Specifications for the construction of vaults and strong rooms are usually drawn up by architects and engineers. Doors have been standardized to fit most ordinary requirements, however, and the rooms are sometimes constructed according to specifications provided by manufacturers. A vault door designed to meet typical needs is 3½ in. thick, constructed of layers of high-carbon steel, copper, and hardened drill-resistant steel.

Vault doors are classified by the Underwriters' Laboratories according to their fire resistance. To determine this, the door is installed in the opening of a chamber facing a test furnace and subjected to the heat of the furnace for a specified time. A stream of water is then played on the door for one minute, and the exposure to the furnace is repeated. The tests are made in accordance with a time-temperature curve based on fire reports, which indicates that the typical fire reaches a temperature of 1,700° F (927° C) after one hour and 2,150° (1177°) after six hours. On the basis of satisfactory performance in the tests, the doors are given two-, four-, or six-hour fire classification labels.

The fact that a building is itself fireproof offers no guarantee that its contents will not be destroyed by fire; insurance companies report that documents in ordinary metal files can be counted on to survive typical office fires for only three to five minutes. Accordingly, insulated doors have been designed to retard the spreading of fire to rooms used for storage of files and records. Fire-insulated file-room doors have ratings of one-half hour and one hour. For additional protection, file rooms are equipped with heat-resistant filing cabinets.

Among burglar-alarm systems for the protection of vaults and strong rooms is a device that works on the principle of radar—a sound-wave transmitter that is set after business hours to send out waves of ultrasonic frequency. Any movement by an intruder distorts the wave reaching the ultrasonic receiver and triggers an alarm that may be audible on the premises or only to the police. Another system utilizes a network of wires embedded in the walls and so arranged that any chipping of the wall sets off an alarm. Another device sets off jets of live steam if an intruder reaches the interior of the room.

Burglars have been known to kidnap bank officials and force them to work the combination of a bank safe at the time for which its lock had been set. To combat this, the combination locks of safes and vault doors can be fitted with a device by which a simple manipulation of the dial touches off an alarm that is heard only at police headquarters. Another protective device enables a person locked inside a vault to open the door.

After the atomic attack on Hiroshima, Jap., U.S. manufacturers who had installed vaults in bank buildings there learned that the vaults had survived with their contents intact. In one case, that of the Teikoku Bank, the centre of the bomb's destruction was located about 300 yds. away, demolishing all of the building except the front walls. The vault door, which was only superficially damaged, was six inches thick—a fraction of the thickness of some vault doors. No vault, however, would be impervious to destruction by explosion of a hydrogen bomb without additional shielding. At Hudson, N.Y., 125 mi. from New York City, is a vault hewn from iron-bearing rock on several levels of a mountainside, with 1,500 ft. of flanking passageways. Great quantities of microfilmed business records have been stored in it, as well as motion-picture film, valuable works of art, etc. The vault is air conditioned, humidity controlled, and equipped with emergency supplies of food and water. Another such installation is located on an estate 42 mi. from Boston, designed to protect the records of the member and associate banks of the Boston Clearing House Association.

SAFETY is concerned with the taking of precautions against bodily injury caused by accident, either by preventing the occurrence or by mitigating its effect. Safety operates in two broad categories, occupational safety and public safety. The former covers hazards of employment, *e.g.*, in factories, offices, and shops and on farms and building sites; the latter deals with exposure to risk at all other times, as at home, during recreation, or while traveling.

In ancient times a fatalistic view of accidents prevailed, and the preventive measures occasionally advocated by medical men and humanitarians were largely ignored. The awakening of the public conscience to the need for protecting human life from accidental injury sprang from the inhumane conditions of employment in the early stages of the Industrial Revolution. Therefore, in all industrialized countries, the early 19th century saw the start of legislation for the protection of workers. Legislation of this kind has been expanded continuously either to deal with new industrial processes or to increase coverage for ever wider ranges of employees.

However, it is not only in the factory that modern man has created hazards for himself. The farm tractor, the labour-saving appliances in the home, the boats and guns for sport, and countless other inventions—above all, the motor vehicle—all take their toll of life and limb. The problem of the 20th century is to keep safety provisions in pace with the swiftness of technological advance and the resultant stresses on mind and body—as is particularly clear in motoring. Each year there is improvement in car performance, with ever higher cruising speeds and parallel improvement in roadholding and braking. The drivers, however, have no better capabilities; they are assumed to be able to condi-

tion themselves to the higher speeds at their disposal.

Investigation shows that nearly all accidents are caused by human failure involving at least one (usually more than one) act of commission or omission by an individual. Most accidents could have been avoided had any of the persons concerned acted differently.

Accident Statistics.—Road accidents account for one-third or more of fatalities in a country with a highly developed motor transportation system. Home fatalities are comparably numerous. In the United States, recreational pursuits account for over 6,000 deaths yearly; and in the United Kingdom, accidental drownings alone number around 1,000 a year. The number of occupational fatalities varies greatly from country to country owing to the differing nature and size of their industries. For example, average annual fatalities at work in the United States total 13,500, of which no fewer than 3,500 occur in farm work; whereas the United Kingdom's yearly total of 1,300 killed at work includes only 150 in its proportionately smaller agricultural industry.

Care must be taken to avoid making unfair comparisons between the safety records of various countries. Absolute figures mean little without relation to the number of persons at risk and the duration of their exposure to risk. Road-death rates are usually compiled in relation either to number of vehicles licensed or to number of population; although, clearly, rates per million vehicle-miles would be more useful and rates per million vehicle-occupant-miles better still. Even then, in order to arrive at a fair comparison of safety records, it would still be necessary to know the densities of traffic in the respective countries and the relative incidence of accidents on urban and rural roads. For example, in the U.S. there are about five fatalities on rural roads for every two on urban roads; whereas in Great Britain the ratio is about three on urban roads to two on rural roads. This difficulty in drawing conclusions from international fatality figures is even greater in the case of injury statistics. Injuries can range from a minor bruise to a permanent total disability; which makes simple categorization by severity difficult between separate fields of activity, *e.g.*, roads and industry, even within one country. Accident statistics, therefore, are usable only in comparing changes in safety performance within a unit, (such as a factory, an accident-prevention organization, or a nation) which maintains its records on a clearly defined basis.

It may be assumed from U.S. and British experience that the number of persons injured seriously enough to require admission to hospital is approximately ten times the number of those killed; and that accidents are the greatest single killers in the age group 1–34 years. Humanitarian considerations apart, the drain on the economic life of every nation is obvious.

Measures of Prevention make use of three approaches known to safety workers as the three "E's"—Engineering, Enforcement, and Education.

Engineering embraces matters of design, layout, and construction that have a bearing on the creation of a safe environment. In the factory, it covers the production process itself; *e.g.*, working conditions can be improved by substituting nontoxic for toxic substances within the process. The most opportune time to ensure a safe environment, however, is at the preliminary stage of designing the building, machinery, and production routines. Engineering's part in road safety is obvious, as witness the rising importance of traffic engineering on the one hand and of safe vehicle and accessory design on the other. In the home, engineering ideally covers the safe design of the house itself (with particular regard to the frailties of the very young and the very old), and also that of all the tools of housekeeping, from electrical appliances to can openers.

Enforcement refers not merely to enforcement of safety laws by the police but to the legislation itself, including factory safety rules as a condition of employment.

Education, in its safety connotation, covers methods of teaching the public to avoid accidents. It includes instruction in schools and on the job, training schemes (*e.g.*, courses for drivers, industrial managers, voluntary safety workers), conferences, and campaigns that use mass publicity media.

Application of Safety Methods.—The effectiveness of each of the three approaches varies according to the acccident-producing situation. Thus, voluntary safety organizations, whose role is primarily that of education, are affected by engineering and enforcement work, since these two methods provide the background against which they operate.

Industrial Safety.—In modern industry it is accepted that management must provide a safe workplace and working system. The tendency in western Europe and Great Britain is to enforce this by comprehensive legislation; in the U.S. there is more reliance on education of personnel. However, the end result has been much the same, since enlightened firms have always gone beyond current legislation, which tends to lag behind the most up-to-date industrial techniques, and, in any case, cannot make enactments against human failure. Unguarded machinery has long ceased to be the major cause of factory accidents. There is, however, still a wide gap between the safety performances of the enlightened and of the laggard firms in each industry.

In most countries, employees have effective rights under common law or workmen's compensation laws in case of accident, even should the blame be partly theirs. The resultant increase in compensation awards is rapidly reflected in the rising insurance contributions for employer's liability which firms have to pay. More and more firms, therefore, are operating safety programs, employing trained safety staffs to act as advisers to line management. Such firms, should an accident occur, regard the subsequent investigation not as a means of apportioning blame but as a means of preventing further accidents. The chain of causation will be examined, considering first the possibility of failure of design, then that of failure of supervision, and only lastly personal failure on the part of the operative.

Agricultural Safety.—Farming has its special problems. The isolation, in many countries, of the agricultural community and of farmers at their work, and the difficulty of adequately guarding farm machinery, weaken the enforcement weapon and hinder educational efforts. Nevertheless, since World War II safety regulations have been widely introduced.

Road Safety.—Controversy over road safety stems from the lack of comprehensive research into the causes of road accidents and from the ease with which road-accident statistics can be interpreted to suit the case of a particular theorist. There is agreement, however, on the safety value of the modern high-speed limited-access road (expressway or throughway) and of the ordinary dual highway. But in towns, and in small countries where land is scarce, the engineering solution tends to be too long-term for such a pressing problem. So recourse is had everywhere to enforcement as an immediate remedy. The trouble, however, is that most accidents are caused not by a criminally selfish minority against whom law is the only sanction, but by the unskilled and unimaginative, who comprise the majority of motorists: hence the vital need for driver education.

The pedestrian and the cyclist also contribute sizably to the accident situation. The best remedy, that of complete segregation of these categories of road user from motor vehicle traffic, is being pursued in the design of new towns. Meanwhile, many countries have regulations for the control of pedestrians in certain areas, requiring them to use specially marked crossing places and to observe traffic signals.

Public Transport Passenger Safety.—Owing to stringent regulations, accidents to passengers in air, rail, and sea transportation form only a very small fraction of the total accidents in any country. Buses are more vulnerable than aircraft, trains, and ships, since they face all the risks of the road.

Home Safety.—Although direct enforcement can hardly be applied to the occupants of the home, legislation regarding the engineering of a house and its fittings is important. Most countries have laws providing measures of safety for the consumer; *e.g.*, laws covering the labeling of flammable liquids, sale of poisons, design of appliances, and standards of electric wiring. However, home hazards are so numerous and varied that the role of education is as vital here as on the roads. Recreational safety, although in a sense an aspect of home safety, is increasingly considered in

its own right; here education assumes the form of training in the taking of considered risks.

Organization of Safety Work.—In many countries national voluntary bodies exist for education in safety work. The majority confine themselves either to occupational safety or to road safety; only a few are concerned with safety in general. This is because (1) in those countries with little industry the most immediate requirement has been a road safety organization; (2) finance is a difficulty, particularly where government aid is involved. Hence, overall safety bodies have usually resulted from a merger of separate entities. Admittedly, with specialist bodies all effort can be concentrated on one objective. On the other hand, comprehensive organizations can obtain wider and more influential support; their scope for public relations is greater; and their overheads can be spread and they can support activities, such as home and recreational safety, which might otherwise be neglected completely through lack of money.

Whatever the pros and cons of organizing safety on an all-embracing basis at the national level, at the local level there is everything to be said for specialist groups and safety workers. Of this sort are police and motoring organizations with their concern for road safety; and medical officers of health, health visitors, and firemen, who have a special interest in home safety.

Safety organizations carry out their work by securing the cooperation and support of the public. Members of safety committees both advise and promulgate decisions, either through their organizations or directly. The effectiveness of a safety association lies in the degree of its cooperation with the public, more particularly road-user groups, employers' federations, trade unions, educators, the armed services, central and local government representatives, and the first aid, lifesaving, and medical authorities. There is liaison with the professional safety institutions, such as the American Society of Safety Engineers in the U.S. and the Institution of Industrial Safety Officers in the U.K., and also with the bodies which lay down national safety standards of design.

National Organizations.—The National Safety Council (United States) is the world's largest safety organization. Formed in 1913 as the National Council for Industrial Safety in the United States, in 1914 it enlarged its scope to include traffic safety and adopted its present title, subsequently extending its activities to all safety fields. Each field is served by a department under the direction of a permanent committee; a board of directors exercises general control. The council is financed primarily by subscriptions and by sales of its publications; it also accepts donations through its trustees.

Throughout the U.S., state and local safety councils have been established which, although autonomous, are accredited by the National Safety Council provided they meet its standards of performance. Over 60% of the population is served by such accredited councils. The national council's staff of field service officers helps to achieve uniformity of performance.

In Great Britain, the Royal Society for the Prevention of Accidents (RoSPA), with headquarters in London, is a comprehensive safety organization somewhat like the National Safety Council. It began in 1916 as the London "Safety First" Council. In 1923 it became the National "Safety First" Association by merging with the British Industrial "Safety First" Association of 1918. In 1941 it received its current title under the patronage of King George VI. Its funds are derived from sources similar to those of the National Safety Council, but the cost of its 12 regional road safety offices and their staff is met by the government, which also gives some support to the society's home and agricultural safety activities.

Throughout the U.K., road, home, industrial, and agricultural safety are separately organized by local committees, the first two by local government authorities in the towns and rural areas and the last two by the communities concerned. RoSPA coordinates their work through regional bodies. Internationally known is the society's road safety training centre and exhibition in London, largely financed by local authorities in and around London, and attended by some 50,000 people every year, ranging from schoolchildren to commercial drivers.

All national safety organizations perform a similar educational role within their countries. The facilities at the disposal of the organizations, however, vary according to the funds available. In some countries where there is a government-controlled workmen's compensation fund, the industrial safety organization receives a percentage of the income of this fund to cover its operations. Likewise, in some countries where road-accident insurance is centralized, the road safety organization receives direct financial support.

International Organizations.—National safety associations cooperate through international safety organizations and conferences. Since 1955, world congresses on the prevention of occupational accidents and diseases have been held at three-year intervals. Participation is organized locally by the appropriate national safety body, with the help of the International Social Security Association (ISSA) and the International Labour Organization (ILO). The Permanent International Association of Road Congresses, supported by the ministries of transport of constituent countries and by organizations connected with road construction, holds congresses every four years on subjects which include engineering aspects of safety.

An international road safety congress, held every other year by the World Touring and Automobile Organization (OTA), is organized in collaboration with the International Federation of Senior Police Officers and the Prévention Routière Internationale. This last is an international road safety body based on the Prévention Routière Française in Paris; its membership includes the road safety organizations of Austria, Belgium, Chile, France, Ireland, West Germany, Greece, Israel, Italy, Morocco, Luxembourg, the Netherlands, the province of Quebec (Canada), Switzerland, and the United Kingdom.

In addition to these regular international conferences (and those called at longer intervals, *e.g.*, the International Conference on Alcohol and Road Traffic) there are the annual safety conferences of the major national bodies, which foreign visitors attend.

The International Occupational Safety and Health Information Centre was founded in 1957 in Geneva by the ILO in collaboration with the ISSA, with the support of the European Coal and Steel Community, the European Economic Community, and the World Health Organization. Specialized national institutions in 25 countries also participated. The centre provides information on accident prevention and health protection by means of abstracts from a wide range of safety literature.

The International Organization for Standardization, constituted in 1946 in Geneva, has 50 member countries; France, the U.K., the U.S., and the U.S.S.R. are permanently represented in its council. In addition to representatives of national standards organizations, nominees of safety organizations serve on those of its committees that recommend safety standards. Topics considered include safety codes, safety in the nuclear energy field, and personal equipment and clothing.

SAFETY GLASS: *see* GLASS MANUFACTURE: *Safety Glass.*

SAFETY LAMP. Toward the end of the 18th century coal mine explosions became increasingly common as the seams were dug to deeper levels where firedamp (methane gas) was more prevalent, and efforts were made to devise means of lighting which would be safe in the presence of the gas. The explosive nature of a cloud of fine coal dust was not then recognized, and explosions were attributed wholly to gas. The explosions usually originated at the flame of a tallow candle.

Davy Lamp.—W. Reid Clanny invented a form of lamp in 1813 in which the external air was blown by bellows through a small

cistern of water and the products of combustion forced through a similar water seal. George Stephenson, who was experimenting with lamps for underground use in 1815, concluded that "if a lamp could be made to contain the burnt air above the flame, and permit the firedamp to come in below in small quantity to be burnt as it came in, the burnt air would prevent the passing of the explosion upwards and the velocity of the current from below would also prevent its passing downwards." Though neither type of lamp was satisfactory, some of the ideas of Clanny and Stephenson were incorporated in the Davy lamp as the latter was developed and improved. In Aug. 1815 the Sunderland Society of the Prevention of Accidents in Mines interested Sir Humphry Davy in the problem of mine explosion, and by the end of that year the first Davy lamp was ready for testing.

Although many others worked along the same lines, his name is more generally known as the inventor of a relatively safe oil-burning lamp. He demonstrated the fact that a metal gauze having 28 openings to the linear inch would cool the products of combustion so that the heat of the flame would not ignite inflammable gas on the other side of the gauze. In order to avoid danger resulting from failure of a single gauze cylinder surrounding the flame, he found it necessary to use two concentric cylinders, one slightly smaller than the other. The lower edges fit snugly to the bowl containing the fuel; the upper ends of the cylinders were, of course, covered by disks of similar gauze. In the hands of a careful person, the Davy lamp could be used safely, but it could not be used in a strong air current because of the danger of passage of the flame through the gauze.

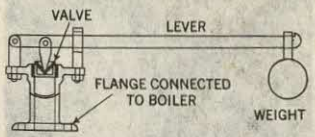
Electric Lamps.—Portable electric hand lamps and cap lamps were introduced in coal mines in the early 1900s, but their weight and cost retarded their widespread adoption until after World War I. By mid-20th century, however, portable electric cap lamps were used almost exclusively by miners in both coal and metal mines. The headpiece on the cap, attached by flexible rubber-insulated cable to the battery on the belt of the wearer, furnishes the miner with a powerful beam of light directed at the work in hand. Batteries use either an alkaline or acid solution and are recharged between working shifts to maintain almost constant illumination for eight hours or more. In the headpiece, there is a safety device that shuts off the electric current if the bulb or bulbs are broken. A single bulb may be fitted with two filaments. If one burns out, a switch may be turned to bring the other into use with no loss of time.

While the electric cap lamp gives excellent illumination, it is completely independent of the surrounding air. Therefore, it gives no warning of noxious gases or lack of oxygen. Consequently, a flame safety lamp must be kept burning within easy reach of the workers or frequent inspections must be made by an official, using a flame safety lamp or other form of detector. When the flame safety lamp is placed in an atmosphere containing firedamp the flame elongates, and if the gas is present in considerable quantity the lamp is filled with blue flame. For testing the presence of gas the flame of the lamp is lowered until the yellow part is at a minimum, when the gas will be discernible as a small blue cap to the flame. U.S. usage, based on federal and state laws, recommend that a minimum of two flame safety lamps in good operating condition be available at all mines for testing the presence of methane or oxygen deficiency. Specifications require that each lamp be equipped with double steel or brass gauzes constructed of wire between 29 and 27 American wire gauge (0.0113 to 0.014 in. in diameter), with mesh openings from 28 to 30 per lineal inch. There should be a shield or bonnet so constructed as to prevent injury to the gauzes and shield the gauzes from strong air currents. Lamp locks should be of the magnetic type and the relighting device simple and safe to use in the presence of flammable gas.

The statutory regulations governing the manufacture and use of safety lamps vary slightly from country to country but are alike in substance. In addition to portable safety lamps, electric lighting from power mains may be allowed underground provided adequate safety features are incorporated in the design of the lighting fixtures, and care is exercised in their installation. *See* also Coal and Coal Mining: *Hazards of Mining.* (M. D. Cr.)

SAFETY RAZOR: *see* Razor.

SAFETY VALVE is a valve which lifts at a predetermined pressure and "lets off steam," thus preventing the accumulation of a dangerous pressure in a steam boiler or hydraulic system. The resistance to pressure is provided by a weight or by springs, the use of the latter being obligatory if the boiler is not a stationary one. The lever valve (*see* diagram) is loaded with a weight at the end, to keep the valve shut. A casing with lock may be fitted over the device to prevent tampering by an unauthorized person. Many boilers carry two safety valves as a precaution, one being locked up. Marine boiler valves are of the direct spring-loaded type, the spring encircling the valve spindle. The pop valve blows off sharply with a pop, and is used for yacht and launch boilers. The valve closes again quickly when the pressure has been slightly reduced.



SCHEMATIC DIAGRAM OF SAFETY VALVE ON STEAM BOILER

SAFFARIDS, a Persian dynasty of the 9th century, founded *c.* A.D. 866 by Yaqub ibn al-Layth al-Saffar ("the Coppersmith"), who gained command of a body of local troops and took control of his native province of Seistan. He soon added the Kabul Valley, Sind, Makran, Kerman, Fars, and Bactria to his possessions. In 873 he seized Khurasan, Tabaristan, and neighbouring territories. Finally in 876 he was defeated by the caliph's army when marching on Baghdad. He died in 879 and was succeeded by his brother Amr, who was declared by the caliph viceroy of Khurasan, Isfahan, Fars, Seistan, and Sind. In 900 he was defeated near Balkh by Ismail, the Samanid. Thereafter few of the later Saffarids had any wide authority, though they maintained their position in Seistan intermittently for more than two centuries.

See V. V. Barthold, *Turkestan Down to the Mongol Invasion,* 2nd ed. (1959).

SAFFLOWER, the common name for *Carthamus tinctorius,* a flowering annual plant of the composite family (Compositae), and native to mountainous areas of southwest Asia and of Ethiopia. It grows from one to three feet high, and is characterized by orange-red blossoms.

It was important at one time as a source of a red textile dye called carthamin, obtained from the dried flowers. Carthamin was replaced by synthetic aniline dyes, except in local areas of southwest Asia. Occasionally it has been an adulterant of saffron (*q.v.*). Safflower is grown now primarily for the oil obtained from the seed, the oil being used mainly in salad and cooking oils. Although safflower oil has been promoted commercially as a regulator of blood cholesterol levels, the medical results have been inconclusive. The meal or cake residue is used as a protein supplement for dairy cows, beef cattle, and sheep.

The plant is grown chiefly in India. It has been introduced as an oil crop to the United States, Australia, Israel, Turkey, and Canada. It requires a growing season of 120 days or more and dry atmospheres after the appearance of the buds.

See P. F. Knowles, "Safflower: Production, Processing and Utilization" in *Economic Botany,* vol. 9 (1955). (P. F. K.; X.)

SAFFRON, the orange powdered product manufactured from the dried stigmas and part of the style of the saffron crocus (*Crocus sativus*). The purple flower, which blooms late in the autumn, is very similar to that of the common spring crocus. The conspicuous protruding stigmas are of a characteristic orange colour; the fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower (*Carthamus tinctorius;* often used to adulterate saffron), do not seem to have possessed the true saffron, but it is named in Songs of Solomon 4:14 among other sweet-smelling herbs. It is also mentioned by Homer and Hippocrates.

The saffron crocus has long been cultivated in Iran and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun tsaou,* 1552–78). The chief seat of cultivation in early times, however, was in Cilicia, in Asia Minor. It was cultivated by the Arabs in Spain about 961, and is mentioned in an English leechbook of the 10th century, but seems to have disappeared from

Western Europe until reintroduced by the crusaders. According to Hakluyt, it was taken to England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Histon in Cambridgeshire and in Essex at Saffron Walden (*q.v.*), its cultivators being called "crokers."

ROCHE

SAFFRON CROCUS (CROCUS SATIVUS)

As a perfume, saffron was strewn in Greek halls, courts, and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city. It was a royal colour in early Greek times, though afterward, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetaeriae, professional female entertainers of the time.

Saffron was used as an ingredient in many of the complicated medicines of early times. That it was much used in cookery and as a dye is evidenced by many writers. It is no longer used as a fabric dye, since it is water soluble, but is used for colouring foods, to which it imparts a characteristic subtle flavour.

Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines, and in Iran and Kashmir. It occurs in the form of cake saffron, which consists of the stigmas and part of the style, which have been "sweated" and pressed together into a cake, and also as hay saffron, which consists of the dried stigmas alone.

SAFFRON WALDEN, a market town and municipal borough in the Saffron Walden parliamentary division of Essex, Eng., 27 mi. NNW of Chelmsford by road. Pop. (1961) 7,817. Area 11.7 sq.mi. Of the old castle, dating probably from the 12th century, the keep and a few other portions still remain. Near it is a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; a large Saxon burial ground was there. The large church of St. Mary the Virgin contains the tomb of Lord Audley, chancellor to Henry VIII. The town has a museum with good archaeological and natural history collections. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136.

The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII, the lord of the town, in 1513. It was dissolved under Edward VI, and a charter was obtained appointing a treasurer and chamberlain and 24 assistants, who, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III until its gradual extinction about 1768; market gardening is now the main industry.

SAFI (Asfi), a port on the west coast of Morocco south of Cape Cantin about 105 mi. (170 km.) NW of Marrakesh City by road. It is the chief town of the Abda-Ahmar region. Pop. (1960) 81,072. In the 13th century, it was a *ribat* (fortress of the holy war). The Portuguese occupied it from 1508 till 1541, and built a citadel (kechla), which included a castle at the edge of the sea, and repaired the ancient kasbah. These fortifications still exist. Safi was formerly headquarters of a province of 270,000 inhabitants, but following an administrative reorganization after Morocco's independence it became part of Marrakesh Province (*q.v.*). On Nov. 8, 1942, Safi was one of the points at which the American forces landed.

The port is connected by rail to the phosphates centre of Youssoufia (formerly Louis-Gentil) of which it exports the entire output. It is also the chief sardine port of Morocco and the site of an important canning industry. (A. Am.)

SAFID RUD, the longest river of northern Iran, flows into the Caspian Sea. With its main tributary, the Qezel Owzan (Qizil Uzun), the Safid Rud has an approximate length of 487 mi. (785 km.) and a total drainage area of 21,700 sq.mi. (56,200 sq.km.). It is formed by the union of its tributaries Qezel Owzan and Shahrud near Manjil at an elevation of 920 ft. (280 m.); it at once breaks through the Elburz Mountains, in an impressive gorge 23 mi. (37 km.) long, to emerge on the plain of Gilan (*q.v.*), where it forms a delta. Heavy floods and frequent changes of course—six major changes between the mid-19th and mid-20th centuries—have wrought havoc upon the dense population of the delta. A dam completed in 1962 at Manjil at the upper end of the gorge was designed to prevent floods, improve and extend irrigation, and provide electric power. The average discharge of the Safid Rud at the town of Rudbar was calculated in the mid-1950s as 22,900 cu.ft. (651 cu.m.) per sec., with an average daily maximum of 32,666 (925) in April–May, but only 1,328 (37.6) in August-September. (H. Bo.)

SAFIYE SULTAN (fl. *c.* A.D. 1600), the favourite consort of the Ottoman sultan Murad III (reigned 1574–95) and the mother of his son Mohammed III (1595–1603), who exercised a strong influence on Ottoman affairs during the reigns of both sultans. Her name Safiye signifies "the pure one." She has often been confused with Nur Banu, the wife of Sultan Selim II (1566-74) and mother of Murad III, who descended from the Venetian house of Venier-Baffo. Safiye Sultan is said, in the *Ottomanno* of the well-informed Venetian L. Soranzo, whose book appeared at Ferrara in 1599, to have been a native of Rezi, a mountain town in Albania. Until the death, in 1583, of Nur Banu, the *valide sultan* (mother of the sultan on the throne), her influence over the conduct of affairs was circumscribed. Thereafter, as *khasseki sultan, i.e.*, mother of the heir to the throne, Mohammed, and, after 1595, as *valide sultan* during the reign of her son, she wielded great influence at the Ottoman court. Of those who enjoyed her favour, mention can be made here of Ibrahim Pasha (d. 1601), three times grand vizier in the reign of Mohammed III. Safiye Sultan is said to have shown herself favourable, during the years of her greatest influence, to the interests of Venice at the Ottoman Porte. Sent into retirement on the death of her son Mohammed III in 1603, Safiye Sultan died in 1605 according to some authorities and according to others not until 1619. A mosque at Cairo, the Malika Safiye, bears her name. She also began in 1597–98 (or 1614, according to some authorities) the construction at Istanbul of a mosque which, at first left unfinished, was later completed in the reign of Sultan Mohammed IV (1648–87) to become the Yeni Valide Camii. (V. J. P.)

SAGA, a prefecture (*ken*) in northern Kyushu, Japan, and also the name of the capital of the prefecture. The *ken* has an area of 927.76 sq.mi. (2,403 sq.km.) and a population (1960) of 942,874. Within it is the Tsukushi plain, dissected by a network of creeks used for irrigation and drainage. Advanced agricultural techniques have been developed and mechanization is extensive. Saga Prefecture is believed to be the point at which the earliest contact between Japan and the continent of Asia was made. In late Edo time (1603–1867), it was influenced by European culture via the city of Nagasaki. The town of Arita (pop. [1960] 15,706) is noted for its china and pottery. Arita ware (Arita-yaki), developed by Ri Sampei, a Korean potter, in the 16th and 17th centuries, is made in approximately 300 small factories, with an annual output valued at about $2,000,000.

Saga, the capital of the prefecture, was the castle town of the lord Nabeshima. Pop. (1960) 129,888. Traces of feudal days still remain in the thatched roofs and the lotus-covered castle moats. Saga is noted for cotton textiles and ceramic wares. (R. B. H.)

SAGA: *see* Icelandic Literature.

SAGAING, a district of the Union of Burma lying to the west of Mandalay on both sides of the Irrawaddy River and in the heart of the Dry Belt. The district has an area of 968 sq.mi. (2,507 sq.km.) and a population (1962 est.) of 379,392. Chief crops are the grain sesamum, millet, rice, peas, wheat, and cotton.

Rainfall ranges from about 25 to 35 in. (635 to 890 mm.). In the hot season the maximum shade temperature rises to a little more than 100° F (38° C). The lowest readings in the cold season average about 56° F (13° C).

Sagaing, the headquarters town, picturesquely situated at the southern end of a north-south ridge conspicuously dotted with white pagodas, is opposite Ava (*q.v.*), 10 mi. SW of Mandalay; pop. (1953) 15,439. It was formerly a capital of Burma (18th century). The Ava Bridge (3,940 ft., completed in 1934 and destroyed during the Japanese invasion but rebuilt later), with its western end at Sagaing, carries the Mandalay-Myitkyina railway and also road traffic. Sagaing is also a river port served by steamers of the Inland Water Transport Board.

Sagaing also gives its name to a division which comprises the districts of Upper and Lower Chindwin, Katha, Shwebo, and Sagaing. (L. D. S.)

SAGAR (SAUGOR), so named after its fine lake (Hindi *sagar*, "lake"), a town and district in the Jabalpur division of Madhya Pradesh, India. The town, headquarters of the district, is picturesquely situated around a lake amidst the spurs of the Vindhya Mountains, 90 mi. (145 km.) NW of Jabalpur. Pop. (1961) 85,491. There is an old Maratha fort now used as a police training college. Saugar University, founded in 1946, has a central campus on one of the spurs (2,000 ft.) overlooking the town. There are some oil and flour mills and a flourishing *bidi* (local cigarette) industry. The town is on the Katni-Bina section of the Central Railway.

SAGAR DISTRICT (area 3,961 sq.mi. [10,295 sq.km.]; pop. [1961] 796,547) is an extensive plain, broken in places by low hills of basalt and sandstone covered with teak forests. The southern and central parts have lava soil, while the northern and eastern have reddish brown soil, formed mostly over granites. The principal crops are wheat, gram, jowar, linseed, and sesamum. The chief landholding classes are Brahmans, Dangis, Lodhis, and Bundela Rajputs. About 42% of the total area is arable and 29% is under forests. Thermal electricity produced at Sagar is transmitted to the adjoining Damoh district also. Sagar district has a number of factories and iron ore and limestone deposits occur in the Shahgarh tract. The Rahatgarh waterfall, the old Rahatgarh fort, and the archaeological site at Eran (to the west) are of tourist interest. The chief towns are Bina-Etawah, Khurai, Bamora, Garhakota, and Deori. (S. M. A.)

SAGE, the common name applied to plants of the genus *Salvia* of the mint family, especially to *S. officinalis,* the leaves of which are used for seasoning. *See* SALVIA.

SAGEBRUSH, the name given to various shrubby species of *Artemisia* native to plains and mountain slopes of western North America. The common sagebrush (*A. tridentata*) is a much-branched shrub, usually 3 ft. to 6 ft., but sometimes 12 ft. high, with silvery gray, bitter-aromatic foliage, the small, wedge-shaped leaves mostly with three teeth at the outer end. This shrub is very abundant on semiarid plains, mainly between 1,500 ft. and 6,000 ft. altitude, where it is often a conspicuous and characteristic feature of the vegetation. It occurs from Montana and western Nebraska to British Columbia and California.

SAGINAW, a city of Michigan, U.S., and seat of Saginaw county, is located 10 mi. S. of Bay City and 92 mi. N.W. of Detroit, on both banks of the Saginaw river 15 mi. from its entrance into Saginaw bay (Lake Huron). It is a centre of farming and manufacturing and a port of entry. Nearby communities include Chesaning, Carrollton and Frankenmuth.

Saginaw means "land of the Sauks" in the language of the Chippewa Indians who once dominated the valley after driving out the Sauks in the 16th century. A post was established in 1816 by the American Fur company and Fort Saginaw was constructed on the west bank of the river in 1822. Although the fort was abandoned the following year, a settlement known as Saginaw City grew up around the fur-trading post and received its charter in 1870. East Saginaw, established in 1849 and chartered 1859, joined with Saginaw City in 1889 to form Saginaw. In 1936 the city adopted a council-manager form of government.

Saginaw was a major lumbering centre from 1834 when a steam sawmill began operations until about 1890, by which time the pine forests were depleted. Salt deposits, coal and oil are productive mineral resources of the area and their development helped to offset the decline in lumber trade. Served by major railroads, highways and an airport, Saginaw became a wholesale and trading centre for northeastern Michigan. It manufactures automotive parts, particularly steering gears, malleable and gray iron, graphite, baking machinery, mobile homes, truck trailers and paper products. The county contains approximately 4,500 farms averaging 45 ac. in size and producing sugar beets, beans and wheat. One of the world's largest bean elevators is in Saginaw. Parks include the Ezra Rust and Hoyt parks and Ojibway Island. The Schuch hotel contains a museum of Indian artifacts.

Population of the city in 1960 was 98,265 and the Saginaw standard metropolitan statistical area comprising Saginaw county had a population of 190,752. For comparative population figures *see* table in MICHIGAN: *Population.* (MA. R.)

SAGITTARIUS (the "Archer"), in astronomy, a constellation and sign of the zodiac. In mythology, Sagittarius was pictured as a centaur preparing to shoot an arrow. The southernmost zodiacal constellation, it appears rather low in the south in the early evenings of the late summer for observers in middle northern latitudes. Six of its stars outline the inverted Milk Dipper, which has its handle thrust into the Milky Way. Near the western border of Sagittarius is the winter solstice, the southernmost point of the sun's apparent annual course around the heavens. Also in this region is the direction of the centre of our spiral galaxy, some 30,000 light-years distant from Earth. This area is accordingly one of exceptional complexity and interest as viewed with the naked eye and with the optical and radio telescope. The great star cloud in the central region of Sagittarius is one of the brightest features of the Milky Way. *See* CONSTELLATION. (R. H. BR.)

SAGO, a food starch prepared from a deposit in the trunk of several palms, the principal source being the sago palms (*Metroxylon rumphii* and *M. sagu*), native to the Indonesian archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thickset trunk. They attain maturity and produce an inflorescence (flower spike) at the age of 15 years, when the enormous pith of the stem is gorged with starch. If the fruit is allowed to form and ripen, the whole of this starchy core material passes into the developing fruits, leaving the stem a mere hollow shell; and the tree after ripening its fruit dies. Accordingly the palms are cut down as soon as the inflorescence appears, the stems are divided into sections and split up and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, whence it is known according to size as pearl sago, bullet sago, etc.

A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting. Sago is also obtained from various other Indonesian palms such as the Gomuti palm (*Arenga pinnata*), the Kittul palm (*Caryota urens*), the cabbage palm (*Corypha umbraculifera*), besides *Corypha utan, Raphia flabelliformis* and *Phoenix pusilla,* also from *Mauritia flexuosa* and *Guilielma gasipaes,* two South American species. It is also obtained from the pith of species of *Cycas.*

SAGUARO (*Cereus giganteus* or *Carnegiea gigantea*), a remarkable tree cactus, rising to 50 ft. in height, called also giant cactus and monument cactus, native to arid districts in southern Arizona, southeastern California and Sonora, Mex. It has a stout, woody, vertically ribbed stem, one to two feet in diameter, sometimes rising unbranched, like a green, fluted column, whence the name monument cactus; more frequently it bears a few large, stout, widely diverging candelabralike branches, but occasionally it bears numerous branches which rise vertically

from near the base like a group of organ pipes. Close to the top of the stem or branches it bears white flowers which are followed by crimson edible fruits. In Arizona, of which it is the floral emblem or state flower, a desert tract containing numerous fine living specimens of the tree was set apart and is now known as Saguaro National monument. *See* also CACTUS FAMILY.

RUTHERFORD PLATT

SAGUARO (CEREUS GIGANTEUS)

SAGUENAY, a river of Quebec, Can., which drains the waters of Lake St. John into the St. Lawrence River about 120 mi. northeast of Quebec City. Flowing ESE, the Saguenay, in the first third of its 105-mi. length (475 mi. long from the head of the Peribonca River), descends about 300 ft. in a turbulent stream. Thereafter, the valley is virtually a fjord through which the river, without shoals (average depth, about 800 ft.) or obstructions, continues between precipitous cliffs which culminate in the majestic capes Trinity and Eternity, more than 1,600 ft. high. The upper river is an important source of hydroelectric power, used primarily for aluminum production at Arvida. The river is navigable from its mouth at Tadoussac, the oldest European trading post in Canada, to Chicoutimi, above which the rapids begin. Ha Ha Bay, about 20 mi. downstream from Chicoutimi is a fjordlike arm of the Saguenay into which the Ha Ha River and the Rivière Mars empty near Port Alfred at the head of the bay. (J. D. I.)

SAGUIA EL HAMRA: *see* SPANISH SAHARA.

SAGUNTO (formerly MURVIEDRO), a town of eastern Spain about 15½ mi. (25 km.) NNE of Valencia on the Valencia–Barcelona coast railway, and a junction for the railway to Aragon. Pop. (1960) 40,293 (mun.). The town has light industries, and its port (2½ mi.) exports minerals and fruit. Sagunto is the ancient Saguntum, a town thought to have been founded by colonists from Zacynthus (Zanti; whence its name). About 225 B.C. the Romans, disquieted by the growth of Carthaginian power in Spain, concluded an alliance with Hasdrubal which guaranteed the independence of Saguntum and required the Carthaginians not to cross the Ebro. In 219, however, Hannibal attacked Saguntum. The town resisted for eight months, at the end of which it was taken by storm. Rome complained to Carthage, requiring the surrender of Hannibal; the council refused, and the Second Punic War began. Afterward the Romans restored the ancient importance of Saguntum, whose inhabitants received Roman citizenship, and enriched the town with the monuments of which the remains may be seen today. The Roman theatre built under Septimius Severus and Caracalla is the most notable building. There are also remains of different periods: the acropolis, the temple of Diana, the temple of Venus, and the aqueduct (constructed from rough Iberian stones through the Roman period to the Moorish). (R. A. DE.)

SAHA, MEGHNAD N. (1893–1956), Indian physicist noted for his development of the thermal ionization equation (which, in the perfected form due to E. A. Milne, has remained fundamental in all work on stellar atmospheres) and for his application of it to the interpretation of stellar spectra. Born on Oct. 6, 1893, in Bengal, Saha received his first training in Calcutta, and carried out postgraduate work at Imperial college, London. After returning to India, he became professor of physics at Allahabad (1923–38) and at Calcutta (1938–55). He was elected a fellow of the Royal society in 1927 and was president of the United Provinces Academy of Sciences and of other Indian scientific bodies. He was mainly instrumental in the foundation of the Calcutta Institute of Nuclear Physics, of which he became honorary director.

In his later years, while not neglecting research, Saha increasingly turned his attention to the social relations of science; he founded the outspoken journal *Science and Culture* in 1935. In 1951 he was elected to the Indian parliament as an independent. He continued publishing papers on nuclear physics and astrophysics until his death in New Delhi on Feb. 16, 1956.

Among his works are: *A Treatise on Heat,* with B. N. Srivastava, 3rd ed. (1950), and *A Treatise on Modern Physics,* vol. i, with N. K. Saha (1934). An important paper is "Ionization in the Solar Chromosphere," *Phil. Mag.,* vol. 40, p. 472 (1920).

See S. N. Sen (ed.), *Professor Meghnad Saha: His Life, Work and Philosophy* (1954). (B. E. J. P.)

SAHAPTIN, a large American Indian linguistic stock, spoken in what is now southeastern Washington, west-central Idaho, part of eastern Oregon, and north-central California. The four major divisions, all mutually unintelligible, were: northern Sahaptin, spoken by the Yakima, Klikitat, Palus, Wanapam, Tenino, Umatilla, and Wallawalla tribes; Nez Percé; Cayuse-Molala; and Klamath-Modoc. Cayuse-Molala was formerly called Waiilatpuan and considered a separate stock. Similarly, Klamath-Modoc was separated under the name Lutuamian. Further studies have shown these to be divergent branches of Sahaptin.

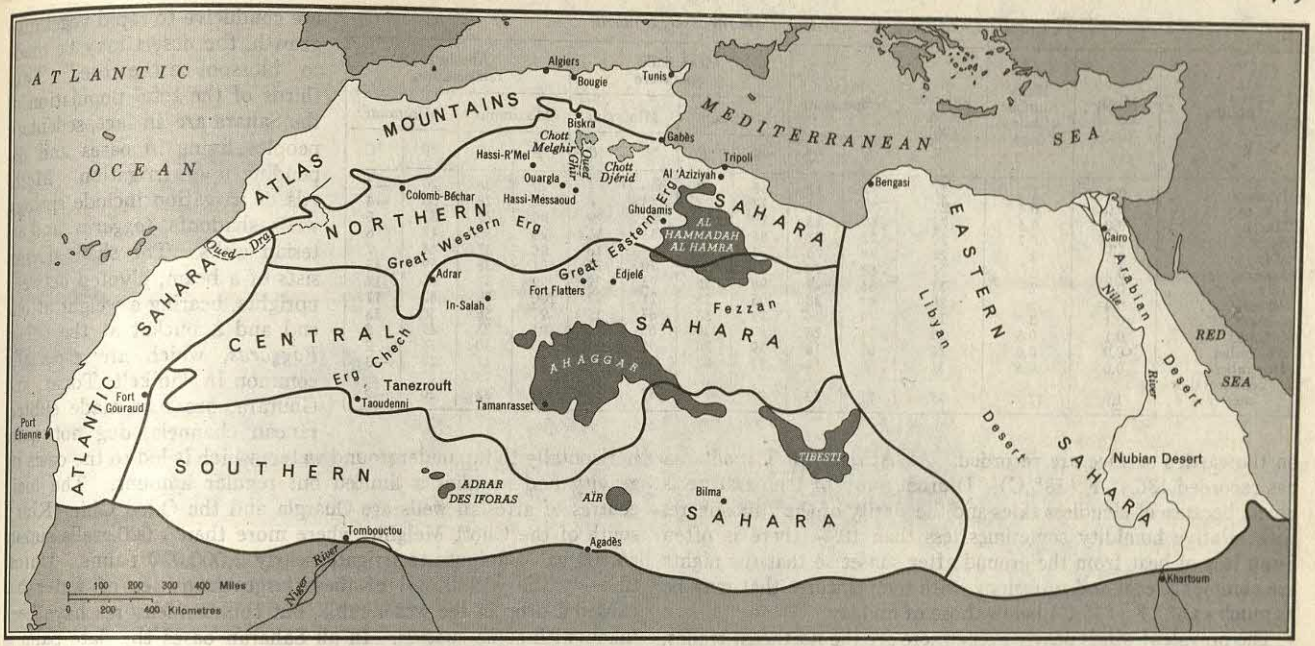
Earlier the spelling Shahaptian was sometimes used; also, the name occasionally was employed as a designation for the Nez Percé tribe (*see* INDIAN, NORTH AMERICAN; PENUTIAN).

See M. Jacobs, *Northwest Sahaptin Texts* (1929), *A Sketch of Northern Sahaptin Grammar* (1931); T. Stern, "Klamath Myth Abstracts," *Journal of American Folklore,* vol. 76 (Jan. 1963).

SAHARA, from the Arabic word *sahrá* ("wilderness"), is the great desert of North Africa, the largest desert in the world. It stretches across Africa from the Atlantic coast through Egypt to the Red Sea, beyond which desert conditions continue into Arabia and Iran. Around its edges are transitional areas where rainfall is greater and true desert conditions gradually disappear, so that nowhere has it precise boundaries. Its greatest west-east extension exceeds 3,000 mi., and it is seldom less than 1,000 mi. wide. Its total area, perhaps 3,500,000 sq.mi. (9,100,000 sq.km.), occupies between one-quarter and one-third of the African continent. Despite the physical unity of the whole area, it includes many political divisions. Much of the Sahara consists of a plateau of an average elevation of 1,000 ft., but it is far from uniform in character. There are, for example, considerable areas that are 600 ft. or less above sea level (the chotts or salt lakes near Biskra being actually below sea level), while some of the highest points in the Ahaggar Massif reach nearly 10,000 ft., and parts of Tibesti exceed 11,000 ft.

Geology, Structure, and Physiographical Evolution.—The main features of geology and structure are now reasonably well understood, although much detailed work remains to be done. The area as a whole is quite distinct from the Atlas Mountains, which belong, tectonically, to Europe. The oldest rocks, of Archean and Precambrian Age, were folded and denuded to form the Saharan platform, upon which later deposits have been laid. There have been numerous dislocations, the more marked of which have been accompanied by volcanic activity; several of the highest peaks in the central Sahara, such as Mt. Tousside (10,712 ft. [3,265 m.]) in Tibesti, are the remains of extinct volcanoes of Tertiary and Quaternary Age. Elsewhere, uplift has caused the renewal of erosion leading to the cutting of deep valleys and gorges, such as those of the Tasili N'Ajjer. During Cretaceous and later times much of the Sahara was submerged; in consequence extensive areas are covered by sandstones, such as the Nubian sandstone, of Cretaceous Age, and limestones, which were laid down on the floor of the sea. There are also large basins occupied by sediments of continental origin deposited by wind or in shallow fresh or saline waters. The horizontally bedded Cretaceous and other rocks form plains, plateaus, and escarpments that are dissected by former river valleys (wadis) and are in striking contrast to the volcanic topography of other areas.

At one time the vast quantities of sand in the Sahara were believed to have a marine origin, but the sand is now known to be of Quaternary (probably Pleistocene) Age, and there is no evidence of any marine transgression since pre-Tertiary times. During the Quaternary Ice Age in Europe, the Sahara's climate was much



THE EXTENT OF THE SAHARA DESERT, AFRICA

wetter; erosion occurred as it does in moist temperate or subtropical regions today, and there was an extensive system of rivers. Much of the Sahara was probably covered by grass with some trees. With the retreat of the ice sheets from Europe, this vegetation disappeared and arid conditions were established; the soil dried out and became liable to large-scale wind erosion. Some authorities claim that there is considerable evidence to suggest that desert conditions are extending, at the present time, into many of the semidesert and savanna regions surrounding the Sahara. The alarmist reports of certain writers about the advance of the desert have been fairly conclusively proved to be exaggerated; moreover the explanation of any extension of desertlike conditions may be unrelated to climatic conditions. The whole question of climatic change in historic times, in the Sahara and elsewhere in the world, is highly controversial and is under constant review by experts in many fields, notably those associated with the work of UNESCO's Arid Zone Research Group. (See *Bibliography.*)

Physical Characteristics.—Three main types of surface and scenery are commonly recognized in the Sahara today: the erg, the reg (or areg), and the hammada. The erg is the desert of shifting sand dunes, which lie in the bottoms of the great basins where former rivers piled up most alluvium. In some areas there is still movement among the dunes; elsewhere movement has ceased and the sand dunes appear "fossilized." The Great Western and Eastern Ergs, between Beni Abbès and Ghudamis (Ghadames), are the most difficult of all Saharan areas and are avoided, as far as possible, by modern trans-Saharan routes. The Libyan Desert is another extensive area of unmitigated sandy waste. The reg desert consists of wind-scoured plains strewn with pebbles, boulders, and gravels. The hammada are rocky plateaus with bare rock outcrops, often much dissected by deeply eroded valleys and gorges; they are common around the Ahaggar and Tibesti and, at lower altitudes, in the Western Sahara.

The high central ridge crossing the Sahara from west to east is dominated by the Ahaggar Massif of Archean and Paleozoic rocks. Its highest peak, Tahat (9,842 ft. [3,000 m.]), is sometimes snowcapped. Associated with the massif are the plateaus of Ahenet, Mouydir, and Tasili N'Ajjer. Westward is the harsh and sterile Tanezrouft and the Erg Chech, eastward the Fezzan.

Around the central ridge the Sahara extends in all directions. The Western, or Atlantic, Sahara in Spanish Sahara (Río de Oro) and Mauritania is relatively low-lying (1,500 ft. at most and often below 600 ft.) and of monotonous relief. The Southern Sahara, reaching almost to the Niger Valley, includes the high massifs of the Adrar des Iforas, Aïr (Azbine), Tibesti (Emi Koussi, 11,204 ft. above sea level), and Ennedi. The Eastern Sahara extends eastward to the Red Sea between the latitudes of Khartoum and the Mediterranean Sea. The Libyan Desert (and its continuation in Egypt known as the Western Desert) consists of uniform low relief with almost level dunes and sandy wastes crossed by very few routes. Beyond the Nile is the Arabian (or Eastern) Desert in Egypt and the Nubian Desert in northeastern Sudan, where Jebel Oda reaches 7,412 ft. near the Red Sea. The Northern Sahara consists of the Great Western (Saoura) Erg, the Great Eastern (Igharghar) Erg, and the Hammada el Homra (Al Hammadah al Hamra), with the relatively small oasis areas of Gourara, Touat, and Tidikelt. A depression along the southern side of the Saharan Atlas is marked in the west by the Oued Dra, draining to the Atlantic, and in the east by a line of chotts, of which the Chott Melghir (Melrhir) south of Biskra is below sea level and the Chott Djérid in southern Tunisia is the largest. The Gulf of Gabès (Qābis) was part of this same depression but is now submerged and forms an arm of the Mediterranean Sea.

Climate.—*Rainfall.*—Lack of rainfall is the distinguishing feature of the Sahara as of all the world's great deserts. Rainfall averages less than 10 in. (254 mm.) a year in the north (south of the Atlas Mountains) and 15 in. (380 mm.) in the south, where evaporation is greater, in the latitude of Tombouctou (Timbuktu) and Agadès. The true desert, with 5 in. or less in a year, occupies a more restricted area, and absolute desert is most common in the extensive flat areas of the Tanezrouft, or "land of thirst," to the west of the Ahaggar. Everywhere the general lack of rainfall is marked by great variations from year to year and by the liability for such rain as falls to occur in sudden and violent storms at very irregular intervals. At Adrar 3.7 in. have been recorded in a few hours, but at In-Salah only 0.4 in. was recorded in four years. El Goléa experienced only one fall of rain in seven years, and Tidikelt only one in ten years.

Systematic meteorological observations have been made at an increasing number of stations on the edge of the desert. The table illustrates rainfall and other climatic conditions at the Jules Carde Observatory at Tamanrasset (Fort Laperrine) in the Ahaggar Mountains at 4,429 ft. above sea level, where regular records are available from 1932.

Temperature.—The Sahara is one of the hottest regions of the world. Tamanrasset (*see* table) shows some of the special aspects of the temperature conditions of Saharan stations. Mean annual temperatures of more than 80° F (27° C) and even 85° (29°) are widely recorded, with particularly high monthly figures for June, July, and August when the highest-known shade temperatures

Climatic Conditions Recorded at Tamanrasset, Sahara

on the earth's surface are recorded. Al 'Aziziyah in Tripolitania has recorded 136.4° F (58° C). Diurnal range of temperature is great; because of cloudless skies and the clarity of the atmosphere, with relative humidity sometimes less than 10%, there is often rapid loss of heat from the ground after sunset so that the nights are commonly cool and refreshing, with temperatures that may be as much as 60° F (33° C) below those of midday.

The prevalent winds nearly everywhere are the northeast trades, though in the Western Sahara westerly winds are also common. Along the southern edge of the desert, especially in West Africa, southwesterly winds are drawn in from the Guinea coast toward the central Sahara, particularly in July, and bring limited amounts of rainfall. Their degree of penetration, and the quantity of rainfall, vary from year to year: they reach the Adrar des Iforas regularly and sometimes affect the Ahaggar Massif. In the northern Sahara frontal activity from the Mediterranean occasionally brings north and northwest winds, with moist air and storms, during the winter months. Hot, dry, desiccating winds originating in the central Sahara also blow outward to affect areas adjacent to, and beyond, the desert; these include the northeasterly harmattan, which regularly affects many parts of western Africa from November to March and occasionally reaches right to the Guinea coast, and the northerly blowing winds that bring very dry conditions to parts of the Mediterranean seaboard and are variously known as sirocco, khamsin, *guebli, chehili,* and simoom.

Vegetation and Animal Life.—Areas from which all plant life is absent, such as the Tanezrouft and the Hammadat Tinghert (Hammada of Tinrhert) south of Ghudamis, form a relatively small part of the Sahara. Mobile sand dunes are generally devoid of plants, but the sandy parts of the basins of the great rivers of Quaternary times often have a moderate vegetation cover which draws on the water reserves available underground. Nevertheless plant life is usually poorly developed. It consists of two very distinct types: the permanent, such as betoum (Atlantic turpentine tree) and acacia trees and thorny shrubs such as tamarisk and jujube; and the ephemeral, widely known by the desert peoples as *acheb* (*ashab*)—delicate herbs whose seeds germinate immediately after rain, grow rapidly, flower for a brief period, set fruits and seeds, and then die. The natural vegetation of the oases was probably the oleander with tamarisk. Of the introduced plants, the date palm is of outstanding importance. Its fruits provide food for local consumption as well as for trade, and the crushed seeds are fed to camels.

As with the vegetation, the Sahara has a highly specialized wild fauna. Gazelles, desert antelopes, and wild goats are common on the northern and southern edges of the desert; jackal, fox, and badger also occur. Bustards are found on the south side of the Saharan Atlas; ostriches are now scarce. Horned vipers, scorpions, lizards, locusts, flies, and ticks are common. The Egyptian monitor, which looks like a small crocodile, survives in certain areas such as the tributaries of the Igharghar (Irharhar). Domesticated animals, especially camels, sheep, and goats, have been introduced to all the oases.

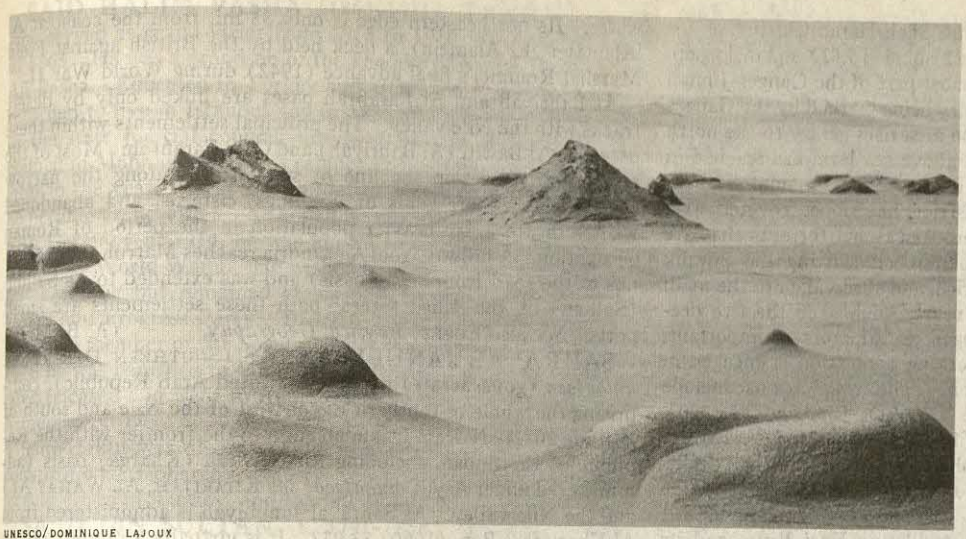
Economic Development.—When water can be made available to soils that are often fertile, in a region with temperatures that are conducive to rapid vegetative growth, the desert may be made to "blossom as the rose." Two-thirds of the total population of the Sahara are, in fact, sedentary peoples living in oases and depending upon irrigation. Methods of irrigation include springs, wells, shadoofs, *foggaras,* and artesian wells. The shadoof consists of a beam, pivoted between uprights, bearing a weight at one end and a bucket at the other. *Foggaras,* which are especially common in Tidikelt, Touat, and Gourara, are man-made subterranean channels, dug not quite horizontally to tap underground water, which is led to the oasis by gravity and supplies a limited but regular amount. The main centres of artesian wells are Ouargla and the Oued Ghir (Rhir), south of the Chott Melghir, where more than 1,000 wells supply 69,000 gal. a minute to irrigate nearly 2,000,000 palms. Unfortunately the withdrawal of these large quantities of water has caused a drop in the water table, but countermeasures have been taken with some success. In all Saharan oases the date palm is the chief tree and the main source of food, while in its shade are grown citrus fruits, figs, peaches, apricots, vegetables, and cereals such as wheat, barley, and millets.

In marked contrast to the agriculturalists are the nomadic pastoralists of the desert border and of the fringes of the central mountain areas; the difference in the way of life is indeed far more significant than racial or linguistic differences. In general the poorer or drier the desert, the more scattered the population. Camels play an important part in the lives of the nomads, though numerically sheep and goats dominate. The availability of fodder and drinking water determines the extent of the grazing of livestock and the migrations of their owners. The Regibat of Spanish Sahara sometimes travel 400 mi. eastward to the Erg Chech to find water for their camels. The razzias or raids by nomads upon oasis cultivators are much less common than they were, the result of the pacification of all but the most remote areas.

Apart from some modern developments connected with mineral exploitation (*see* below), Saharan commerce still largely follows the traditional pattern: the supplying of the desert peoples with cereals, wool, and manufactured goods in exchange for dates, and the maintenance of the trans-Saharan trade, always the monopoly of the nomads. Salt and ivory in particular have been carried across the desert for centuries. Even today salt remains an important product, especially at Taoudénni and Bilma, and thousands of tons of salt are transported on camels in huge caravans (*azalais*), especially on the great salt route from Taoudénni to Tombouctou (Timbuktu).

Important deposits of iron ore occur at Fort Gouraud in Mauritania, from which a 400-mi.-long railway has been built to the coast near Port Étienne. Intensive prospecting for oil in many parts of the Sahara since 1952 has proved the existence of a North African oil province. In Algeria there are large resources at Hassi-Messaoud (60 mi. ESE of Ouargla), and 300 mi. farther southeastward at Edjelé (Edjeleh) and Zarzaitine on the Libyan boundary. Pipelines have been built from Hassi-Messaoud to the port of Bougie and from Edjelé to the Tunisian oil port of La Skhirra (Cekhira) north of Gabès. Additional pipelines were under construction in the 1960s to other ports on the Mediterranean coast. In Libya the principal resources so far discovered are at Zelten (Zaltan) and Dahra, both south of the Gulf of Sidra, to which pipelines have been built to new port terminals at Marsa el Brega (Marsa al Burayqah) and Sidra (Surt). Exports started in 1961.

Considerable supplies of natural gas are available at Hassi-R'Mel (40 mi. NW of Ghardaia), at Hassi-Messaoud, and at In-Salah (600 mi. S of Algiers). From Hassi-R'Mel a pipeline takes gas to Algiers, Arzew, and Oran, whence it is taken to Europe by methane tankers.



UNESCO/DOMINIQUE LAJOUX

NEBKAS IN THE DESERT. THESE ARE PETRIFIED FORMATIONS OF VEGETAL ORIGIN WHICH FORMERLY CLUNG TO THE ROOTS OF TREES, NOW DEAD. TIME AND WEATHER HAVE MOULDED THEM INTO THE STRANGE SHAPES SHOWN IN THE PICTURE

Improved communications have made possible such economic developments, but despite the introduction of new methods of transport, some caravan routes remain important and Biskra, Ghardaia, and Agadès are still large caravan centres. Roads are replacing tracks on the Colomb-Béchar–Reggane, the Laghouat–El Goléa–In-Salah, and the Biskra–Touggourt–Fort Flatters routes. Railways, despite many proposals for trans-Saharan routes, do not penetrate farther into the desert than the line that stops 60 mi. south of Colomb-Béchar on its intended route across the Tanezrouft to Gao in Mali. Numerous air routes linking Europe with tropical and southern Africa cross the desert using airports on the fringes such as Kano and Tripoli.

Peoples.—In prehistoric times the Sahara was undoubtedly wetter and had a better vegetation cover than it does today, and there is evidence of Neolithic and Paleolithic culture, including rock drawings of animals no longer found in the desert. Archaeological studies of flora and fauna, as well as of cave paintings, have indeed revealed flourishing prehistoric periods that preceded the desiccation of historic times. This desiccation is suggested by the abandonment of Roman military establishments in North Africa, although contributory and even decisive reasons may have been the neglect of the water supply and of irrigation works.

The earliest inhabitants, probably Negroes, retreated before the Berbers who came with their swift-moving camels (*see* BERBER). They in turn were pushed back, especially into the uplands of the central Sahara, by the Arabs who also used camels and were spurred on by their zeal for Islam. The Arabs also introduced the Arabic language and instituted slavery which remained a lucrative trade until well into the 20th century.

From the mixture of Berber and Arab there emerged the three great ethnic groups of today: in the central Sahara the Tuareg (*q.v.*), the "people of the veil," who are camel nomads; in the east the Tebu (*q.v.*), who closely resemble the Tuareg though there has been considerable admixture with negroid peoples; and in the Western Sahara the Moors (*q.v.*) or *beidan* ("whites") as they are often called to distinguish them from the black peoples of the Sudan, a cultured group who, unlike the Tuareg, have been completely islamized. Of the smaller communities, the Mozabites of the Mzab are of special interest since their commercial wisdom has given them an importance out of all proportion to their numbers. In the oases the Negroes are still numerically dominant and are divided into three distinct classes: the free men, who are the proprietors; the Haratin, the tradesmen; and the slaves.

History and Exploration.—Despite some Egyptian, Carthaginian, and Roman penetration, European contacts with the Sahara proper were never well developed, and European influence was wholly eliminated after the Muslim conquest of North Africa. During medieval times Jewish and Genoese merchants acquired considerable knowledge of the desert, but the real opening up of the Sahara came with the 19th century through the observations of travelers like Dixon Denham (*q.v.*), Hugh Clapperton (*q.v.*), Walter Oudney, and R. A. Caillié (*q.v.*), and the scientific observations of expeditions such as those of Heinrich Barth (*q.v.*).

The French have played a leading part in the exploration and pacification of the desert. Following their occupation of Algiers in 1830, they advanced slowly southward, occupying the northern oases of Laghouat and Ghardaia in 1852 and Touggourt and Ouargla in 1854. Plans for a vast French African empire were formulated; surveys for trans-Saharan railways were made; and official missions such as that of F. Foureau and F. J. A. Lamy (1898–1900) were undertaken to establish French claims in the Sahara. During the period 1890–1910 three Anglo-French agreements fixed various boundaries and much of the desert was conquered by the French in a series of campaigns under the command of Gen. M. J. F. H. Laperrine, Capt. Charlet, Col. J. Tilho, and others. French and other travelers and scientists added greatly to the modern knowledge of the Sahara, though extensive areas remained to be surveyed and scientifically investigated.

By 1964 the only part of the Sahara remaining directly under European control was Spanish Sahara (Río de Oro). Of former French areas with important Saharan interests, Morocco and Tunisia gained independence in 1956, Mauritania, Mali, Niger, and Chad in 1960, and Algeria in 1962. Libya, originally an Italian colony and then a trust territory of the United Nations, was recognized as independent in 1951. The Republic of the Sudan replaced the Anglo-Egyptian condominium in 1956.

(R. W. SL.)

SAHARANPUR, a town and district in the Meerut division of Uttar Pradesh, India. The town lies on the Damaula Nadi (stream) about 95 mi. (155 km.) NNE of Delhi and is an important railway junction. Pop. (1961) 185,213. It has a sugar and a paper mill, a wood-carving industry, railway workshops, and is the site of the Government Botanical Gardens. Two colleges are affiliated to Agra University. Saharanpur was founded about 1340 and

derives its name from a Muslim saint, Shah Haran Chisti.

SAHARANPUR DISTRICT (area 2,132 sq.mi. [5,522 sq.km.]; pop. [1961] 1,615,478) forms the uppermost part of the Ganges-Jumna doab (interfluve), its eastern boundary being marked by the Ganges and the western by the Jumna. The area rises gently to the north where elevations of about 3,000 ft. above sea level are reached in the foothills of the outer Siwalik Range. The submontane belt, extending over one-sixth of the district, has slopes covered with forests and is intersected by numerous seasonal torrents that are lost in the *bhabar* (detrital piedmont) belt skirting the Siwalik Hills on the south. Wheat, gram, rice, and sugarcane are the main crops. The area under sugarcane nearly doubled in the two decades after World War II, and sugar manufacture is important. More than half of the district's working population is engaged in occupations other than cultivation. The chief towns include Hardwar (pop., 58,513), Roorkee (33,651), Deoband (29,980), Gangoh (18,886), and Manglaur (15,206). (S. S. BH.)

SAHARSA, a district in the Bhagalpur division, Bihar, India, stretches southward from Nepal to a line about 10 mi. N of the Ganges River. Area 2,093 sq.mi. (5,421 sq.km.). Pop. (1961) 1,723,566. It is traversed by the oscillating Kosi River and its distributaries which have ravaged the district. Large areas of fertile paddy lands have become sandy areas or grass-covered marshes and wastes. Rice, maize (corn), oilseeds, and jute are the principal crops. The flood embankment and irrigation canals of the Kosi project were constructed to protect and enrich the district. The district headquarters are at Saharsa on the Mansi-Supaul branch of the North Eastern Railway. (E. AH.)

SAHO-AFAR, two closely related Cushitic peoples (*q.v.*) inhabiting the arid coastal regions of French Somaliland and Ethiopia. The Afar, who are known to the Arabs as Danakil, in the 1960s numbered about 100,000, and the Saho about 50,000. They are chiefly pastoral nomads with considerable numbers of camels, sheep, goats, and cattle, but the Saho also cultivate. Both are Sunni Muslims (*see* ISLAM) although Christianity has found some adherents among the Saho. They are warlike, especially the Afar, and each community is divided into a large number of patrilineal segments ruled by chiefs and lineage assemblies, there being several Muslim sultanates of considerable antiquity among the Afar. The Afar have a pervasive class division between the Asaimara ("Red") nobles and the Adoimara ("White") tributary commoners; the former are thought to descend from immigrant peoples from the Ethiopian highlands. The Afar also have an age-set (*q.v.*) system. *See* also ETHIOPIA: *The People;* SOMALILAND, FRENCH.

See I. M. Lewis, *Peoples of the Horn of Africa: Somali, Afar and Saho* (1955); G. A. Lipsky *et al., Ethiopia* (1962). (I. M. L.)

SAHRA' AL GHARBIYAH, AS (WESTERN DESERT), a *muhafaza* (governorate) of Egypt (United Arab Republic), comprising the whole of Egypt west of the Nile valley and delta and north of latitude 26°20′ N. It is administered from Matruh on the Mediterranean coast. Pop. (1960) 103,453. The greater part is a massive plateau averaging 700–800 ft. (215–245 m.) above sea level and nowhere surpassing 1,500 ft. It comprises great thicknesses of sedimentary rocks little disturbed but dipping gently to the north. Successively younger rocks outcrop from south to north with Cretaceous and Eocene limestones in the southern and central parts and marly limestone and calcareous sandstones of Miocene Age in the north. The surface is little dissected; its nature results more from wind than water action and it thus offers direct contrast with the heavily dissected Arabian (Eastern) Desert. Stone covered wastes and in places sandy plains prevail. Longitudinal belts of parallel sand dunes occur in the centre and west, some up to 200 ft. high in the Great Sand Sea which extends south from Siwah oasis. The greater part of the desert is extremely arid; only along the coast is there a light rainfall, of 4–6 in. (100–150 mm.) in winter. Notable, however, are the depressions in the plateau surface that permit shallow wells to reach underground water and thus to support life and create oases (Al Bahriyah, Al Farafirah, and Siwah). At both Qattarah and Siwah (*q.v.*) the depressions are below sea level. The Qattarah depression reaches 435 ft. below sea level and occupies nearly 7,000 sq.mi. (18,100 sq.km.). Its floor is largely covered with salt marsh and lagoons of brackish water. Its northeastern edge is only 35 mi. from the coast at Al 'Alamayn (El Alamein), a neck held by the British against Field Marshal Rommel's final advance (1942) during World War II.

Al Bahriyah and Al Farafirah oases are linked only by desert tracks with the Nile valley. The principal settlements within these oases are Al Bawiti (Al Bahriyah) and Qasr Farafirah. Most of the population resides in the line of small towns along the narrow coastal plain where ruins of dwellings, cisterns, and abandoned wells indicate a far heavier population in the period of Roman occupation. A railway from Alexandria reaches Matruh (the terminus of the road from Siwah oasis) and was extended to As Sallum (Sollum) by the Allied forces; both these settlements are small ports. *See* also EGYPT: *Physical Geography.* (A. B. M.)

SAHRA' AL JANUBIYAH, AS (SOUTHERN DESERT), a *muhafaza* (governorate) of Egypt (United Arab Republic), comprising the whole of southern Egypt west of the Nile and south of latitude 26°20′ N from Dakhilah oasis to the frontier with the Republic of the Sudan, excluding Al Kharijah (Kharga) oasis (administered under Asyut *muhafaza; see* KHARIJAH, AL WAHAT AL) and the Nile valley. As Sahra' al Janubiyah is administered from Al Kharijah. Pop. (1960) 33,932. It is virtually a rainless region of the eastern Sahara, and forms the east-central sector of the Libyan Desert. It is mainly composed of Nubian sandstone, which has weathered to undulating plains, in places extensively covered with sand desert. In the extreme north and east, limestone escarpments diversify the landscape. In the west, the rocky Hadabat al Jilf al Kabir (plateau), rising on the north side from sand desert, attains 3,116 ft. (950 m.). A series of depressions, superficially resembling one continuous depression, begins near the Sudan frontier and continues north into the Western Desert (As Sahra' al Gharbiyah). These depressions permit shallow wells to reach underground water in aquifers in the Nubian sandstone, and a number of oases (including Al Kharijah and Dakhilah) occur within As Sahra' al Janubiyah. Projects to expand irrigation and settlement in this area, now termed the New Valley, are in progress. There is evidence of large pastoral populations in this area in ancient times when aquifers may have outcropped and discharged at the surface because of heavy erosion and a higher water table than now exists.

Dakhilah oasis lies about 80 mi. W of Al Kharijah and contains two principal settlements, Balat and Mut. It lies in the depression at only 118 ft. above sea level. The people are a mixture of Berber and Bedouin stock, relying for subsistence mainly upon their gardens and date palms. Wheat, and bersim for fodder, are the principal crops. Dakhilah is practically isolated except for a motorable desert track extending from Al Kharijah through Balat to Mut. *See* also EGYPT: *Physical Geography.* (A. B. M.)

SAICHŌ (767–822), eminent Japanese Buddhist monk who established the Tendai sect in Japan. He is also known as Dengyō Daishi, his posthumous name and title. His zeal for reform and the location of his monastery on Mt. Hiei (788), northeast of the new imperial capital Heian-kyō (Kyōto), established in 794, strengthened his affiliation with the court. Sent to China in 804, he returned the next year and introduced the highly eclectic Tendai (Chinese *T'ien-t'ai*) teachings. His cooperation with the court brought generous patronage and his monastery soon became the most powerful, a centre of Buddhist learning and discipline from which emerged most of the new sects during the next five centuries. He foreshadowed later Japanese Buddhist trends by his reverence for the native Shintō deities and emphasis on the patriotic mission of Buddhism to serve and protect the state. Although frequently engaged in polemics, his contribution was more significant as an effective leader and organizer than as a religious thinker. (D. H. SH.)

SAIDA (as ancient SIDON one of the two principal cities of Phoenicia), the administrative centre of the *muhafaza* (province) of Southern Lebanon, Lebanon, lies on the Mediterranean, 25 mi. (40 km.) SSW of Beirut. Pop. (1961 est.) 32,200. The town is the terminal of the Trans-Arabian Pipe Line (Tapline) from the oil centre of Abqaiq in the Hasa (*q.v.*) province of Saudi Arabia, and has huge storage tanks. It is also a trade and market centre for the agricultural products of the surrounding area. *See* SIDON.

SAID HALIM PASHA (1863–1921), Turkish statesman who served as grand vizier from 1913 to 1916, was born in Cairo in 1863. He was a grandson of the khedive of Egypt, Mohammed Ali Pasha. Educated in Turkey and afterward in Switzerland, he returned to live in Istanbul and in 1888 was appointed a member of the state judicial council. In 1911 he was president of that council in Mahmud Shevket's cabinet and became foreign minister later in the year. After the murder of Mahmud Shevket in 1913 he became grand vizier. Although he signed the treaty of alliance with Germany in 1914, he was known to be opposed to Turkey's entry into World War I. He wished to resign when war became a *fait accompli* but remained at his post on the insistence of the Union and Progress Party. In 1916, however, he did resign and became a member of the Senate. After the armistice of Mudros in 1918 he was banished to Malta by the British authorities. He was later released and went to Rome where he was assassinated by an Armenian on Dec. 6, 1921.

Said Halim was also a prolific essayist: his subjects included constitutional monarchy, bigotry, the social, political and intellectual crises of Turkey, and the fall of Islam. (M. P. P.)

SA'ID IBN SULTAN (*c.* 1791–1856), the Saiyid (ruler) and sultan of Muscat and Oman and Zanzibar from 1806 or 1807 to 1856, the most powerful and enlightened ruler of the Al Bu Sa'id dynasty, was born near Muscat, about 1791. He was the only sultan of Muscat to establish effective control over Zanzibar, Mombasa, and 660 mi. of coastal East Africa, as well as over the coast of Baluchistan. He was never elected, nor claimed the religious title of, Imam; but he upheld the austere Ibadi sect of Islam as temporal ruler of the sect. Saiyid Sa'id succeeded, with British naval help, in keeping Muscat and Oman independent of the Wahhabi Arabs of Najd (*see* WAHHABI) though he thrice paid them tribute (1833, 1845, and 1853). Family feuds shadowed his life; he was acclaimed Saiyid only after assassinating a traitorous relative. In 1824 he made a triumphant pilgrimage to Mecca.

After establishing permanent residence in Zanzibar in 1837–40, Saiyid Sa'id beautified the island with palaces and expanded Arabian-African trade; he developed clove plantations and experimented with sugar and indigo. He signed a treaty of amity and commerce with the United States (1833) and a commercial treaty with France (1844). His relations with England were close: he signed a treaty of commerce (1839) and two anti-slave trade treaties (1822, 1845) and cooperated with the British in suppressing African-European slave trading (to his own detriment). He also ceded the guano-covered Kuria Muria Islands to Britain (1854). Saiyid Sa'id died at sea on Oct. 19, 1856. *See* also MUSCAT AND OMAN; TANZANIA, UNITED REPUBLIC OF.

SAID PASHA (MOHAMMED SA'ID PASHA) (1822–1863), Ottoman viceroy of Egypt from 1854 to 1863, fourth son of Mohammed Ali Pasha, was born in Cairo on March 17, 1822. Educated privately and in Paris, he succeeded the viceroy Abbas I on July 13, 1854. Ferdinand de Lesseps (*q.v.*), a friend of his youth, then immediately hurried to Egypt and persuaded him to grant a concession empowering De Lesseps to form a company for the construction of the Suez Canal with Egyptian labour. (*See* SUEZ CANAL.) Said continued Abbas' efforts in the Crimean War and in 1854 strongly reinforced the Egyptian contingent with the Ottoman Army. In 1855 he fortified the Nile barrage near Cairo. In the winter of 1856–57 he visited the Sudan where his over-hasty reorganization brought administrative confusion. Self-indulgent, credulous, and generous to a fault, he enjoyed without discrimination the company of European adventurers whose activities were to ruin his successor, Ismail. He borrowed extravagantly in Europe in 1858, 1861, and 1862, and died at Alexandria on Jan. 18, 1863, leaving a foreign debt of over £3,000,000 and personal debts of about £6,000,000. *See* also EGYPT: *History: Modern Period: Abbas I and Said (1848–63).*

See A. Sammarco, *Les Règnes d'Abbas, de Said et d'Ismail (1848–1879)* in *Précis de l'histoire d'Égypte*, vol. iv (1935). (R. L. HL.)

SAIGON, the capital and river port of South Vietnam (Republic of Vietnam) and formerly of French Indochina (*q.v.*), lies about 60 mi. (97 km.) from the South China Sea on the Saigon River, the delta of which merges with that of the Mekong. It forms the easternmost part of an urban district which includes Cholon (*q.v.*) and the northern suburb of Gia Dinh. The population in 1964 was estimated at 1,332,900, including Cholon. The average annual rainfall is 81 in. (2,060 mm.) and Saigon suffers a dusty drought from January to March.

The city is laid out in the French style with boulevards, offices, grand public buildings, fine residences, theatres, shops, and banks, justifying its fame as "the Little Paris of the East." There are many squares and public parks. Among notable buildings are the Romanesque-style cathedral and the Vietnamese museum in the botanical garden. The university was founded in 1917 as the Université Indochinoise and became the University of Saigon in 1955. There are faculties of letters, science, law, medicine, pharmacy, education, and architecture. In addition, there are advanced schools for teaching, arts and crafts, fine arts, and architecture.

Saigon is readily accessible to vessels of up to 30 ft. draft. Quays stretch about three miles along the riverside with bulk-handling facilities for rice, which is the basis of Saigon's trade. Local junks and shallow-draft craft from the Mekong delta bring great tonnages of rice cheaply from the interior for export to China, Japan, the Philippines, and Malaya. Overland communications were constructed during the French administration; these included arterial roads to Hanoi and Hue, to the Laotian Mekong, and to Phnom Penh, Cambodia; and railways to Hanoi and Phnom Penh which still exist. However, the new boundaries which resulted from the partition of Indochina into the separate states greatly reduced the rice export from Saigon, and although the influx of refugees, after the Indochinese War (1947–54), increased the population of the town, its importance as a port diminished. Saigon, however, retains its international air services to Hong Kong, Bangkok, Manila, Singapore, Tokyo, and Calcutta.

Relations with France began in the 18th century when French missionaries were sent to Saigon. In 1859 the town was captured by the French and in 1862 it came under French administration as part of the French colony of Cochin China. In 1932 Saigon and Cholon were merged for administrative purposes to form the prefecture of Saigon-Cholon, which was retitled the prefecture of Saigon in 1956. Saigon became the capital of South Vietnam in July 1954, following the Convention of Geneva, which divided Vietnam *de facto* into two republics. World attention focused on the city as South Vietnam suffered both internal and external strife. The United States maintained headquarters in Saigon for its staffs of military and economic advisers supporting the war effort against North Vietnam. *See* also VIETNAM. (E. H. G. D.)

SAIGŌ TAKAMORI (1827–1877), Japanese rebel, a member of the warrior class and one of the best known of the leaders of the movement that overthrew the Tokugawa shogunate and restored power to the emperor, was born at Kagoshima in Kyushu on Dec. 7, 1827.

On the Meiji restoration in 1868, Saigō immediately assumed an important position in the new government. He left it in 1873, ostensibly over differences within the government on matters of foreign policy—though some historians regard his departure mainly as part of a factional struggle for power under the emperor—and retired to Kagoshima, where he founded a school and gathered around him a group of young men sympathetic to his personality and views on government.

In 1877 Saigō led an uprising, known as the Satsuma Rebellion, intending to replace the existing incumbent government with one headed by himself. His forces were crushed and, rather than fall into enemy hands, he ordered one of his subordinates to put him to death with his sword, Sept. 14, 1877.

Saigō became a national hero despite the rebellion, personifying to the Japanese the loyal subject who risks all to serve the emperor as he sees best. (T. C. SH.)

SAIGYŌ (1118–1190), Japanese Buddhist priest-poet, one of the greatest masters of the 5-line, 31-syllable tanka, whose life and works became the subject matter of many narratives, plays, and

puppet dramas, was born SATŌ NORIKIYO in a samurai family in 1118. The son of an officer in the Imperial Gate Guards, he himself originally followed a military career. Like others of his day, Saigyō was oppressed by the sense of disaster which overwhelmed Japan as the brilliant court life of the Heian era passed into a period of civil wars in the latter half of the 12th century. In his early 20s he chose the way of a priest, leaving behind a life which "try as he might he could not regret." Initially trained in the quietism of the Tendai sect, he passed to Jōdo, with its emphasis on faith, and to the mysteries of Shingon. (*See* BUDDHISM: *Regional Variations in Buddhism: Japan.*) His life was spent in travel throughout Japan, punctuated by periodic returns to the capital at Kyōto to participate in imperial ceremonies. He died at Kōsenji Temple in what is now Ōsaka in 1190.

Informing Saigyō's poetry are the love of nature and devotion to Buddhism. The flowers and the moon recur as constant objects of praise. "Would that I might die in the spring, under the cherry blossoms, at the time of the full moon in the month of May!" His poems, though deceptive because there is a sense of flatness about them, are technically, the work of a master: often a caesural stop comes at the end of the first line of a poem; imperative forms are used, as are questions; the fourth and fifth lines are often parallel in construction, and the vocabulary is unusually complex.

Saigyō left many works, of which the most famous is the anthology entitled *Sankashū,* which contained 1,571 poems when first compiled. His *Mimosusogawa utaawase* ("Poetry Contest at Mimosuso River") is a tour de force in which he pitted his own poems against each other. Attracted to Saigyō's poems were such priest-poets of later times as Ton'a, Sōgi, Bashō, and Jiun.

BIBLIOGRAPHY.—Translations of Saigyō's poetry into English are found in D. Keene (ed.), *Anthology of Japanese Literature,* pp. 195–196 (1955), and in A. Miyamori, *Masterpieces of Japanese Poetry, Ancient and Modern,* pp. 375–392 (1936). (J. K. Y.)

SAIKAKU: *see* IHARA SAIKAKU.

SAILFISH, a large, powerful fish of the open seas, in which the bones of the upper jaw are consolidated and prolonged to form a rounded spear and the dorsal fin is greatly enlarged to form a saillike superstructure. Sailfishes (*Istiophorus* species), closely related to the marlins are classified with them in the family Istiophoridae. Like their relatives, sailfishes are strong and far-ranging swimmers, whose streamlined bodies cut the water at considerable speeds (perhaps 60 m.p.h. for short distances). The upper part of the torpedo-shaped body is a rich blue, the remainder a bright silver; the sides are often marked with vertical lines of lavender dots. The sail, deep purple at the base, blends into dark blue and is more or less spotted with dark dots. The fish folds the sail into a groove on the back when swimming rapidly and unfurls it when sunning itself, when breaking the surface or when fighting a sportsman's line. The spear is perhaps used to stun prey, such as mackerel, sierra, sauries and squid.

CHARLES MEYER—PHOTO RESEARCHERS, INC.

PACIFIC SAILFISH, (ISTIOPHORUS GREYI)

Sailfishes are widely distributed in the warm waters of all oceans and seasonally visit temperate regions as far south as the Cape of Good Hope and as far north as Massachusetts. There is much uncertainty regarding the number of species.

Two well-known species are the Atlantic sailfish (*Istiophorus albicans*), averaging less than 50 lb. in weight, and the Pacific form (*I. greyi*), averaging about 100 lb. Large specimens on record, caught with rod and reel, are an Atlantic sailfish 10 ft., 4 in. long and weighing 123 lb.; and a Pacific form 10 ft., 9 in. and 221 lb. Even though sailfishes are only fair quality as food, they are among the most highly prized of big game fish.

(L. A. WD.)

SAILING: *see* BOATING; RIGGING; YACHTING.

SAILS. The origin of sailcloth is obscure, although it can be assumed that primitive man first used the skins of animals as sails for his raft or canoe. The next probable step was to use woven mats of reeds stretched on poles. Sailcloth is mentioned by Homer in the *Odyssey,* in which he states that Calypso brought Odysseus "a web of cloth to make him sails."

Sailcloth was woven from flax fibre during the period when England, France and Spain were striving for supremacy. Fibre flax grown chiefly in the U.S.S.R. and European countries, is still used for sails, although cotton has replaced it for better quality canvas. Cotton sails became popular in Europe after the U.S. racing yacht "America," using cotton sails, decisively defeated a fleet of British yachts in 1851.

Cotton sailcloth has the advantage over flax, hemp, ramie, jute and combinations of these materials as a fabric in that it can be woven more closely, and therefore will not stretch out of shape as easily nor lose as much wind through the pores of the material. Sails made of cotton, however, are very stiff, which makes them difficult to handle, and many a fingernail has been torn to the quick in furling cotton duck.

The best cotton fibre is grown in the United Arab Republic (Egypt), and sails made of this material are used chiefly aboard the larger sailing yachts. Egyptian cotton is superior to U.S. cotton because the fibres are longer and stronger, and their greater degree of natural twist is conducive to producing a tightly woven fabric.

The chief modern users of quality sailcloth are yachtsmen, who generally prefer dacron (or Terylene, its British equivalent). These synthetic fabrics were first introduced in 1950, and they proved much superior to any type of cotton or other synthetic materials, such as nylon, dynel, Fortisan and Orlon.

Sails made of dacron maintain just the correct amount of stretch and so require no "breaking in" period. The greater strength of the fabric permits the use of lighter weight sails,

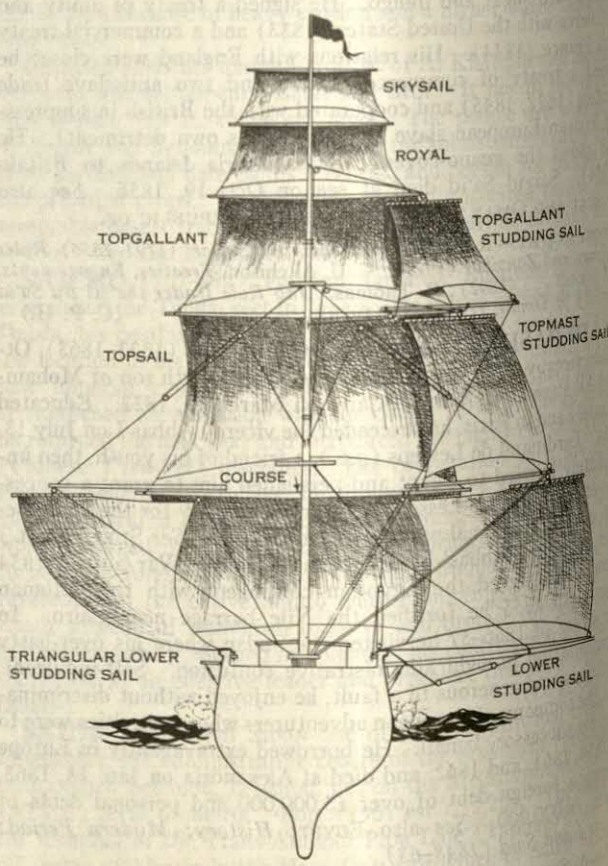

FIG. 1.—SQUARE SAILS

Studding sails are shown with their rigging, seen astern

which maintain their original shape for years. Dacron sails will not mildew except when in contact with mildew on some other object. Because this fabric is heat-treated by pressing it between hot rollers of metal, the fibres are flattened and interlock. This "stabilizing" process gives the fabric a smooth, almost frictionless surface and very little porosity. A slight drawback resulting from this closely woven, smooth surface is that the stitches do not mesh with the fabric but protrude above the surface of the sail, causing the sail twine to become abraded more rapidly than with other sailcloth. Nevertheless, sailmakers seemed convinced that dacron (or Terylene) is a nearly perfect material for racing sails. A possible future development in sail material is a plastic that can be glued together.

Sailmaking.—The basic steps in manufacturing a sail may be outlined as follows: (1) The sailmaker studies the sail plan or measures the vessel's rig. (2) He calculates the stretch and the amount of draft, *i.e.*, the curvature of the surface. (3) The actual plan of the sail is chalked out to full scale on the floor of the sail loft. (4) The cloths are laid down over this plan and their actual length and shape are marked on each individual cloth. (5) The cloths are numbered and then cut to the dimensions outlined by the markings. (6) The cloths are sewn together. If the sail is hand sewn, a flat stitch is used on a double flat seam in which the edge of one cloth overlaps the cloth next to it from $\frac{1}{2}$ to $1\frac{1}{2}$ in., depending on the material. A special sail twine is used as thread, and after the needle is threaded the twine is waxed so it will hold the right-hand twist then given to it. This twist helps the thread to mesh with the fabric. The sailmaker sews from right to left, using a leather palm having a solid thimble attached near the heel of the thumb and a special three-sided sail needle. The cloths are prevented from slipping off the sailmaker's lap by a bench hook attached to the right side of his bench. The size of the sail needle depends on the weight of the material and the type of sewing. For the usual flat stitch, 10 to 12 stitches are taken within the distance corresponding to the length of the needle. (7) After all the cloths are sewn together, patches are attached to the corners

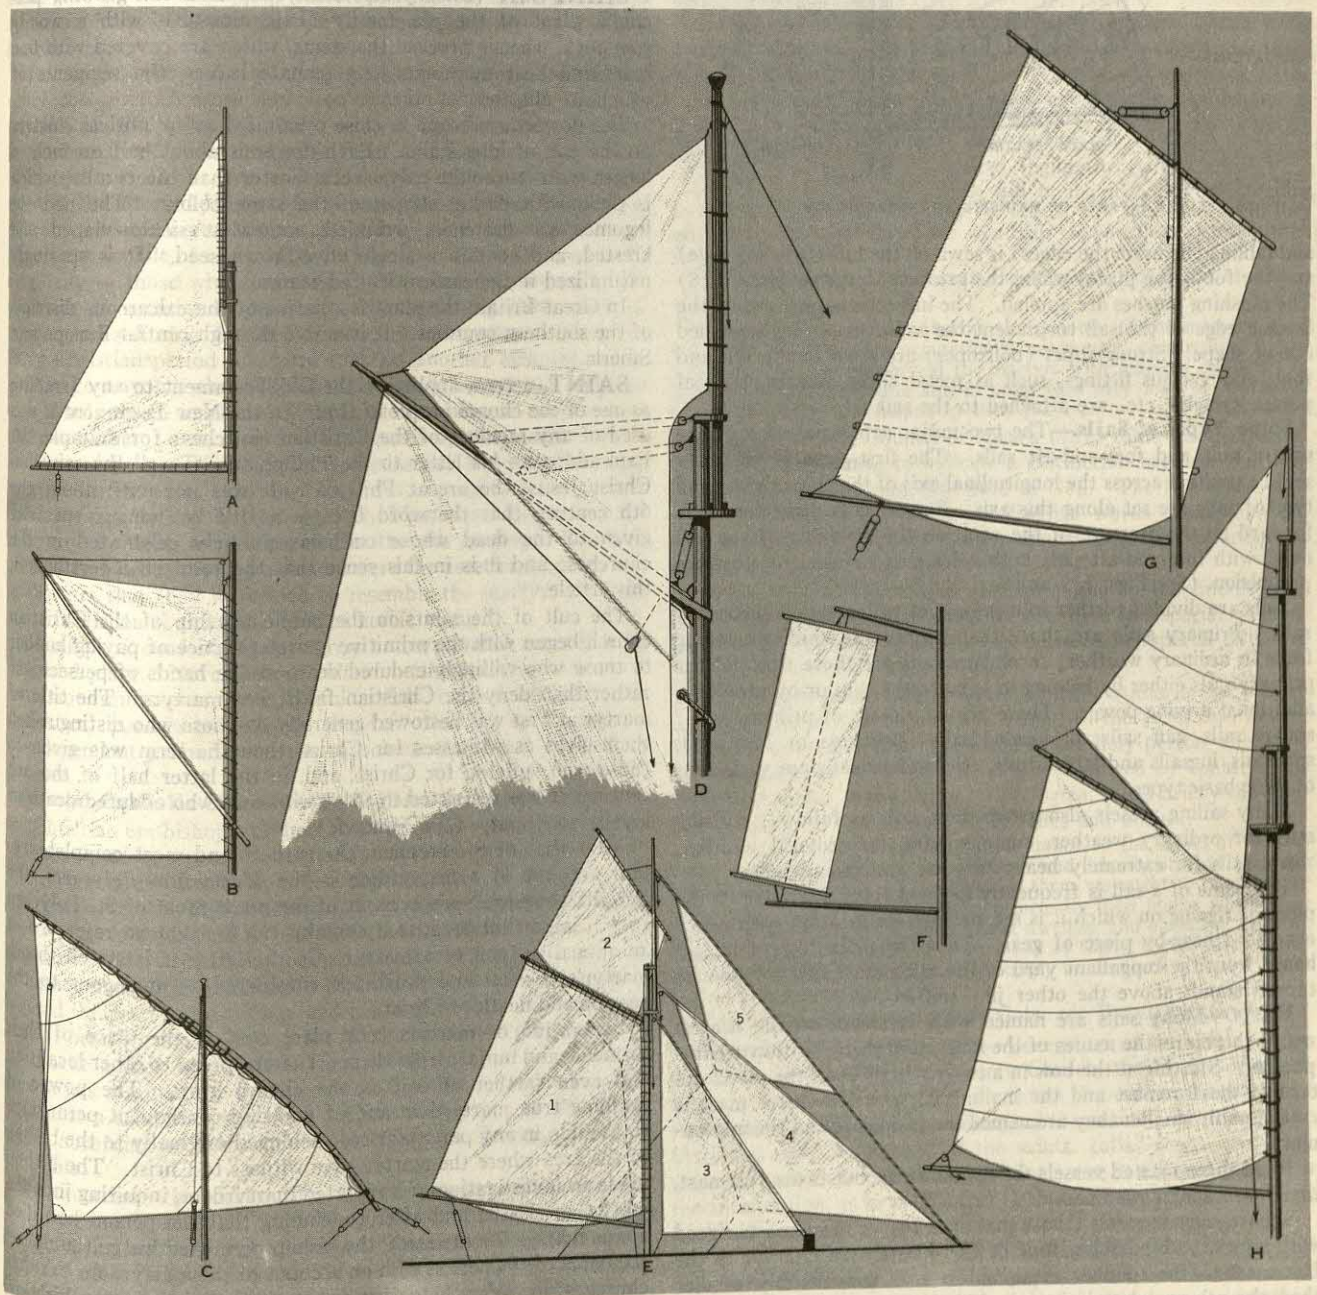

FIG. 2.—FORE-AND-AFT SAILS

(A) Sliding gunter; (B) spritsail; (C) lateen; (D) gaff topsail; (E) rig as used on cutter with (1) mainsail, (2) club-headed gaff topsail, (3) staysail, (4) jib, and (5) jib topsail; (F) ringtail; (G) standing lugsail; (H) loose-footed spanker and jib-headed topsail

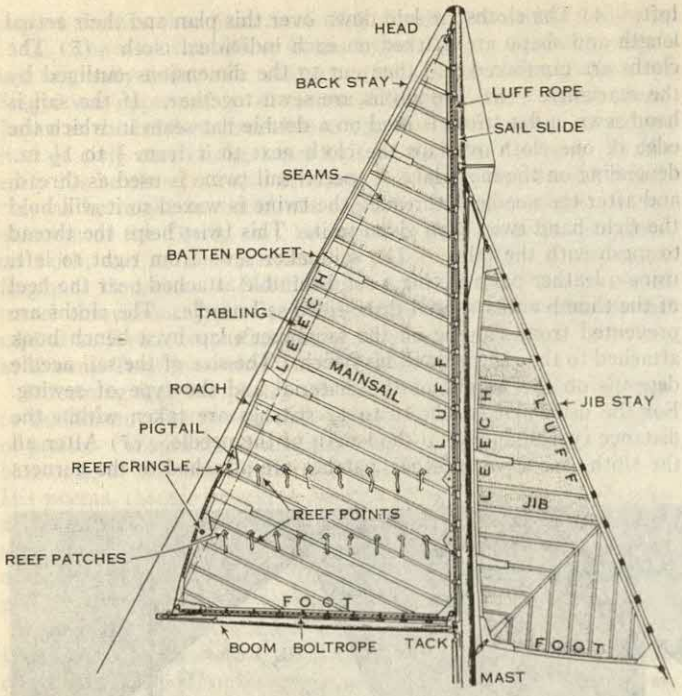

FIG. 3.—PARTS OF MAINSAIL AND WORKING JIB

and tabling (hems on the edges) is sewn on the luff (forward edge) and the foot—the places where the greatest strain develops. (8) The finishing touches are applied. The luff rope is sewn inside the leading edge of the sail to prevent the sail from being stretched out of shape. Strong ropes (boltropes) are sewn to the luff and foot, and various fittings, such as metal slides, grommets, reef points, cringles, etc., are attached to the sail.

Some Types of Sails.—The two major categories of sails are square sails and fore-and-aft sails. The first type is generally set in a position across the longitudinal axis of the ship; the second type of sails are set along this axis. Square sails drive the craft forward by the pressure of the wind on the afterside of the sail only; with fore-and-aft sails both sides may be used for forward propulsion. (*See* Figs. 1, 2 and 3.)

Sails are divided further into groups of primary and secondary sails. Primary sails are those that supply the chief propelling force in ordinary weather; secondary sails are those that aid the primary sails either by helping to balance the ship or by providing additional driving power. There are six classes of primary sails: square sails, gaff sails, jib-headed sails (Bermuda or Marconi), spritsails, lugsails and lateen sails. Secondary sails are variations of these basic types.

Many sailing vessels also group their sails as follows: cruising sails for ordinary weather, summer sails for tropical weather, storm sails for extremely heavy weather and racing sails.

The name of a sail is frequently derived from the name of the piece of rigging on which it is set, or from its location with reference to a near-by piece of gear. Thus the main topgallant sail hangs from the topgallant yard of the main mast (fig. 1), the jib topsail stands above the other jibs and so on.

Masts.—Many sails are named with reference to the nearest mast; therefore, the names of the masts and their location are important. Starting at the bow in a two-masted vessel the masts are termed the foremast and the mainmast; when the after mast is considerably smaller they are named the mainmast and the mizzenmast.

In all three-masted vessels the names of the masts are foremast, mainmast and mizzenmast.

Square-rigged vessels (those that have two or more masts rigged with square sails) having four or five masts usually refer to the last mast as the spanker mast, unless it is considerably smaller than the others, when it is named the jigger mast. There is no fixed rule regarding the names of the masts of square-rigged vessels having five or more masts, though the terms foreward mainmast, after mainmast and middlemast are used. With sails fore-and-aft on vessels having five masts the mast names are: fore, main, mizzen, jigger and spanker.

One authority gives the following names for the masts of a six-masted, fore-and-aft vessel: fore, main, mizzen, jigger, spanker and pusher or driver. For the "Thomas W. Lawson"—the only seven-masted vessel ever built—the mast names are given as fore, main, mizzen, jigger, spanker, pusher and driver. Other authorities state that the seven masts were named for the days in the week, but that this method was later abandoned in favour of numbering from one to seven.

The names and locations of the working sails of a full-rigged ship are illustrated in the article on RIGGING.

See SHIP; *see* also references under "Sails" in the Index.

SAINFOIN (*Onobrychis viciaefolia*) is a low-growing perennial plant of the pea family (Leguminosae), with a woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic.

The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx teeth shorter than the corolla, which is pink, with darker stripes of the same colour. The pods or legumes are flattened, wrinkled, somewhat sickle shaped and crested, and contain a single olive-brown seed. It is sparingly naturalized in the eastern United States.

In Great Britain the plant is a native of the calcareous districts of the southern counties. It is native through central Europe and Siberia.

SAINT, a term applied in the Old Testament to any Israelite as one of the chosen people of God. In the New Testament it was used of any member of the Christian churches; for example, St. Paul addresses his letter to the Philippians "To all the saints in Christ Jesus who are at Philippi." It was not until about the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches; and it is in this sense that the term is understood in this article.

The cult of the saints in the public worship of the Christian church began with the primitive church practice of paying honour to those who willingly endured death at the hands of persecutors rather than deny the Christian faith; *i.e.*, martyrs. The title of martyr at first was bestowed generally on those who distinguished themselves as witnesses for Christ, then the term was given to those who suffered for Christ, and, in the latter half of the 3rd century, it was restricted to those witnesses who endured death in loyalty to Christ. (*See* MARTYR.)

After that of St. Stephen, the earliest and most complete extant account of a martyrdom is the *Martyrium Polycarpi*, the Smyrna congregation's account of the martyrdom of St. Polycarp (*q.v.*), important because it contains the first-known reference to an annual festival of a martyr. In the letter it is stated that a martyr's passion and death are considered as analogous to the passion and death of Christ.

Veneration of martyrs took place first at the place of their torments and burial; from thence it often spread to other localities, and even farther abroad as the church grew. The power of deciding true martyrdom and of granting consequent permission to worship in any particular case belonged originally to the bishop of the area where the martyr gave witness to Christ. The bishop made an investigation of a reported martyrdom, inquiring into the motive of death; and after concluding that the person had died a true martyr for the faith, the bishop permitted his cult and sent the name of the person with an account of the martyrdom to other churches, in order that, with approval of the respective bishops, the worship of the martyr might be carried on in those churches also.

This geographical restriction of cult is evident from explora-

tion of ancient Christian cemeteries in which are found paintings only of martyrs who suffered in the region near the cemetery. At the same time, the practice of notifying other churches explains the rapid and almost universal veneration of certain martyrs, for example St. Lawrence (d. 258) or St. Cyprian of Carthage (d. 258).

At the centre of veneration of the martyrs was the Eucharist, celebrated in an atmosphere of triumph. Often it took place over the tomb of the martyr. Hence, there arose the practice of constructing altars like graves and of providing them with relics. The first churches were dedicated to the martyrs. The word *martyrium*, designating first a church built over the grave of a martyr, later was used for churches in general, even for those churches not dedicated to martyr saints. Even today the relics of the saints that are sealed into every altar stone or antimension (in the Eastern Church, a silk or linen cloth used as a portable altar or as covering for the true altar) must include relics of at least one martyr. The martyr's body was guarded with great care in the beginning, but translation of the remains and severing of the body for relics later came into practice as Greek innovations.

Taking the name of a martyr, as an act of reverence, was another custom that arose and soon became established. St. Dionysius of Alexander (d. 265) relates, for example, that two favourite names in his time were Peter and Paul.

Veneration paid to the martyrs was not given to others—not even to the Blessed Virgin Mary—until later. Thus, veneration of the confessor saints, as they are called (*see* CONFESSOR), is not so ancient as cult of the martyrs. The term confessor was given originally to those who confessed Christ when questioned in the presence of enemies of the faith, thus exposing themselves to danger and suffering, but did not endure martyrdom. After the early Christian period the word took on another meaning, being applied to anyone who had led a life of heroic virtue and had died a holy death in peace. This is the meaning of confessor as understood here; and, according to common opinion, confessors so understood first received public ecclesiastical honour some time in the 4th century. In the east, for example, Hilarius and Ephraem Syrus, and in the west St. Martin of Tours and St. Hilary of Poitiers, were venerated in the 4th century. The first persons to be considered confessors were the ascetics, perhaps due to the fact that they were seen to resemble the martyrs by their acts of self-denial and their lives of heroic virtue.

Worship of confessor saints grew and expanded according to time and place. Nevertheless, cult of neither martyr saints nor confessor saints was ever lawful unless carried on with ecclesiastical permission, despite the fact that in both cases it was dependent primarily on the consciousness of the faithful as a whole.

Roman Catholic Church.—Throughout the 1st millennium of the Christian era bishops on their own authority could allow public veneration of martyrs or confessors for determined localities. (In certain areas, however, it was a prerogative of the primates and patriarchs.) This was carried on even beyond the 12th century, as is evidenced by the fact that in 1215 Peter of Trevi was canonized by the bishop of Anagni. According to the present discipline in the Roman Catholic Church, however, canonization is beyond the power of a bishop, and it is a procedure distinct from that of beatification, a stage prior to canonization. Canonization, as taught today, is a solemn declaration by the pope that a person has attained the beatific vision and that veneration of the person as a saint is imposed on the entire church. In this judgment, according to the common doctrine, the Roman pontiff is infallible.

Beatification—the declaration that a person is blessed—on the other hand, is not an infallible judgment, and it grants only restricted authorization to venerate. Beatification, thus, implies a permission, while canonization connotes a precept that is universal. The medieval centuries had no such distinct procedures. The titles *beatus* and *sanctus*, technically different in meaning and application in the Roman Catholic Church today, were used with no distinction in the middle ages.

The history of the development of law concerning canonization and beatification, and the procedures laid down in the Code of Canon Law, are described in the article CANONIZATION.

Dogmatically the veneration of saints in the Roman Catholic Church can be understood only in the light of the dogma of the unique mediatorship of Jesus Christ (I Tim. 2:5). Jesus Christ alone, according to Roman Catholic teaching, redeemed men by his death on the cross. Furthermore, no divine gift can come to man except through man's Redeemer. Hence, all the prayers of those on earth and of the saints in heaven are efficacious only through Christ.

The saints, who are specially pleasing to God, join their prayers to the prayers of those who invoke them, and their aid to men is through the merits of Christ, man's Redeemer and one Mediator. The Council of Trent states it thus:

> The saints, reigning together with Christ, pray to God for men. It is a good and useful thing to invoke the saints humbly and to have recourse to their prayers and to their efficacious help to obtain favors from God through His Son Jesus Christ, Our Lord, who alone is our Redeemer and Savior.

Intercession of the saints was unanimously taught by the early Fathers. For example, St. Cyril of Jerusalem, in his *Catecheses*, says:

> We then commemorate those who have fallen asleep before us, patriarchs, prophets, Apostles, and martyrs, in order that God, by their prayers and intercessions, may receive our petitions.

St. Jerome, in his work against Vigilantius, writes:

> If apostles and martyrs, while still in the flesh and still needing to care for themselves, can pray for others, how much more will they pray for others after they have won their crowns, their victories, their triumphs.

And against the Manichaean Faustus, St. Augustine of Hippo states:

> Faustus blames us for honoring the memory of the martyrs, as if this were idolatry. The accusation is not worthy of a reply. Christians celebrate the memory of the martyrs with religious ceremony in order to arouse emulation and in order that they may be associated with their merits and helped by their prayers.

From the second Council of Nicaea (787) came the theological terms *dulia* and *latria* to indicate a distinction between the worship paid the saints and that paid to God. The two terms correspond, more or less, with the English words veneration and adoration. *Latria* is the worship reserved to God alone and *dulia* is worship given to the saints.

Another term, *hyperdulia*, was composed in the middle ages as a technical theological word to designate the special worship paid to the Blessed Virgin Mary because of her special gifts and holiness bestowed on her by God.

Closely connected with veneration of the saints in the Roman Catholic Church is the cult that is paid to the relics and images of saints, a worship that is referred to the holy person whom the image represents or to whom the relic belonged by contact. St. Thomas Aquinas, in the *Summa Theologica*, states briefly the principle underlying this veneration of relics and images:

> It is manifest that we should show honor to the saints of God as being members of Christ, the children and friends of God and our intercessors. Wherefore in memory of them we ought to honor every relic of theirs in a fitting manner: principally their bodies which were temples and organs of the Holy Ghost dwelling and operating in them, and as destined to be likened to the body of Christ by the glory of the Resurrection. Hence God himself fittingly honors such relics by working miracles at their presence.

(For liturgical veneration of saints, *see* BREVIARY: *Contents*.)

Orthodox Eastern Church.—Veneration of the saints is also a practice in the Orthodox Eastern Church, the liturgy of which takes account of the feasts of the saints throughout the year and establishes the manner of celebrating the feasts. Moreover, the Orthodox venerate images of the saints, called icons, and they show reverence to the relics of saints; the latter are placed in the antimension, as in the Roman Catholic Church they are placed in the altar stone.

The teaching of the Eastern Church concerning the state of those who have passed out of this world is different from that of the Roman Catholic Church. Though the Orthodox pray for their dead and offer prayers to the saints, the church teaches that all the dead are asleep, awaiting the coming of the Day of Judgment,

when the good will receive their reward of heaven and the wicked will be judged deserving of hell. The saints too appear to be in this middle state, although they are invoked. In fact, prayers to the saints play as large a part in Orthodox as in Roman Catholic devotions, and stories of miraculous apparitions of the Blessed Virgin Mary and of the saints are equally numerous.

The process of canonization in the Orthodox Eastern Church is less juridical than that in the Roman Catholic Church (*see* CANONIZATION).

The Menaion, a liturgical work of 12 volumes (one for each month) contains the proper of the immovable feasts of Christ and the saints, corresponding to the *Proprium Sanctorum* of the Roman Catholic breviary. For each day, it includes a *synaxarion*, a short narrative of the life of a saint or exposition of a feast, taken from the menology (a liturgical book containing the lives of the saints, arranged by months) and read after the sixth ode of the canon for the day.

The Eastern Church also celebrates the Feast of All Saints, on the Sunday after Pentecost. In the churches representations of the saints are found on the iconostasis (the screen separating the sanctuary from the nave); in private homes icons are used.

The saint that occupies the first place of honour among the Orthodox, after the Blessed Virgin, is St. John the Baptist, venerated as the precursor of Our Lord. Greatly beloved, and particularly so in the Russian Church, is St. Nicholas, the saint who helps those in need. The protector of trade, virginity and the family is St. Paraskeva. Among the modern saints is the Russian St. Seraphim of Sarov (canonized in 1903), who is held in special honour.

Anglican Communion.—Teaching in regard to worship and invocation of saints is one of the distinguishing differences between the Roman Catholic Church and the churches of the Reformation. According to Protestant doctrine, worship of the saints tends to detract from the position of Christ himself. Though the churches of the Reformation do not teach the nonexistence of saints, they maintain that to pray to the saints and to ask their intercession is to contradict the commands of our Lord when he taught us how to pray directly to the Father. The saints should be considered ideal examples of the faith, but men ought not to invoke their intercession by name.

The Anglican Church, like other churches of the Reformation, rejects doctrinally the worship and invocation of the saints. Its teaching and faith are contained in the Thirty-Nine Articles drawn up under Queen Elizabeth I in 1562 and amplified by the Book of Common Prayer. Article xxii states:

> The Romish doctrine concerning purgatory, pardons, worshipping and adoration, as well of images as of relics, and also invocation of saints, is a fond thing, vainly invented, and grounded upon no warranty of Scripture, but rather repugnant to the Word of God.

Nevertheless, Anglican doctrine allows the *veneration* of the saints provided veneration does not become worship or invocation. On the one hand, there is no solid reason for stating that the departed saints cannot hear our prayers, if no solid reason for stating that they can; hence a private practice of addressing them cannot be condemned. It cannot be known whether or not they know individual men on earth, for there is no revelation or other knowledge on this matter. Thus, honour can be given to the saints, and Anglicans pray that they may "follow the blessed saints in all virtuous and godly living."

Under the influence of the Oxford movement, veneration of saints was revived in the Church of England. Nor are the Thirty-Nine Articles considered representative of the ritual and doctrinal position of the Protestant Episcopal Church in America, despite the fact that they are included in the American Book of Common Prayer.

In the Episcopal Church some teach that the saints do intercede for men; moreover, the saints bear witness to man's efforts to serve God on earth, and they aid men by their prayers.

Patron Saints.—During the middle ages the practice arose of bestowing on a saint honour for possessing definite attributes and then of considering the saint as an intercessor with special power regarding particular human needs. Thus, the saints became, in time, special patrons even of countries, cities and vocational groups. This practice of patron saints has continued.

A group of 14 saints, the auxiliary saints or holy helpers, are venerated for the efficacy of their prayers on behalf of human necessities. They are: St. George (April 23); St. Blaise (Feb. 3); St. Erasmus (June 2); St. Pantaleon (July 27); St. Vitus (June 15); St. Christopher (July 25); St. Denis (Oct. 9); St. Cyriacus (Aug. 8); St. Acacius (May 8); St. Eustace (Sept. 20); St. Giles (Sept. 1); St. Margaret (July 20); St. Barbara (Dec. 4); and St. Catherine of Alexandria (Nov. 25).

In addition to the auxiliary saints, there are many others who are invoked for special needs, among them St. Peregrinus Laziosi (May 1), cancer patients; St. Dympna (May 15), the mentally ill; St. Anne (July 26), women in labour; St. Ottilia (Dec. 13), the blind; St. Roch (Aug. 16), invalids.

Patron saints exist also for various occupations: St. George (April 23), farmers; St. Florian (May 4), firemen; St. Andrew (Nov. 30), fishermen; St. Apollonia (Feb. 9), dentists; St. Ferdinand III (May 30), engineers; St. Francis de Sales (Jan. 29), journalists; St. Thomas More (July 9), lawyers; St. Albert (Nov. 15), scientists; St. Barbara (Dec. 4), miners; St. Luke (Oct. 18), physicians; St. Michael (Sept. 29), policemen; St. John Baptist de la Salle (May 15), teachers.

Most nations also have one or more patron saints, examples being: the Immaculate Conception (Dec. 8), United States; St. George (April 23), England; St. Andrew (Nov. 30), Scotland; St. David (March 1), Wales; St. Patrick (March 17), Ireland; St. Denis (Oct. 9), France; St. Boniface (June 5), Germany; St. James (July 25), Chile; Our Lady of Lujan (May 3), Argentina; St. Francis of Assisi (Oct. 4), Italy; St. Joseph (March 19), Canada; St. Lawrence (Aug. 10), Ceylon; St. James (Santiago de Compostela; July 25), Spain; Our Lady of Guadalupe (Dec. 12), Mexico. St. Benedict of Nursia (March 21; July 11) was proclaimed patron saint of all Europe in 1964.

The literature dealing with the lives and legends of the saints is discussed in the article HAGIOLOGY. The great collection known as the *Acta Sanctorum* is dealt with in BOLLANDISTS.

(W. J. EL.)

SAINT ALBANS, HENRY JERMYN, EARL OF (*c.* 1604–1684), English courtier and favourite of Henrietta Maria, queen of Charles I, was the son of Sir Thomas Jermyn of Rushbrooke, Suffolk. He became M.P. for Bodmin in 1625 and for Liverpool in 1628, in which year he entered Henrietta Maria's household as vice-chamberlain. He became her master of horse in 1639. A member of the Short Parliament for Corfe Castle, Dorset, in 1640, he was implicated in the army plot of 1641, by which certain royalists planned to intimidate Parliament by a show of force, and early in the Civil War he was engaged in several military exploits for the king. He was created Baron Jermyn in September 1643. After accompanying the queen to France in 1644 he was made governor of Jersey (January 1645) but rarely visited the island. He later proposed the sale of the Channel Islands to France in exchange for military assistance for Charles I. Lord chamberlain to Henrietta Maria in 1645, his influence with the queen (sufficient for rumour later to credit him with being her husband) secured his creation as earl of St. Albans by Charles II in April 1660. Although he held several English court appointments after the Restoration (May 1660), St. Albans spent much time in France, where as ambassador extraordinary in 1669 he helped to arrange the secret Treaty of Dover (1670) between Charles II and Louis

XIV. In 1665 he obtained the freehold of land near St. James's Palace, Westminster (where Jermyn Street and St. Albans Street now preserve his name) and developed the area between St. James's Street and the Haymarket which included St. James's Square and Market. St. Albans was well known as a gambler and a glutton, and Andrew Marvell's satirical portrait of him in his poem "Last Instructions to a Painter" (lines 29–48. *Poems and Letters*, edited by H. M. Margoliouth, volume 1, 1952) includes a description of him as "full of soup and gold." St. Albans died in London on Jan. 2, 1684. (H. G. Ro.)

SAINT ALBANS, a cathedral city, market town and municipal borough in the St. Albans parliamentary division of Hertfordshire, Eng., 19 mi. N.N.W. of Marble arch, London, by road, centred on the junction of Watling street with the road from London via Barnet to the midlands. Pop. (1961) 50,293. Area 8.0 sq.mi. The diocese of St. Albans covers Hertfordshire and Bedfordshire.

The city is named after the first English martyr, St. Alban, and the Abbey church (cathedral) stands on the hill which is the traditional site of the martyrdom, *c.* A.D. 303. The present church, built after the Conquest by Paul de'Caen (1077) of Roman bricks from the ruins of nearby Verulamium (*q.v.*), succeeded the Saxon church of the monastery founded by Offa of Mercia, about 793, on the site of a still earlier church. The most famous Saxon abbot was Ulsinus who, in 948, founded three churches, St. Stephen's, St. Michael's and St. Peter's, planned and laid out the town, and founded the market which is still held. The school (not a monastic school) was already flourishing by 1100, and an early headmaster was Alexander Neckam (*q.v.*), foster brother of Richard I. Nicholas Breakspear, afterward Pope Adrian IV, was the son of an abbey tenant. The church was reconsecrated in 1116. Of this church, the tower, the transepts and the east end of the nave remain. The west front and part of the nave were pulled down for rebuilding by John de Cella (1195–1214), but his money was exhausted and the work was completed by his successor, William de Trumpington, in Early English style. During the second half of the 13th century, the Lady chapel and the sanctuary were built, but in 1323, five Norman pillars on the south side of the nave, the roof of the south aisle and part of the cloisters collapsed. This part of the abbey was repaired in Decorated style. The high altar screen was completed in 1484 by William Wallingford, though it was probably commenced by John Wheathampstead or Bostock, friend of Humphrey, duke of Gloucester, who is buried in the abbey. After the Dissolution, the school was housed in the Lady chapel, and remained there until a jail was built in St. Albans, and the prisoners transferred from the Great gateway, which had been used as the town jail. The school took over this building in 1871 and it still remains part of the premises. By the 19th century, the abbey was in urgent need of restoration, and this was carried out, first by Sir George Gilbert Scott, and then a more extensive reconstruction was financed by Lord Grimthorpe. His alterations have been much criticized, but they made the structure safe. The extreme length of the abbey is 550 ft., while the nave, 292 ft., is the longest Gothic nave in Christendom.

The abbey played a large part in English history. As their power grew, the abbots obtained the right to destroy the Saxon royal borough of Kingsbury, on a neighbouring hilltop, and it finally disappeared in the reign of Stephen. The constant visits of kings and nobles, English and foreign, led to the development of a famous school of history, in charge, first, of Roger of Wendover, and later, of Matthew Paris. In 1213, the first draft of Magna Carta was read to an assembly of clergy and nobles in the abbey by Archbishop Stephen Langton. Later the town was occupied by troops of the dauphin. After the battle of Poitiers, the captured King John of France was held in the abbey as a prisoner until his ransom was paid. In the time of the Peasants' revolt, 1381, the Great gate of the monastery was stormed by the townsfolk, and Abbot Thomas de la Mare was forced to grant a charter, which was later revoked when the revolt collapsed. John Ball, the famous preacher, was executed at St. Albans. The clock tower, a town belfry almost unique in England, was built between 1402 and 1411, but the bell is older. During the Wars of the Roses, two battles were fought at St. Albans (*see* ROSES, WARS OF THE). In 1455 Richard, duke of York, defeated the Lancastrians there. In 1461 Henry VI's queen, Margaret of Anjou, routed Richard Neville, earl of Warwick (who was then fighting for the Yorkists) and allowed her troops to sack the town.

Like other abbeys, St. Albans declined in wealth and importance during the late 15th and early 16th centuries. Cardinal Thomas Wolsey was for a time abbot but never visited the abbey. It was dissolved in 1539 and St. Albans became a borough, its first charter being dated 1553. The Gorhambury lands of the abbey came eventually into the possession of Sir Nicholas Bacon, lord keeper to Elizabeth I, who visited him there several times. His son, Sir Francis Bacon, Baron Verulam, is commemorated by a statue in St. Michael's church, which is within the site of Verulam and contains much ancient work. During the Civil War, the town was the headquarters of the army of the earl of Essex.

Sarah Jennings, later duchess of Marlborough, was baptized in the abbey and spent many years; both as a girl and with her husband, John Churchill, at her family home in St. Albans, founding some still existing almshouses. In the 18th century the town became notorious for bribery and corruption at parliamentary elections, and in 1852 the separate borough representation was abolished. The diocese was formed in 1877 and St. Albans became a cathedral city.

Many old buildings are to be seen in the streets, though many others have been pulled down or altered in the 20th century. The most important industry is printing. One of the earliest printing presses was set up in the town by the "Scolemaster Printer," and operated from about 1479 to 1486. One of his books, *The Book of St. Albans*, contains the first example of colour printing in England. Other local trades are horticulture (seeds and orchids), musical instruments, clothing, electrical apparatus, chronometer making and a large variety of other light industries.

SAINT ALDWYN, MICHAEL EDWARD HICKS BEACH, 1ST EARL (1837–1916), English statesman, chancellor of the exchequer from 1885 to 1886 and from 1895 to 1902, was born in London on Oct. 23, 1837, the son of Sir Michael Hicks Beach, 8th bart., and was educated at Eton and Christ Church, Oxford. Succeeding as 9th bart. in 1854, Hicks Beach became Conservative M.P. for East Gloucestershire in 1864, retaining the seat until 1885; thereafter he represented West Bristol until 1906. He held minor office under Benjamin Disraeli (later earl of Beaconsfield) in 1868, and was appointed chief secretary for Ireland in 1874, joining the Cabinet two years later. In 1878 Beaconsfield promoted him to the Colonial Office, where he remained until the government's resignation in 1880.

During the Conservative dissensions between the supporters of Lord Randolph Churchill and the marquess of Salisbury after 1880, Hicks Beach emerged as an influential figure, and became chairman of the party organization in the reconciliation of 1884. Chancellor of the exchequer and leader of the Commons in Salisbury's caretaker government of 1885, he surrendered both positions to Churchill when Salisbury's second ministry was formed in July 1886, becoming instead chief secretary for Ireland. Resigning in 1887, largely for reasons of health, he returned to the Cabinet to serve as president of the Board of Trade (1888–92). From 1895 until 1902, when he retired with Salisbury, he proved an efficient and authoritative chancellor of the exchequer, who insisted upon increased taxation to help finance the South African War (1899–1902). Though an orthodox free trader, he revived certain duties for revenue purposes. The controversy over his corn tax of 1902 was the occasion in the following year for the start of Joseph Chamberlain's tariff reform campaign, against which Hicks Beach fought bitterly. Created Viscount St. Aldwyn in 1906, he played little further part in politics. His earldom was

conferred in 1915, and he died in London on April 30, 1916.

Hicks Beach was a highly respected member of his party, regarded as stern and austere, especially during his last years at the treasury. However, his nickname, "Black Michael," referred to his appearance rather than his character. He was considered an "old Tory" on most questions except Ireland, but he was nevertheless an arbitrator much in demand in industrial disputes.

See V. A. Hicks Beach, *Life of Sir Michael Hicks Beach*, 2 vol. (1932). (A. F. T.)

SAINT-AMANT, MARC ANTOINE DE GÉRARD, SIEUR DE (originally ANTOINE GIRARD) (1594–1661), French poet, and one of the original members of the Académie Française, was born at Rouen *c.* Sept. 30, 1594, the son of a merchant. Of Huguenot stock, he was converted to Catholicism. By his own account he traveled to America and Africa; and visits to Italy and England inspired the fierce satires *La Rome ridicule* (1643) and *L'Albion* (1644). He died in Paris on Dec. 23, 1661.

Saint-Amant is remembered for poems in praise of eating and drinking (*e.g., Le Fromage, La Vigne, Le Melon*); these are Rabelaisian in their wealth and crudity of vocabulary, and show a sense of the beauty of material objects. His best works, however, are those combining natural description (often of the sea), mythology, and supernatural horrors—*La Solitude, Le Contemplateur*, and, especially, the four sonnets on the seasons, in which his imaginative qualities are revealed with peculiar intensity. The epic *Moïse sauvé* (1653), on the life of Moses, shows the same qualities, but his vivid grasp of detail found its best expression in smaller compass.

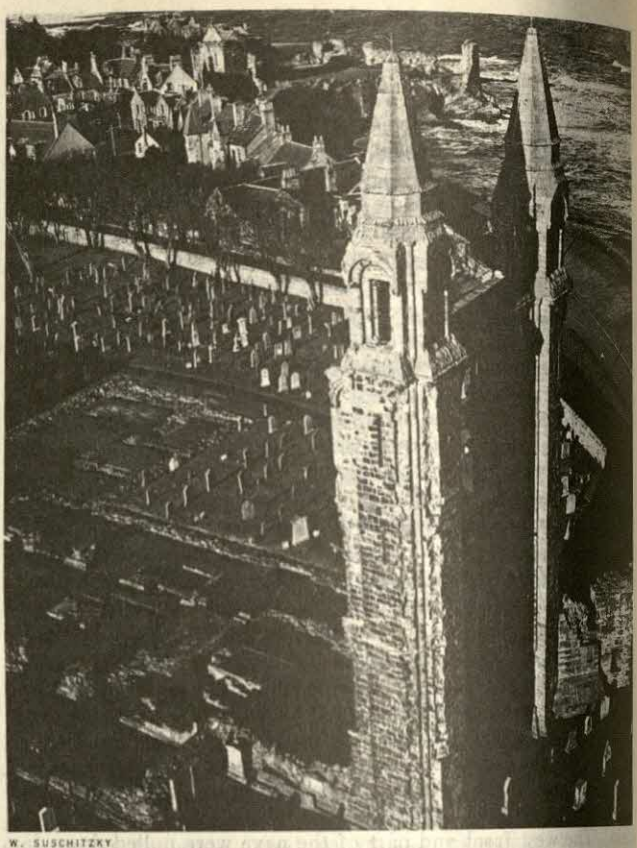
SAINT ANDREWS, a city, royal burgh, university town and seaport of Fife, Scot. Pop. (1961) 9,882. It is on a bay of the North Sea, 13 mi. SE of Dundee by road and ferry. It occupies a plateau of sandstone rock about 50 ft. high, breaking off on the north in precipitous cliffs. The Eden enters St. Andrews Bay northwest of the golf links, which rank among the finest in the world.

St. Andrews originated in a Celtic ecclesiastical settlement that may have been first formed by St. Kenneth in the 6th century. In the 8th century a new church was built by Angus MacFergus, king of the Picts, and dedicated to St. Andrew, who was adopted as the patron saint of the Pictish and thereafter of the Scottish nation. Relics of the saint were brought there and acquired such celebrity that the place, first called Mucross ("the headland of the wild boar") and then Kilrymont ("the cell of the king's mount"), came to be known as St. Andrews. About 908 the bishop of the Scots transferred his seat there from Dunkeld. In the early 12th century the bishopric of St. Andrews was regarded as the most important in the kingdom and was in due course raised to the dignity of an archbishopric in 1472 when its holder was recognized as primate of Scotland.

The medieval cathedral and priory of St. Andrews began with a foundation of Augustinian canons established between 1127 and 1144 by Bishop Robert in association with the so-called church of St. Regulus that still survives. In 1160 a larger cathedral and priory church was begun by Bishop Arnold and eventually consecrated in 1318. Built partly in the Norman and partly in the early Gothic style it was considerably the largest church in Scotland with an internal length of 357 ft. The cathedral and priory were enclosed by an elaborate precinct wall. In addition to the Augustinians, St. Andrews in the Middle Ages contained communities of Dominicans (*c.* 1275) and Observantine Franciscans (*c.* 1450). The bishops and archbishops resided in a formidable castle founded on a rocky headland to the northwest of the cathedral in about 1200 by Bishop Roger. An organized municipality or burgh was founded by Bishop Robert about 1140.

St. Andrews was granted most of the privileges of a royal burgh by King Malcolm IV about 1160 and grew into one of the largest towns in medieval Scotland. The parish church of the Holy Trinity was rebuilt to a commensurate scale on a central site in 1410 by Bishop Henry Wardlaw.



W. SUSCHITZKY

CHURCHYARD AND RUINS OF ST. ANDREWS CATHEDRAL

As the ecclesiastical capital of the country, St. Andrews was the centre of many of the most critical episodes in the Scottish Reformation. After the triumph of the Reformers in 1560 the cathedral and priory were abandoned and fell into ruins but the town remained a place of considerable importance until the close of the 17th century. In the 18th century it underwent a serious decline from which it was rescued mainly through the activity of Sir Lyon Playfair, provost from 1840 to 1861. Already well-known as a golfing centre, especially since the foundation of the Royal and Ancient Club in 1754, St. Andrews acquired the favourable reputation as a holiday resort which it still retains. During the 20th century it consolidated its position as an educational centre and as the commercial and administrative focus of the adjoining region of Fife. St. Andrews is the seat of a presbytery of the Church of Scotland and gives its name to a bishopric of the Scottish Episcopal Church (but combined with Dunkeld and Dunblane and with its seat at Perth) and to an archbishopric of the Roman Catholic Church (but combined with Edinburgh and with its seat in the latter city).

Of the buildings of the medieval city comparatively little remains. The cathedral largely vanished apart from the east and west gables and part of the south wall, but the priory precinct wall was preserved throughout practically its entire length. Also to be seen are the north transept (1525) of the Dominican Church and a great part of the castle. Holy Trinity Church, after undergoing considerable alteration in 1799, was well restored in 1907–09 and is one of the most impressive churches in Scotland. The town is notable for its wide and handsome streets and retains many interesting domestic buildings of the 16th and 17th centuries and the fine gateway of the West Port (1589).

The University of St. Andrews, the oldest in Scotland, owed its origin to a society of scholars formed in 1410. A charter of incorporation was issued in 1412 by Bishop Wardlaw and in 1413 the full privileges of a university were conferred by the antipope Benedict XIII. The first buildings consisted of a "College and Chapel of St. John" appropriated to the use of the university in 1419 and in 1430 associated with a "Pedagogy" on an adjacent site. In 1450 St. Salvator's College was founded and

richly endowed by Bishop Kennedy. In 1512 St. Leonard's College was established and between 1537 and 1554 the early Pedagogy was erected into St. Mary's College. Following the Reformation, in 1579, St. Mary's College was assigned to the study of theology and in 1747 the other two colleges were combined as the United College of St. Salvator and St. Leonard. University College, Dundee, founded in 1881, was in 1897 affiliated to the University of St. Andrews and in 1954 (following the act of 1953) joined with the University Advanced Medical School (1898) and Dental School (1914) as a constituent college of the university entitled Queen's College.

In 1892 women were admitted to all courses of instruction in the university.

The buildings of the university include the splendid tower and church of St. Salvator's College, the church of St. Leonard's College, and the courtyard of St. Mary's College, all of which date from the Middle Ages. The University Library, which was refounded by King James VI in 1612, is partly housed in the original building, within which the Scottish Parliament met in 1645. The library contains over 400,000 printed books, some of great rarity, and important collections of manuscripts. The university expanded greatly during the 20th century and by the early 1960s included some 3,000 students, of whom approximately half pursued their studies in St. Andrews itself and the remainder in Dundee.

SAINT-ARNAUD, ARMAND JACQUES LEROY DE (1798–1854), French army officer and later marshal of France, who distinguished himself in Algeria, was minister of war under Louis Napoleon, and commander in chief of the French forces in the Crimean War. He was born in Paris on Aug. 20, 1798, the son of a prefect named Leroy. His full name is self-styled.

In March 1833 he became aide-de-camp to Gen. Bugeaud de la Piconnerie, whose protection thenceforth made his career easier. On obtaining an appointment to the Foreign Legion, he went to Algiers in January 1837.

Rising rapidly in rank, he served for a time at Metz before returning to Algeria in 1841 when Bugeaud became governor-general. He was on leave in Paris when the revolution of February 1848 broke out, and tried in vain to save the monarchy. Having returned to Algeria in 1851 as major general, he was appointed commander of the province of Constantine. In the autumn of 1851 he was made minister of war. He thus played a decisive part in the *coup d'état* of December 1851, and Napoleon III rewarded him by creating him a senator and a marshal of France. In 1854 he relinquished his ministerial post, and, although seriously ill, he took command of the French forces in the Crimea, planning the landing at Evpatoria (Sept. 14). With the assistance of the British forces under Lord Raglan, he won the Battle of the Alma (Sept. 20). Returning to France, he died at sea on Sept. 29, 1854.

SAINT ASAPH, a cathedral village-city of Flintshire, north Wales, on the Chester-Holyhead trunk road, and 15 mi. W of Flint by road. Pop. (1961) 9,479. Its Welsh name, Llanelwy, is derived from the Elwy, between which river and the Clwyd it stands. Asaph, to whom the cathedral (the smallest in Great Britain, excluding converted parish churches) is dedicated, was bishop there in the 6th century. The small, irregularly built town also has a parish church, remains of a Perpendicular chapel near Ffynnon Fair (St. Mary's Well) and almshouses founded in 1678 by Bishop Isaac Barrow. The hill on which St. Asaph stands is Bryn Paulin, with early associations. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the raids of Owen Glendower (*c.* 1402). Bishop Richard Redman's building (*c.* 1480) was completed by the erection of the choir about 1770. Further restoration took place in the 19th century. The church is plain, cruciform, chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2,000 volumes, some of which are rare and which include the Welsh translation of the Bible by Bishop William Morgan, who is buried in the cathedral. In 1920 the bishop of St. Asaph was enthroned in his cathedral as the first archbishop of the disestablished Church in Wales.

SAINT AUGUSTINE, a city of Florida, U.S., the oldest city in the U.S., and the seat of St. Johns County, is in the northeastern part of the state 75 mi. S of the Georgia border, on the Intracoastal Waterway. It is connected with Anastasia Island on the Atlantic Ocean by the Bridge of Lions across Matanzas River and is served by the Florida East Coast Railway, which also has its headquarters and shops there.

In 1564 France established Fort Caroline near the mouth of the St. Johns River. A year later, in order to defend and maintain Spanish sovereignty over Florida, Adm. Pedro Menéndez de Avilés destroyed the French colony and founded St. Augustine. Throughout the following 256 years it was the northernmost outpost of the Spanish colonial empire except for 20 years, 1763–83, when Florida belonged to England.

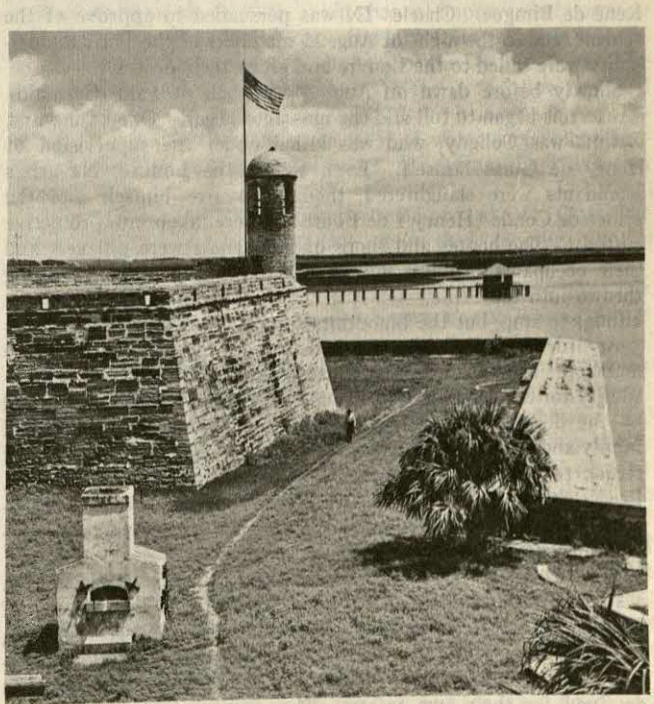
Since 1821 it has been a part of the United States. A plaza, narrow streets, stucco houses, balconies, patios, and gates from the wall that once protected the town are evidences of its heritage. A symbol of Spanish power is the grim and massive Castillo de San Marcos, a rectangular bastioned fortress with walls 30 ft. high and from 9 to 12 ft. thick, surrounded by a moat 40 ft. wide.

St. Augustine was plundered by Sir Francis Drake and besieged by James Oglethorpe; it became a refuge for Loyalists during the American Revolution and during the Indian wars provided a prison for captured Seminoles, including Osceola. The Federals occupied it the last three years of the American Civil War.

In the 1880s Henry M. Flagler (*q.v.*) became interested in developing the east coast of Florida as a resort area. Among the structures he erected in St. Augustine were the luxury hotel Ponce de Leon, and the Memorial Presbyterian Church, both designed by the architects John M. Carrère and Thomas Hastings.

St. Augustine is the site of a Roman Catholic cathedral and of the oldest Episcopal church in the state. The city has had a council-manager form of government in effect since 1915. There are numerous shrines and museums. The economy is based on tourism, commercial fishing, and some industry.

For comparative population figures *see* table in FLORIDA: *Population.* (A. J. H.)



EWING GALLOWAY

CASTILLO DE SAN MARCOS (*c.* 1672), THE OLDEST FORT STANDING IN THE UNITED STATES

SAINT AUSTELL, a market town and urban district in the Truro parliamentary division of Cornwall, Eng., 11½ mi. SSW of Bodmin by road. Pop. (1961) 25,074. Area 28.7 sq.mi. To the north, the high ground on which St. Austell stands culminates in Hensbarrow Beacon (1,027 ft.). The town is the centre of the china clay (kaolin) district, and many people are employed in the industry, exports being made to the Potteries and Lancashire and abroad; huge white spoil heaps abound.

Nearby is Menacuddle Well, a good example of an Early English baptistery. The harbours of Mevagissey, Par, and Charlestown are in the district.

SAINT BARTHOLOMEW'S DAY, MASSACRE OF, the massacre of Huguenots which began in Paris on St. Bartholomew's Day, Aug. 24, 1572. It was ordered by King Charles IX at the instigation of his mother, Catherine (*q.v.*) de Médicis. Various theories have been suggested as to how the idea of the massacre originated. Some Protestants at the time believed that Catherine had planned the crime during her meeting with the duque de Alba (*q.v.*) at Bayonne in 1565, notwithstanding the conciliatory policy toward the Huguenots which she pursued during the seven years that followed. A more likely theory is that Catherine grew jealous of the influence the Huguenot leader, Admiral de Coligny (*q.v.*), was exercising over Charles IX from 1571, and that she feared the possible consequences of his policy of French military intervention against Spain in the Low Countries. She accordingly gave her approval to a plot which the Catholic House of Guise (*q.v.*) had been hatching to assassinate Coligny, whom it held responsible for the murder of François de Guise in 1563.

On Aug. 18, 1572, Catherine's daughter, Margaret of France (Marguerite de Valois), was married to the Huguenot Henry of Navarre (the future Henry IV of France), and a large part of the Huguenot nobility came to Paris for the wedding. But the attempt on the admiral's life (Aug. 22) misfired: he was only wounded. The government thus had to placate the angry Huguenots by setting up a commission of inquiry. It seems that it was only when Catherine realized that the admiral would survive and that her part in the conspiracy might come to light that she decided to have all the Huguenot leaders exterminated. She planned the massacre at a meeting in the Tuileries Palace, attended by the duc d'Anjou (later Henry III of France), the marshal de Tavannes (Gaspard de Saulx), the duc de Nevers (Ludovico Gonzaga), the baron de Retz (Albert de Gondi, later duc de Retz), and the keeper of the seals, René de Birague. Charles IX was persuaded to approve of the scheme, and in the night of Aug. 23 members of the Paris municipality were called to the Louvre and given their orders.

Shortly before dawn on Aug. 24 the bell of Saint-Germain-l'Auxerrois began to toll and the massacre began. One of the first victims was Coligny, who was killed under the supervision of Henry de Guise himself. Even within the Louvre, Navarre's attendants were slaughtered, though Navarre himself and the prince de Condé (Henry I de Bourbon) were taken into protective custody. The homes and shops of Huguenots were pillaged, and their occupants brutally murdered, many of their bodies being thrown into the Seine. On Aug. 25 the government ordered the killings to stop, but the bloodthirsty mob would not listen.

As order was gradually restored, the crown had to explain the massacre: after blaming the Guises, Charles IX assumed responsibility for the deed himself, claiming that it had been necessitated by the discovery of a Huguenot plot to exterminate the royal family and seize power. The papacy was jubilant and had a medal struck to celebrate the event. Spain, too, welcomed the news. Protestant countries were horrified, and only the efforts of Catherine's ambassadors prevented the collapse of her policy of remaining on good terms with them.

Meanwhile the massacre spread to the provinces of France in a sporadic and haphazard way, continuing till the first week of October. Some towns, notably Rouen, Lyons, Bourges, Orléans, Bordeaux, and Toulouse, were scenes of carnage. Often the Huguenots were killed in cold blood in prisons where they had been detained for their own safety. Elsewhere, notably in Brittany, Normandy apart from Rouen, Picardy, Dauphiné, Provence, and most of Languedoc, the local governors ensured the peace.

No precise assessment can be given of the number of victims for the whole of France. Estimates vary considerably: the Huguenot duc de Sully, a contemporary, put the number as high as 70,000, but the 18th-century Catholic apologist Jean Novi de Caveirac calculated that only 2,000 were killed. The effect of the massacre disappointed Catherine's hopes: henceforth the Huguenots abandoned Calvin's principle of obedience to the civil magistrate, that is, to the royal authority, and adopted the view that rebellion and tyrannicide were justifiable under certain circumstances.

See also references under "Saint Bartholomew's Day, Massacre of" in the Index.

See S. L. England, *The Massacre of Saint Bartholomew* (1938); P. Erlanger, *St. Bartholomew's Night,* Eng. trans. (1962). (R. J. K.)

SAINT-BENOÎT-SUR-LOIRE, a village of northern central France, in the *département* of Loiret, on the right bank of the Loire 25 mi. (40 km.) ESE of Orléans by road. Pop. (1962) 553. The splendid 11th-century Romanesque basilica is the only survival of the Benedictine abbey of Fleury, founded *c.* 651. The abbey acquired renown when the relics of St. Benedict were brought there from Monte Cassino in Italy in 672, and Fleury then became known by its present name. The basilica is entered through a two-storied narthex surmounted by a square belfry, with pillars crowned by Romanesque, Corinthian, and symbolically carved capitals. The choir, with a double colonnade in the manner of Roman basilicas, contains the tomb of Philip I (d. 1108). The carved northern portal (early 13th century) has a lintel representing the translation of St. Benedict's relics from Monte Cassino to Fleury. The relics are contained within the massive axial pillar of the crypt (1067), below the choir.

In ancient times Fleury was a centre of druidism. The abbey, famous in the Middle Ages for its school and manuscripts, was pillaged by the Huguenots in 1562. It was restored by Richelieu, but was destroyed in 1760–1800. In 1944 the construction of a new monastery was begun by Benedictine monks from La Pierre-qui-Vire.

SAINT BERNARD PASSES, two passes across the Pennine Alps, both followed by motor roads. The Great St. Bernard (8,100 ft. [2,469 m.]), one of the highest of the frontier passes, leads (53 mi.) from Martigny (Roman Octodurus) in the Rhône valley (Switzerland) to Aosta (Roman Augusta Praetoria) in Italy. It was used in Roman times. The hospice on the pass was founded (or refounded) by St. Bernard of Menthon (d. *c.* 1081), and since the 12th or early 13th century has been in charge of a community of Augustinian (Austin) canons, the mother house being at Martigny. In former days the servants of the canons and the famous St. Bernard dogs saved many lives, especially of Italian

SAINT BERNARD PASSES, THE ALPS

workmen, but rescue by helicopter has largely reduced their work. In May 1800 Napoleon led his army over the pass, which was then traversed only by a bridle road. The Little St. Bernard (7,178 ft. [2,188 m.]) was also known in Roman times; the hospice was refounded by St. Bernard, though later it was in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 mi.) from Bourg-Saint-Maurice in the Isère valley (Savoie) to Aosta.

There is no certain mention of the road over the pass of the Great St. Bernard (Alpis Poenina, Poeninus Mons) before 57 B.C., when Julius Caesar sent Servius Galba over it. Even in Strabo's time it was impassable for wheeled traffic. Augusta Praetoria originally had but two gates, one opening toward the Little St. Bernard (Alpis Graia), the other toward Eporedia (Ivrea), but none toward the Alpis Poenina. The military arrangement of the province of Germania rendered the construction of the road necessary, and it is mentioned as existing in A.D. 69. Remains of it, about 12 ft. in width, still exist cut in the rock near the lake at the summit of the pass. The temple of Jupiter Poeninus (Penninus) is found at the summit. As a modern route the pass, open for only about five months of the year, has been partly superseded for motor traffic by the Great St. Bernard highway tunnel (first used in 1964), which is open all the year. The tunnel (5,880 m. or 3.6 mi. long) runs from Cantine de Proz to Saint-Rhémy.

The Little St. Bernard was known to the Romans as Alpis Graia. Its name, interpreted to mean "Greek" pass, was associated with the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend better suits the route through the Maritime Alps. According to some scholars Hannibal passed this way over the Alps, but the route via the Durance valley and the Col de la Traversette or via the Mont Cenis are more favoured. Alpis Graia was the principal pass over the Alps into Gallia Comata until the pass of the Alpis Cottia (Mont Genèvre) was opened by Pompeius (Pompey) in 77 B.C., and became the principal route, though the road was completed only under Augustus by Cottius in 3 B.C.

See W. W. Hyde, *Roman Alpine Routes* (1935); H. Merrick, *The Great Motor Highways of the Alps* (1958). (A. F. A. M.)

SAINT BONIFACE, a city in Manitoba, Can., situated at the confluence of the Seine and Red rivers opposite Winnipeg, and part of the Winnipeg metropolitan area. Pop. (1961) 37,600.

The city was founded in 1818 by French missionaries upon the site of an earlier, unsuccessful settlement by Swiss mercenaries, who gave the place its present name in honour of the patron saint of Germany.

As a Roman Catholic religious centre it attracted French-speaking colonists from the east as well as local métis (Indian mixed bloods). It was incorporated as a town in 1883 and as a city in 1908. Railways and roads converged there to bridge the Red River for Winnipeg, creating conditions favourable to industrial development. There are meat-packing plants, flour mills, paint and soap works, and oil refineries. Large numbers of livestock move daily into its famous stockyards.

St. Boniface is the centre of French-Canadian culture in the west; it has a French-language radio station and a French-language college affiliated with the University of Manitoba. Principal among its buildings are the Roman Catholic basilica and large hospitals overlooking the Red River. The basilica is the oldest church in western Canada. Besides the French-speaking community, there are large British, Ukrainian, German, and Polish groups. The city suffered severely from a disastrous flood in 1950. (W. H. Pr.)

SAINT-BRIEUC, chief town of the *département* of Côtes-du-Nord, northwestern France, and the seat of a bishopric, lies on the right bank of the Gouët River about 2 mi. (3 km.) from its mouth in the English Channel and 62 mi. (100 km.) NW of Rennes by road. Pop. (1962) 42,211. Extending across a promontory formed by the junction of the ravines of the Gouët and its tributary, the Gouëdic, which are spanned by viaducts, Saint-Brieuc is a busy centre of administration, commerce, and tourism. Chief among its few remaining buildings of historic interest is the 13th-century fortress-cathedral of Saint-Étienne. The town has pleasant parks and gardens; points of vantage on the boulevards bordering the ravines overlook its commercial and fishing port, Le Légué, in the Gouët estuary, the ruined 14th-century tower of Cesson dominating the estuary mouth, and the Bay of Saint-Brieuc. The *hôtel-de-ville* houses a museum and art gallery. A railway junction on the main Paris-Brest line, Saint-Brieuc also has an airport, with services to Jersey in the Channel Islands.

Saint-Brieuc is named after a Welsh monk who established an oratory there in the 5th century. In 1375 the town was defended against the duke of Brittany by Olivier de Clisson, who in 1394 attacked it himself, the cathedral suffering greatly in both sieges. In 1592 it was pillaged by the Spaniards and in 1601 ravaged by the plague. During 1602–1768 the states of Brittany met several times at Saint-Brieuc.

SAINT CATHARINES, seat of Lincoln County, Ont., Can., on the old Welland Ship Canal 2 mi. S of Lake Ontario. The first settlement was about 1790 and by 1797 part of the present site was known as Shipman's Corner. St. Catharines became a town in 1845 and a city in 1876. Known as the garden city, St. Catharines adjoins the towns of Thorold and Merritton in a continuously built-up area extending along the old canal where it climbs the Niagara escarpment. In the late 19th century St. Catharines was famed for its mineral springs but in modern times it became a manufacturing centre and the warehousing and distribution centre for the Niagara fruit belt in which it is located. Its larger industries produce automobile parts, heavy electrical apparatus, structural engineering goods and service, light and heavy hardware, and hosiery.

Pop. (1961) 84,472. (G. Fn.)

SAINT CHARLES, a suburb of St. Louis, Mo. *See* Saint Louis (Mo.).

SAINT CHRISTOPHER: *see* Saint Kitts-Nevis.

SAINT CLAIR, LAKE, is an expansive shallow basin in the St. Clair–Detroit River waterway which connects Lakes Huron and Erie and forms the boundary between the state of Michigan and the province of Ontario. The nearly circular lake is 26 mi. long, north to south, and 24 mi. wide, and has a surface area of 490 sq.mi. The area of its drainage basin, exclusive of lake surface (and exclusive of the upper Great Lakes) is 7,430 sq.mi. The principal irregularity of the shoreline is the large delta of the St. Clair River, with seven channels. The lake has low and marshy shores and a gently sloping bottom with a maximum natural depth of about 21 ft. Ship channel improvements provide a minimum depth of 27 ft. across the lake from the mouth of the St. Clair River south channel to the head of the Detroit River. The mean surface altitude of the lake is 575 ft.—6 ft. below the level of Lake Huron and 2½ ft. above that of Lake Erie. As in the connecting rivers, the monthly mean level of water surface has fluctuated through a range of about 3 ft. during the navigation seasons.

There are no port cities of importance on Lake St. Clair, but Detroit, Mich., and Windsor, Ont., have dock facilities on the Detroit River a few miles downstream from the lake.

For a discussion of the regional relationships of Lake St. Clair *see* Great Lakes, The. *See* also Saint Clair River; Saint Lawrence Seaway. (J. L. Hh.)

SAINT CLAIR RIVER, the outlet for Lake Huron, which in turn receives the waters from Lakes Superior and Michigan, forms part of the boundary between the state of Michigan, U.S., and the province of Ontario, Can. Flowing in a southerly direction into Lake St. Clair with a fall of about 5.8 ft. in 40 mi., the river discharges through seven mouths, the one known as the south channel being used for deep-draft vessels, while several of the other channels are used for small craft. The south channel was improved by the dredging of separate channels to provide a minimum depth of 27 ft. for St. Lawrence Seaway traffic. The river has a velocity near its upper end of more than 5 mph through the rapids section, and a velocity of about 2 mph through the channels entering Lake St. Clair.

The river level fluctuates with the levels of the lakes above and below. From the year 1910 on, the difference between the highest and lowest monthly mean levels during the navigation season

(generally from March to December) has been about 3 ft.

Near the head of the river are the cities of Port Huron, Mich., and Sarnia, Ont., both of which handle some water-borne commerce, but the great bulk of the traffic moves through the river without intermediate stop. This traffic is composed principally of iron ore, grain and limestone downbound and coal upbound.

There are several small towns and industrial plants along the shores of the river. For a discussion of the regional relationships of the St. Clair River *see* GREAT LAKES, THE. *See* also SAINT CLAIR, LAKE; SAINT LAWRENCE SEAWAY. (J. L. HH.)

SAINT CLAIR SHORES, a city of Michigan, U.S., in Macomb County, 10 mi. NE of Detroit, is located on the western shore of Lake St. Clair. First settled in the 18th century by the French, who laid out farms along the Detroit River and Lake St. Clair, it remained a farming area until after 1920. By mid-20th century it had developed as a suburban residential community. Its excellent boat harbours support its claim as the boating capital of Michigan. Many of its subdivisions along the lake provide canals from the lake terminating in boat-wells at the rear of residences. Private beaches for residents are also available. It was first incorporated as a village in 1925, as a city in 1950, and adopted a council-manager form of government in 1951. The population rapidly increased from 10,405 in 1940 to 76,657 in 1960. (P. P. M.)

SAINT-CLOUD, a town of northern France, in the *département* of Seine-et-Oise, lies on the left bank of the Seine, 7½ mi. (12 km.) W of Notre Dame, Paris, by road. Pop. (1962) 26,433. The town is named after Clodoald or Cloud (grandson of Clovis), whose tomb was discovered in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. Henry III and the king of Navarre (Henry IV) established their camp at Saint-Cloud during the league for the siege of Paris, and the former was assassinated there. The castle, at that time a plain country house belonging to Pierre de Gondi, archbishop of Paris, was acquired in 1658 by the duke of Orléans, who built a palace which was destroyed in 1870. It was at Saint-Cloud that Napoleon carried out the *coup d'état* of 18 Brumaire (1799); after he became emperor the palace was his favourite residence, and he celebrated his marriage there to Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris. Seized by the Prussians at the beginning of the investment of Paris in 1870, Saint-Cloud was sacked during the siege. In World War II it was in German hands from June 14, 1940, to Aug. 24, 1944. Built on a hillslope overlooking the river, the Bois de Boulogne, and Paris, the town is one of the favourite resorts of Parisians. Every September, at the time of the pilgrimage of St. Cloud, a fair is held in its beautiful park. Within the area of the park is the national Sèvres porcelain factory.

SAINT CLOUD, a city and seat of Stearns County in the central part of Minnesota, U.S., is located at the junction of the Mississippi and Sauk rivers, 65 mi. NW of Minneapolis. The fertile surrounding country produces dairy products and grain in particular. Extensive ledges of high quality granite have given St. Cloud the nickname of the "granite city," and its chief industries are granite quarrying and granite products. It also has smaller printing and metal industries and extensive railroad shops are maintained there.

It is the seat of St. Cloud State College (established 1869), and of the state reformatory (1887), a U.S. veterans hospital (with 350 ac. of ground), a Roman Catholic cathedral, and several schools and charitable institutions under religious auspices. Nearby are located two Roman Catholic colleges—St. John's University (1857) at Collegeville, for men; and the College of St. Benedict (1913) at St. Joseph, for women. The population is predominantly of German descent, and Roman Catholicism is the main religion of the community.

St. Cloud was settled in 1851, platted in 1854, by John L. Wilson of Maine and named for the French city, incorporated as a village in 1868, and chartered as a city in 1889. Since 1912 it has had a commission form of government. Before the coming of the railroad it was the terminus of the Hudson's Bay Company for unloading furs brought down from the Red River Valley in wooden oxcarts. During the Sioux uprising of 1862 in the Minnesota River Valley, the men of St. Cloud hastily erected fortifications, and the settlement served as a refuge for thousands of homesteaders who fled from the Sioux attack.

For comparative population figures *see* table in MINNESOTA: *Population.* (R. W. F.)

SAINT CROIX (SANTA CRUZ), the largest (80 sq.mi.) of the Virgin Islands (*q.v.*), purchased by the United States from Denmark in 1917. The island was discovered Nov. 14, 1493, by Columbus who called it Santa Cruz, a name still sometimes used. After the fierce aboriginal Carib Indians were exterminated, it was occupied and partly settled in turn by small numbers of Spanish, Dutch, English and French. It was held by the Knights of Malta (1651–65). The island was virtually deserted (1695–1733) when the Danish West India and Guinea company purchased it. By 1742 there were 1,900 slaves.

Denmark acquired the island in 1754 and, after an insurrection of the slaves, emancipated them in 1848. About 90% of the 14,973 inhabitants (1960) are of Negro and Negro-white descent. The literacy rate is high.

The island is served by a network of asphalt roads. There is air service to all parts of the Caribbean from the Alexander Hamilton airport. Frederiksted is a west coast port and Christiansted, the chief town (sometimes called Bassin), is located on the northeast coast. Hills rise abruptly from the northern shore (highest point Mt. Eagle 1,165 ft.) and give way to fertile rolling lands, lagoons and beaches to the south. The climate is healthful with a mean annual temperature of 74° F. and an average rainfall of 45.7 in.

The tourist trade, rum, sugar cane and cattle raising constitute the island's basic economy. Despite appropriations by the United States, housing, potable water, sewage, road construction and maintenance and a higher standard of living remain continuing problems. After the fall of Batista in Cuba, Jan. 1, 1959, and the subsequent unrest under Castro the number of tourists increased. (R. W. LN.)

SAINT CROIX RIVER, 129 mi. long, forms the international boundary between Maine in the U.S. and New Brunswick in Canada. It arises as the outlet of the Chiputneticook lakes, which are also the boundary, and discharges into Passamaquoddy bay. From the mouth upstream for approximately 10 mi. it is a tidal estuary, navigable to Calais, Me., where power dams block the channel.

SAINT CROIX RIVER of Wisconsin flows 164 mi. southwestward across the state emptying into the Mississippi at Prescott, Wis., about 20 mi. south of St. Paul. For 130 mi. upstream from its mouth it forms the boundary between Wisconsin and Minnesota. (C. M. DA.)

SAINT CYR-L'ÉCOLE: *see* MILITARY, NAVAL, AND AIR ACADEMIES: *France.*

SAINT DAVID'S (TYDDEWI), cathedral village of Pembrokeshire, Wales, situated near the sea, southeast of St. David's head, the most westerly promontory of south Wales. Pop. (1961) 1,690. St. David's is 16 mi. N.W. of Haverfordwest and 16 mi. S.W. of Fishguard by road. The little town, locally known as "the city," stands in a lofty position near the cathedral close, and consists of four streets focusing on the square, called Cross square, the ancient market place still possessing its market cross (restored 1873). The origin of the fine cathedral and its village "city" in an area so remote under modern conditions is of special interest. Northwestern Pembrokeshire, like most western promontories of Britain, France and Spain, is remarkably rich in old stone monuments (menhirs, dolmens and stone circles), a fact pointing in all probability to its being on the coastwise and transpeninsular route frequented by prehistoric traders from the Mediterranean to Ireland. (*See* PEMBROKESHIRE.) The little boats of old were driven hither and thither at the mercy of wind and tide, and so the coast in these parts became dotted with alternate landing places, *e.g.*, Porth y Rhaw, St. Non's Bay, Porth Clais, Porth Stinian, Whitesand Bay, which seem to have made the neighbourhood important in pre-Christian times, as one may judge from folk tradition, monuments on the headland, etc.

The pre-Christian tradition was continued by the Celtic saints moving between Ireland and Wales. In early medieval days the same route grew important, as pilgrims moved to and from the shrine of Santiago de Compostela in northwestern Spain. (*See* Hartwell Jones, "Celtic Britain and the Pilgrim Movement," *Y Cymmrodor*, 1912.) The little landing places on the shore had Christian chapels, where prayers were possibly said for safe voyages. The most important ruins at present are those of St. Justinian and St. Non. At a focal point behind a group of these small ports, in the quiet sheltered, well-watered valley of the Alun, the fine cathedral (from Norman times with the double dedication to St. David and St. Andrew) was built, and on the high plateau around, as if sheltering it still further, the "village-city" grew. Throughout the middle ages the cathedral was the centre of pilgrimage and the medieval roads (often marked by sacred wells) may be traced across Pembrokeshire focusing on St. David's. Two pilgrimages to St. David's were popularly thought to equal one to Rome, and three pilgrimages to St. David's one to Jerusalem. The early holders of the see ventured, while the central government was weak, to exercise metropolitan rights over much of south Wales, but the increasing power of the Norman penetration reached St. David's, and Anselm's forcible appointment of Bernard—a Norman monk—to be bishop in 1115 made St. David's a suffragan see of Canterbury. A conciliatory step, it would appear, was the canonization of David about 1120. Gerald de Barri (Giraldus Cambrensis) strove vainly to regain the ancient power of St. David's from 1199–1203.

The Cathedral.—The cathedral church is partly built of a beautiful purple-hued sandstone, quarried locally. Its central tower, rebuilt after the original had fallen in 1220, was restored by Sir George Gilbert Scott who also designed the west front and did an extensive restoration of the cathedral. The earliest and main portion of the existing fabric, the fourth on the site, was erected under Bishop Peter de Leia (1176–98) in the transitional Norman-English style. Bishop David Martin (1296–1328) built the Lady chapel; Bishop Henry de Gower (1328–47) made many additions in the Decorated style, including the stone rood screen and southern porch; and Bishop Edward Vaughan (1509–22) roofed over the space between the choir and Lady chapel now known as the Trinity chapel. The cathedral suffered severely during the changes brought about by the Reformation and at the hands of Bishop William Barlow (1536–48) and again during the civil wars of the 17th century. Subsequent restorations took place. The interior of the nave, separated by six wide bays from the aisles, is imposing with its triforium and clerestory. It has an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (*c.* 1500). The nave is divided from the choir by Bishop Gower's fine stone screen, while the choir contains the richly carved stalls erected by Bishop Tully (1460–81), the episcopal throne and an oaken screen separating choir and presbytery. Bishop Vaughan's chapel contains fine Tudor fan-vaulting, and the Lady chapel decorated sedilia.

To the north of the cathedral is the ruined shell of the beautiful chapel, with an adjoining tower, that formed part of the college of St. Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377. On the west bank of the Alun stand the ruins of the episcopal palace erected by Bishop Gower (*c.* 1342). The palace was built for residential purposes rather than for defense and occupies three sides of a quadrangle 120 ft. square, and, though roofless and deserted for nearly three centuries, retains most of its principal features. The great hall possesses a traceried wheel window, the chief portal is still imposing, and the chapel retains its curious bell turret, while the peculiar but graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (*c.* 1540), the palace was occasionally occupied by succeeding bishops prior to the civil wars. The close contains the deanery and other residences of the cathedral clergy, mostly on the sites of ancient buildings. It was formerly surrounded by a wall, traces of which survive; there were four gateways but the Tower gate alone remains.

SAINT DENIS, RUTH (Ruth Dennis) (1877–), whose active dance career spanned half a century, was one of the most important pioneers of 20th-century American dance. Her personal influence was enormous, and through the pupils she shared with her husband, Ted Shawn (*q.v.*), it extended into almost every phase of the dance art in the United States.

Born in Newark, N.J., Ruth St. Denis was a comparatively successful vaudeville and musical-comedy dancer and also an actress before she became a serious dance artist and innovator. A cigarette poster accidentally seen in 1904, while she was touring in David Belasco's production of *Du Barry*, turned her attention to Egypt and the Orient. Careful study of Hindu philosophy and art led to the production of her ballet, *Radha*, in 1906. Its success brought her a triumphant three-year tour of Europe.

Returning to the United States, she produced *Egypta* and a Japanese dance drama, *O-Mika*. In 1914 she met and married the young dancer Ted Shawn, who shared her serious, idealistic approach to the dance. Together they founded the Denishawn School, which fostered many figures of importance in American dance, including Martha Graham, Doris Humphrey, and Charles Weidman.

The Denishawn Company toured widely in the United States, and visited the Orient in 1925–26. Never divorced, she and her husband separated in 1931. After brief semiretirement, she soon resumed performing her famous solos. Deeply concerned with the spiritual aspects of her art, Miss St. Denis devoted herself intensively to the furtherance of dance in religion.

See her autobiography, *Unfinished Life* (1939); Walter Terry, "Ruth St. Denis," ch. 6 in *The Dance in America* (1956). (Ln. Me.)

SAINT-DENIS, capital town of the French overseas *département* of Réunion in the Indian Ocean, lies in a basin at the mouth of the St. Denis River on the north coast of the island. Pop. (1962) 37,047, including most of the metropolitan French in Réunion. The town is built to a grid plan, with a suburb occupied by the *élite* on the southern bluff, Le Brûlé. There are some notable colonial buildings. Saint-Denis is connected with the other main centres of population by a railway along the island's northern and western coast. Commerce is largely in the hands of an Arab minority. (Ha. C. Bd.)

SAINT-DENIS, an industrial suburb of Paris on the Seine River in the *département* of Seine-Saint-Denis, formerly in the *département* of Seine. It is 6 mi. (9½ km.) N of Notre-Dame. Pop. (1962) 93,783. The town is centred on the abbey church of Saint-Denis and associated monastic buildings; the latter, designed by Robert de Cotte in the 18th century, were transformed by Napoleon I into a school for the daughters of members of the Legion of Honour. Opposite is the municipal Museum of History and Art, founded in 1902 to house Merovingian, Romanesque, and Gothic remains excavated nearby. It has also a collection of documents relating to the abbey and its history, works of the Impressionist painters, and a reconstruction of the study of the poet Paul Éluard (*q.v.*), a native of Saint-Denis. The abbey was founded in the 7th century by Dagobert I. The foundations of the 7th-century abbey church were uncovered in 1957.

A reconstructed church, of traditional Roman basilical plan, was dedicated by Charlemagne in 775, and traces of it are to be found in the narthex of the present church, begun under Abbot Suger (*q.v.*) about 1135. Suger's church was to transform western architecture; it marks the transition from Romanesque to Gothic. This is best seen in the chancel, and the ambulatory with its great stained-glass windows. In the chapels radiating from the ambulatory are altar screens of the 12th and 13th centuries and a Romanesque altar front with sculptures of the Apostles. The west facade (1137–40) is uneven and was much restored with other parts of the church during the 19th century by E. E. Viollet-le-Duc (*q.v.*), who also built Saint-Denis de l'Estrée in Gothic style. The choir, apse, and nave were rebuilt under Louis IX. The church was the burial place of the French kings and their families; the most remarkable tombs are those that date from the 16th century, including that of Louis XII and Anne of Brittany; that of Francis I and Claude of France, made under the direction of Philibert Delorme; that of Henry II and Catherine de Médicis, the masterpiece of Germain Pilon; that of the dukes of Orléans and of the poet Charles d'Orléans. There is also a curious medieval work, the tomb of Dagobert I. The crypt dates partly from the 10th and 11th cen-

turies, and contains some interesting Romanesque capitals, but it has been heavily restored. Formerly, the coffin of the dead king lay there until, on the death of his successor, it was removed to its tomb in the nave. The remains of Louis XVI, Marie Antoinette, and Louis XVIII were walled off from public view in 1957.

Known in Roman times as Catulliacum, Saint-Denis was of little importance until the foundation of its abbey, built over the tomb of St. Denis. In the 12th century, Abbot Suger developed the Foire du Lendit, which has now been revived and is held in June. Under Suger the town became a great artistic and intellectual centre. From the 12th to the 15th centuries, French kings carried the oriflamme (banner) of Saint-Denis into battle. The *Grandes Chroniques de France* were produced in the abbey, and Peter Abelard (*q.v.*) was a monk there for a time. The town suffered in the Hundred Years' War, and in 1567 was the scene of a battle between Huguenots and Catholics. During the Revolution many of the tombs of the French kings were destroyed, and part of the treasure melted down.

Saint-Denis is on the main railway north from Paris, and is a point of convergence of main roads from the north. It is also linked to Paris by *métro* and bus, and lies near Le Bourget airport. The Canal Saint-Denis crosses the town from northwest to southeast and leads to the Canal de l'Ourcq in Paris. A modern residential area extends to the north and northeast of the town and industrial quarters to the south. Saint-Denis has important industries manufacturing diesel engines, tractors, printing machines, chemicals, plastics, glues, inks, penicillin, leather (an industry with its roots in the Middle Ages), fireworks, and printed materials.

See E. Panofsky (ed.), *Abbot Suger on the Abbey Church of St-Denis and Its Art Treasures* (1946); S. McK. Crosby, *L'abbaye royale de Saint-Denis* (1953). (OL. F.)

SAINTE ANNE DE BEAUPRÉ, a village of Montmorency County, Quebec, Can., is about 20 mi. NE of Quebec City at the junction of the Ste. Anne and St. Lawrence rivers. Laid out along the St. Lawrence, the village is located on a narrow agricultural plain with hills in the background. Pop. (1961) 1,382. The shrine of Ste. Anne de Beaupré is a notable Roman Catholic place of pilgrimage where numerous miraculous cures have been recorded. Settled about 1650, the first chapel was built in 1658, according to tradition, by French sailors who, having been shipwrecked in the St. Lawrence, promised, if saved, to build a small chapel where they would reach land.

The first reported miracle, the curing of a local resident's rheumatism, occurred that same year. The Huron Indians, in 1670, were the first pilgrims to visit the chapel. In the 20th century the shrine was visited by pilgrims from all over Canada and the United States. The basilica of Ste. Anne de Beaupré, of 12th-century Roman Gothic style, is 375 ft. long, 200 ft. wide, and 100 ft. high. It has five naves, 10 small chapels, and can accommodate approximately 9,000 worshipers. Begun in 1923, it had not been finished by the 1960s.

Sainte Anne de Beaupré is the headquarters of the French Canadian Redemptorists and the seat of their college. An attraction of the village is a huge cyclorama depicting the day of the Crucifixion. (P. CA.)

SAINTE-BEUVE, CHARLES AUGUSTIN (1804–1869), French author and literary critic, regarded as the "father of modern French criticism," was born at Boulogne on Dec. 23, 1804. His father died two months before he was born, and his mother, daughter of an Englishwoman and of a Boulogne sea captain, was 40. The milieu in which he spent his childhood profoundly affected him; his mother and his father's sister, both of slender means, brought him up, and from them he derived those qualities of shrewdness, prudence, moderation, and lucidity found in his work. A studious and meditative child, he had no distractions except the reading of Latin authors and the French classics.

At 13 he had finished his studies at Boulogne and wished to complete them at Paris, where he hoped to learn Greek. In 1818 he became a boarder at the Pension Landry in Paris and followed courses first at the Collège Charlemagne, then at the Collège Bourbon. His masters allowed him to take the evening courses in science and philosophy at the Athénée, where he heard the "Idéologues" Destutt de Tracy and Georges Cabanis, whose theories of psychology and physiology influenced his development. He then turned to medicine, which he studied at the École de Médecine from 1823 to 1827. Nobody ever thought that the young man could earn a living by writing; but when his former master of rhetoric, Paul Dubois, founded the literary review *Le Globe* in 1824, Sainte-Beuve was eager to join in the new adventure and started contributing his first articles.

His review of Hugo's *Odes et ballades,* published early in 1827, marked the beginning of his friendship with Hugo and his sympathetic articles on the Romantic poets. By this time Sainte-Beuve devoted himself entirely to literature, having given up his medical pursuits. His allegiance to the Romantic movement is reflected in his first big study, *Tableau historique et critique de la Poésie française du XVI^e siècle* (1828), which equates, for example, the great Ronsard with Hugo and compares the Pléiade and the Cénacle. After a visit to England in 1828, he published a series of literary portraits (of Boileau, Corneille, etc.) in the new *Revue de Paris* (1829). At the same time he was working on two volumes of poetry: *Vie, Poésies et pensées de Joseph Delorme* (1829; published anonymously) and *Consolations* (1830). From 1831 onward, he contributed to another new periodical, the *Revue des deux Mondes.* The success of his articles in the two reviews prompted him to collect them as *Critiques et Portraits littéraires* (1832; volumes ii, iii, 1836; volumes iv, v, 1839).

The friendship with Hugo, which had already begun to cool in 1830, was almost extinguished by the anonymous publication of Sainte-Beuve's autobiographical novel, *Volupté* (July 1834). The hero Amaury's hopeless love, which ends only with the death of the saintly and unapproachable Mme de Couaën, reflects the author's passion for Mme Hugo. This same passion is given poetic expression in the secret *Livre d'Amour* (written 1831–32; published 1843) and, to a lesser extent, in the *Pensées d'août* (1837), which mark the end of Sainte-Beuve's career as a poet.

In October 1837 he left Paris for Switzerland, where a Swiss friend had arranged for him to lecture on Port Royal at the University of Lausanne. The 81 lectures (November 1837 to May 1838) covered the religious and literary history of half the 17th century. When *Port-Royal* appeared in three volumes (1840–48), it was a masterly piece of scholarship, and it remains an important historical document of the period.

Sainte-Beuve, by now an established scholar and critic, presented himself unsuccessfully for election to the Académie Française in 1843. He was elected in 1844 and received in February 1845. In August 1840 Victor Cousin, then minister of public instruction, had appointed him as a *conservateur* at the Bibliothèque Mazarine, with an annual salary of Fr. 4,000 and a lodging at the *Institut.* This gave him leisure to perfect his Greek. He published articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager in the *Journal des débats* and the *Revue des deux Mondes;* these and others were collected in the series *Portraits littéraires* (1844), *Portraits de Femmes* (1844), and *Portraits contemporains* (1846). These portraits are typical of his method of re-creative criticism. He pursued his researches on Jansenism and on Pascal, to complete the third volume of *Port-Royal;* the Revolution of 1848 delayed publication until September. When, in March 1848, he was wrongly accused of having taken from the secret funds the sum of Fr. 100 (an expense incurred probably by a repair to his chimney), he resigned his position. He asked for a post in Belgium and was appointed to the University of Liège. There he gave 21 lectures (October 1848 to June 1849) on *Chateaubriand et son groupe littéraire* (published 1860).

Soon after his return to Paris in the summer of 1849, he was asked by Louis Véron, editor of the newspaper *Le Constitutionnel,* to write a weekly article, to appear every Monday, on current literary topics. This was the start of his famous *Lundis,* the critical and biographical essays which appeared in *Le Constitutionnel* (October 1849 to November 1852; September 1861 to January 1867), *Le Moniteur* (December 1852 to August 1861; September 1867 to November 1868), and *Le Temps* (1869). The success of his articles was such that he began collecting them as *Causeries du Lundi,* 3 volumes (1851); the third edition, augmented by

notes, formed altogether 15 volumes (1857–62). A new series, the articles of 1861–69, was published as *Nouveaux Lundis,* 13 volumes (1863–70).

On his mother's death in 1850, Sainte-Beuve established himself at 11 rue de Montparnasse. In 1854 he was appointed to teach Latin poetry at the Collège de France. He gave his first lecture on March 9, 1855; but, because of interruptions and hostile manifestations by his former liberal friends, whom he had alienated by his support of Louis Napoleon (Napoleon III) and the Second Empire, he resigned after the second lecture (March 14). The intended course of lectures was published as *Étude sur Virgile* (1857). As a result of a general reform of the École Normale, he was chosen for the chair of French literature in October 1857. He lectured there twice a week from April 1858 to July 1861. Sainte-Beuve did not publish any collected volumes of these lectures, but his edited notes, transcripts, exordiums, and conclusions form seven folio volumes of the Collection Lovenjoul.

On April 28, 1865, he was made a senator by imperial decree. His addresses to the Senate were unpopular with his colleagues because of his liberal views, but two were epoch making: that on public libraries and liberty of thought (June 25, 1867), and that on liberty of education (May 19, 1868). Meanwhile he had written four outstanding articles on *Proudhon étudié dans ses correspondances intimes* for the *Revue Contemporaine* (October–December 1865). In December 1868 *Le Moniteur,* which had been independent, was reorganized and became *Le Journal officiel de l'Empire français.* An article (*"Sur la poésie," de Paul Albert*) which Sainte-Beuve wished to publish caused difficulties; for the first time he was asked to correct and to cut a sentence. He withdrew the article and offered it to *Le Temps,* for which he remained a contributor until his death, on Oct. 13, 1869, in Paris. He was buried at the cemetery of Montparnasse.

Assessment.—It was with Sainte-Beuve that French criticism first became fully independent and freed itself from prejudice and partisan passions. That he was able to revolutionize critical methods was partly a result of the rise of the newspaper and the critical review, which gave prestige and wide circulation to criticism and guaranteed its independence. When Sainte-Beuve began to write, the French attitude to the great literary heritage of the past, studded with illustrious names, was one of undiscriminating admiration and respect.

His critical works, published over a period of about 45 years, constitute a unique collection of literary portraits. He ranged widely, covering every genre of literature and reinstating writers whose works had been forgotten or misunderstood. An enemy of all kinds of bias, he wished above all to see clearly; by his definition, a critic was one who knew how to read and who could teach others how to read. His delicate discrimination, itself a proof of sincerity, is equaled only by his love of the truth. All his life he was faithful to the words he wrote to Victor Duruy (Dec. 9, 1865): "Si j'avais une devise ce serait le vrai, le vrai seul" ("If I had a motto, it would be 'Truth, truth alone' ")—words inscribed on the pedestal of his bust in the Jardin du Luxembourg, Paris.

To use his own phrase, Sainte-Beuve was primarily a creator of likenesses (*imagier des grands hommes*). Every one of the articles he wrote was based on wide reading and extensive research. He devoted at least four days to preparing his Monday articles and to verifying references; he corrected the proofs himself with great care. He wished, as he said, to understand fully those about whom he wrote, not to be hasty in judgment, but to live alongside them, to allow them to explain themselves, to develop day by day, and to portray themselves to us. He sought to re-create the past, not as it was, but as it is for us today. His conception of criticism was that of a moralist, but, preferring insight to regimentation, his chosen instrument was an eyeglass (*lorgnon*) not a cane (*férule*). He was able to achieve his enormous output, which constitutes an encyclopaedia of thought, only by relentless labour and an unequaled tenacity of purpose, linked with unusually subtle intellectual power. The supplementary footnotes added to each successive edition of his works show his scrupulous and continuous attention to detail. This scholarly concern is seen already in 1836, when he wrote, "the devil of exactitude and of literary detail is as tormenting as any other kind of devil. . . . I would go to the end of the world for a minute detail, like a mad geologist after a pebble."

The field of criticism has widened since the time of Sainte-Beuve, and as a result he has come to be reproached for his omissions and injustices. As one who prepared the way for modern poetry, he is disappointing when writing on Baudelaire; he was unfair, it is said, to Flaubert, Stendhal, and especially to Balzac. But this is only partially true. His article on Balzac in vol. ii of the *Causeries* is, despite the few reservations made in it, sound in judgment. As for Stendhal, who, except Balzac, did justice to him while he was still alive? The publication of Marcel Proust's *Contre Sainte-Beuve* in 1954 revived some of the earlier objections but in itself contributed little. That Sainte-Beuve has gained a place in the "Bibliothèque de la Pléiade" (see *Bibliography*) is, perhaps, sufficient proof that he is still read and reread.

As a poet, Sainte-Beuve was admired by Baudelaire and Verlaine; as a novelist, he remains an important innovator (Amaury and Mme de Couaën were to have descendants in later novels throughout the 19th century). But as a critic, he is unrivaled. A fitting summary of his life and work was given by Barbey d'Aurevilly in his words, "Sainte-Beuve, abeille des livres . . . faisant miel de tout pour le compte de la littérature" ("Sainte-Beuve, like a bee among books . . . distilling honey from everything of literary value").

BIBLIOGRAPHY.—There is no edition of Sainte-Beuve's complete works, but good selective editions are M. Wilmotte, *La Littérature française des origines à 1870,* 10 vol. (1926); M. Allem, *Les Grands Écrivains français par Sainte-Beuve,* 23 vol. (1926–32); and M. Leroy, *Sainte-Beuve,* "Bibliothèque de la Pléiade," 5 vol. (1949–55). English translations include *Causeries du Lundi,* selected and ed. by G. Saintsbury (1885); *Essays by Sainte-Beuve,* trans., with an introduction, by E. Lee (1910); *Selections from Sainte-Beuve,* ed. by A. Tilley (1918); and *Sainte-Beuve: Selected Essays,* ed. by F. Steegmuller and N. Guterman (1963). *See* also J. Bonnerot, *Bibliographie de l'oeuvre de Sainte-Beuve,* 3 vol. (1937–52), *Un Demi-siècle d'études sur Sainte-Beuve, 1904–54* (1957); *Correspondance générale de Sainte-Beuve* (1935–), ed. by J. Bonnerot and from 1965, by A. Bonnerot: 15 volumes had appeared by 1965.

SAINTE-CLAIRE DEVILLE, HENRI ÉTIENNE (1818–1881), French chemist whose most important work was in inorganic and thermal chemistry, was born on March 11, 1818, on the island of St. Thomas, West Indies, where his father was French consul. In 1844, having graduated in Paris as doctor of medicine, he was appointed to organize the new faculty of science at Besançon, where he acted as dean and professor of chemistry from 1845 to 1851. He succeeded A. J. Balard at the École Normale, Paris, in 1851, and in 1853 became professor at the Sorbonne in place of J. B. A. Dumas. He died at Boulogne-sur-Seine on July 1, 1881.

He began his experimental work in 1841 with investigations of oil of turpentine and tolu balsam, in the course of which he discovered toluene. In 1849 he discovered dinitrogen pentoxide, the first of the so-called anhydrides of the monobasic acids to be isolated. In 1854 he devised a method by which aluminum (*q.v.*) could be prepared on a large scale by the aid of sodium, the manufacture of which he also developed. He contributed notably to the chemistry of magnesium and silicon (*qq.v.*), and did important work on the phenomena of reversible reactions.

SAINT ELMO'S FIRE, the glow accompanying the brushlike discharges of atmospheric electricity which usually appears as a tip of light on the extremities of pointed objects such as church towers or the masts of ships during stormy weather. It is commonly accompanied by a crackling or fizzing noise.

St. Elmo's fire, or corona discharge, is commonly observed on the periphery of propellers, along the wing tips, windshield and nose of aircraft flying in dry snow, ice crystals, or in the vicinity of thunderstorms. Various flight procedures, in addition to mechanical and electrical devices designed to reduce the charge accumu-

lation, are utilized as safeguards in preventing or minimizing discharges. (*See* also LIGHTNING: *Effects of Lightning*.)

The name St. Elmo is an Italian corruption, through *Sant' Ermo*, of St. Erasmus, the patron saint of Mediterranean sailors, who regard St. Elmo's fire as the visible sign of his guardianship. (E. J. MR.)

SAINTE-PALAYE, JEAN BAPTISTE LA CURNE DE (1697–1781), French medievalist and lexicographer, was born at Auxerre on June 6, 1697, the son of a gentleman of the household of the duc d'Orléans. Elected to the Académie des Inscriptions in 1724, he devoted himself at first to historical studies. He worked on a number of medieval chronicles for the series edited by Dom Bouquet (1738 *et seq.*) and went twice to Italy (1739 and 1749) to pursue his researches. He became director of the Académie des Inscriptions in 1754. In 1756, however, he produced an ambitious plan for a glossary of Old French. For this he was elected to the Académie Française in 1758. The first volume of the work was ready for the press in 1780, but publication was halted by Sainte-Palaye's death (in Paris on March 1, 1781) and then by the Revolution of 1789. The whole work finally appeared as *Dictionnaire historique de l'ancien langage françois, ou Glossaire de la langue françoise depuis son origine jusqu'au siècle de Louis XIV*, ten volumes, edited by L. Favre and M. Pajot (1875–82), with a life of Sainte-Palaye in volume ten.

SAINTES, a market town of western France and subprefecture in the *département* of Charente-Maritime, is situated on the left bank of the Charente River 47 mi. (76 km.) SE of La Rochelle. Pop. (1962) 23,594. The Roman town (Mediolanum) was established in the tribal area of the Santones and the town became the chief centre of the district later known as Saintonge. The most noteworthy Roman remains are the ruins of an amphitheatre of the end of 1st century A.D., and an arch that has been transferred from the Roman bridge. Saintes was the seat of a bishopric until the Revolution. Its old cathedral of St. Peter, dating from the 15th and 16th centuries, was badly damaged by the Huguenots in 1568. Remnants of an older Romanesque church are incorporated in its structure, and there is pure Romanesque work in the church of St. Eutropius, which contains the tomb of Eutropius, first bishop of Saintes. Saintes is now a typical French provincial town, the market centre for the surrounding district, which is noted for its production of cognac. It has the regional museum of Saintonge, and there are iron foundries and pottery and tile-making industries. Small craft can use the Charente, but Saintes is no longer important as a river port. (AR. E. S.)

SAINTES-MARIES-DE-LA-MER, LES, a fishing village of the Camargue (*q.v.*), southern France, in the *département* of Bouches-du-Rhône, lies on the Mediterranean coast near the Étang de Vaccarès (lagoon), 24 mi. (38 km.) SSW of Arles by road. Pop. (1962) 871. The name has its origin in the ancient Provençal tradition that Mary, sister of the Virgin, and Mary, mother of James and John, together with their black servant Sara, Lazarus, Martha, Mary Magdalen, and St. Maximin fled there to escape persecution in Judaea. Relics of the first two Marys and of Sara are preserved in the 12th-century Romanesque fortress-church, which is the object of pilgrimages twice a year, on May 24–25 and on the Saturday and Sunday following Oct. 22. A feature of the May pilgrimage is the large number of gypsies who take part to do honour to their patroness Sara. In addition to the religious ceremonies there are bullfights, cattle branding, and other attractions. Saintes-Maries has a Camargue museum, and nearby, at Pont de Gau, is a zoological park with flamingos and other birds which breed in the Camargue nature reserve.

SAINT-ÉTIENNE, an industrial town of east-central France and *préfecture* of the *département* of Loire, lies 310 mi. (499 km.) SSE of Paris and 36 mi. (58 km.) SW of Lyons.

From its old nucleus, huddled round the church from which the town takes its name, it experienced considerable industrial growth from the 16th century. The manufacture of firearms for the state dates from the time of Francis I, and the silk industry was also introduced into the area in the 16th century. Metalworking first depended upon local iron ore, smelted with charcoal. The local coal is excellent for coking and some of the earliest coke-smelting furnaces were established in the district. Although small, the local coalfield has been worked along the outcrops since the Middle Ages, and the high quality of its coal encouraged mining development early in the 19th century to serve the needs of local industries and of railways. The earliest railway in France connected Saint-Étienne with Andrézieux, 10 mi. away on the Loire, in 1828, and with Lyons in 1832.

As a major textile manufacturing centre, Saint-Étienne is especially concerned with ribbons, elastic fabrics, and mixtures of cotton and silk or rayon. There is a large dyeing industry. Coal mining has declined, and there is no longer any iron smelting at Saint-Étienne, but the manufacture of alloy steels is important, especially for armaments. The town has a huge state armaments factory, and great quantities of small arms are made by private firms as well as by independent gunsmiths in small workshops. Manufactures of hardware, cycles, aircraft engines, textile machinery, and chemicals are other leading industries.

Saint-Étienne's industrial growth from a town of 17,000 inhabitants in 1800 to 200,528 in 1962 greatly extended the built-up area, especially along the axial road from the Rhône valley to Roanne. An important focus of roads and railways, Saint-Étienne is not only the administrative centre of the *département* and of the coextensive diocese but is a regional capital and the shopping centre for the coalfield area, which includes a total population of about 300,000. (AR. E. S.)

SAINT EUSTATIUS (SINT EUSTATIUS), a Caribbean island in the Bovendewinds (Windward) group of the Netherlands Antilles, lies 9 mi. (14 km.) NW of St. Kitts. Pop. (1960) 1,014. With Saba (pop. 980) 7 mi. NW, it forms the northwestern termination of the inner volcanic arc of the Lesser Antilles. The annual rainfall of the two islands (about 42 in. [1,067 mm.] for St. Eustatius and 47 in. for Saba) exceeds that of the other Netherlands Antilles, and falls mainly between May and November, occasionally associated with hurricanes. St. Eustatius (area 12 sq.mi. [31 sq.km.]) is dominated by the Quill, an extinct volcano (1,968 ft. [600 m.]) in the south with a large forested crater. A flat central plain separates it from low hills in the north.

St. Eustatius, first colonized by the French and English in 1625, was taken by the Dutch in 1632. It became the main centre of slave trade in the eastern Caribbean and by 1780 had a prosperous population of 2,500. In 1781 the capital, Oranjestad, was sacked by the British and the island never regained its trade. In the 17th and 18th centuries most of the land was under sugar cultivation, but it is now used only for subsistence crops and rough grazing. Many men emigrate to work in the oil refineries of Curaçao and Aruba.

Saba (area 5 sq.mi. [13 sq.km.]) consists of the peak of an extinct volcano, The Mountain (2,821 ft. [860 m.]), surrounded by sea cliffs. The villages of Bottom and Windwardside are located on the only flat land and are approached up a steep road from a rocky landing place on the south coast. Saba was settled by the Dutch in 1632 but, because of its inaccessibility and ruggedness, never achieved any economic importance and often functioned as a buccaneers' stronghold. Its population, mainly white, is engaged chiefly in raising livestock and the cultivation of vegetables, particularly potatoes, which are exported to neighbouring islands. English is the principal language. (D. R. H.)

SAINT-ÉVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1614–1703), French man of letters who earned a reputation as a free thinker by his writings on religious and moral questions, which represent an important stage in the origins of the French Enlightenment. He was the first French critic to judge English comedy for its intrinsic merits rather than by the canons of French "classical" taste, and his comments on the Quarrel of the Ancients and Moderns are models of sound judgment.

Saint-Évremond was born at Saint-Denis-le-Gast in Normandy on or just before Jan. 5, 1614, and was educated in Paris by the Jesuits. Though he had a distinguished military career and reached the rank of *maréchal de camp*, his political sympathies which he expressed more than once in an uncompromisingly satirical style, made him appear a hostile and potentially dangerous critic of the

absolute system of government which Mazarin and Louis XIV were trying to establish. His accidental implication in the fall of Fouquet, in September 1661, provided a pretext for his disgrace, and he fled to England where, apart from a stay of five years (1665–70) in Holland, he spent the rest of his life. He died in London on Sept. 29, 1703, and was buried in Westminster Abbey, where he is commemorated in Poets' Corner.

Saint-Évremond devoted himself seriously to writing after his exile, in order to compensate for the failure of his ambitions as a man of action. In France, he had already had conversations with Pierre Gassendi, the French Epicurean philosopher; in England, he knew Hobbes, and in Holland, Spinoza. He was greatly stimulated by the cosmopolitan society which met in the house of Hortense Mancini, the Duchess Mazarin, who settled in London in 1675. His best works are the witty *Conversation du maréchal d'Hocquincourt avec le Père Canaye* (*c.* 1668), which is a satire on religious fideism, and the *Discours* written in 1671, in the final chapter of which he advocates the subordination of religious dogma to ethics and calls for toleration in the interests of Christian reunion, although the tendencies of his thought are deistic rather than Christian.

In the original text, Saint-Évremond's work circulated in manuscript among his friends, the author refusing to take any part in their publication; many, however, were printed in France and Holland (and translated into English) without his consent, often in heavily censored versions. Shortly before his death, he was persuaded by Des Maizeaux, his Huguenot friend and biographer, to revise what he could of his writings, and it was on the basis of this not entirely adequate revision that they were posthumously published in London (two volumes, 1705) in what became the standard text. A critical edition by R. Ternois of the *Oeuvres en prose* (four volumes) and *Correspondance* (two volumes) began to appear in 1962, based on manuscripts not known to Des Maizeaux and on printed versions which he had unjustifiably neglected. There is a good selection of the literary criticism by M. Wilmotte (1921) and an English translation of his *Letters*, excellently annotated, by John Hayward (1930). The best critical account is in A. Adam's *Histoire de la littérature française au XVII^e siècle*, volume v (1957). *See* also FRONDE. (D. C. P.)

SAINT-EXUPÉRY, ANTOINE MARIE ROGER DE (1900–1944), French aviator and writer, outstanding for his lyrical evocations of the pioneer years of transcontinental flying. He was born at Lyons on June 29, 1900, of an impoverished aristocratic family; received his early education at Jesuit and Marist schools (1909–17); then studied in Paris at the École Bossuet and the Lycée Saint-Louis, hoping to enter the École Navale. Having failed his entrance examination in 1919, he studied architecture for 15 months at the École des Beaux-Arts, and in 1921 was conscripted into the Air Force. He became a qualified pilot in 1922, worked for three years in industry, joined the Compagnie Latécoère in 1926, and helped to open up airmail routes over northwest Africa, the South Atlantic, and South America. In the 1930s he worked as a test pilot, a publicity attaché for Air France, and a reporter for *Paris-Soir*. In 1939, despite permanent disabilities resulting from several serious flying accidents, he became a military reconnaissance pilot; he took part in the Battle of France (1940), and after the fall of France escaped via North Africa to the U.S. In 1943 he rejoined the air force in North Africa, and was shot down over the Mediterranean while on a reconnaissance mission on July 31, 1944.

Saint-Exupéry's writings were all directly inspired by his flying experiences. The novels, *Courrier sud* (1929; English translation *Southern Mail*, 1933) and *Vol de nuit* (1931; Eng. trans. *Night Flight*, 1932), the authentic reminiscences of his civil flying adventures in *Terre des hommes* (1939; Eng. trans. *Wind, Sand and Stars*) and of a reconnaissance sortie in May 1940 in *Pilote de guerre* (1942; Eng. trans. *Flight to Arras*), all extol the virtues of comradeship and devotion to duty, while portraying pilots pitting themselves against desperate odds; the books are a unique blend of graphic narrative, rich in imagery, and of poetic meditation on human values.

Saint-Exupéry's other works include *Le Petit Prince* (1943; Eng. trans. *The Little Prince*), a child's fable for adults, illustrated by himself; *Lettre à un otage* (1943; Eng. trans. *Letter to a Hostage*, 1950); a large unfinished volume of reflections, *Citadelle* (1948; Eng. trans. *The Wisdom of the Sands*, 1952); and several posthumously published volumes of letters, diary extracts, and collected newspaper articles. These all show Saint-Exupéry characteristically preoccupied with the spiritual dangers threatening modern civilization.

See L. Estang, *Saint-Exupéry par lui-même* (1956); R. Rumbold and Lady M. Stewart, *The Winged Life: a Portrait of Antoine de Saint-Exupéry, Poet and Airman* (1953); J. Roy, *Passion et mort de Saint-Exupéry* (1961). (R. D. D. G.)

SAINT FRANCIS RIVER, a tributary of the Mississippi River, U.S., rises in the rugged St. Francois Mountains of southeastern Missouri, flows south to the abrupt edge of the Ozark Plateau at Wappapello, Mo., and thence across the Mississippi alluvial plain to its mouth near Helena in northeastern Arkansas. The topographic contrast between the Ozarks and the alluvial plain is repeated in land use and in stream hydrology. In the plateau lead is mined, much land is forested and beef and dairy cattle are raised, whereas downstream land is almost entirely under crops—cotton, corn, and wheat being most important. Heavy rainfalls in the Ozarks, which make up 70% of the basin, run off rapidly and despite the building of Wappapello Dam in 1941 still cause floods in the lower basin where a shallow gradient, meandering course, and small channel capacity make the river seriously flood-prone. In the 1960s work was partially completed on a Corps of Engineers project to construct levees and ditches and realign channels for practically every mile between Wappapello and the mouth. The lower basin is also flooded by the Mississippi. The river is 425 mi. long, drains 8,400 sq.mi., and crests from January to May. (D. S. St.)

SAINT-GALL: *see* SANKT GALLEN.

SAINT-GAUDENS, AUGUSTUS (1848–1907), U.S. sculptor, well known for his large public monuments, was born in Dublin, Ire., on March 1, 1848. His father was French, his mother Irish. He was taken to New York City in infancy and at 13 was apprenticed to a cameo cutter. By this craft he earned his living, while studying at night at Cooper Union (1861–65) and the National Academy of Design (1865–66) in New York. In 1867 he went to Paris and was admitted to the École des Beaux-Arts. Late in 1870 he set out for Rome, where, still supporting himself by cameo cutting, he worked two years, copying famous antique statues on commission and starting his first imaginative composition, "Hiawatha." Back in New York during the winter of 1872–73 he made several clay portrait studies, including the bust of William M. Evarts, which were carved in Rome between 1873 and 1875.

Saint-Gaudens, now a mature and recognized sculptor, returned to New York early in 1875 and began to play an increasingly active role in U.S. artistic life. With an unusual capacity for friendship, he became acquainted with a group of men who formed a nucleus for an American artistic renascence. The group included Henry Hobson Richardson, Stanford White, Charles McKim, and John La Farge (*qq.v.*). In 1877 Saint-Gaudens went again to Paris, where he carried out, on drawings made in collaboration with La Farge, a reredos for St. Thomas' Church, New York (later burned). He also executed the "Admiral Farragut Monument," Madison Square, New York, the base of which was designed with White.

During his middle period (1880–97) Saint-Gaudens executed most of the well-known works that gained him great reputation and many honours. Again working with La Farge, in 1881 he did two caryatids for a fireplace (now in the Metropolitan Museum, New York) in Cornelius Vanderbilt's residence. In 1887 came the "Amor Caritas," which, with variations, long preoccupied him, and also the standing Abraham Lincoln in Lincoln Park, Chicago. The memorial to Mrs. Henry Adams (1891) in Rock Creek Cemetery, Washington, D.C., is frequently considered Saint-Gaudens' greatest work. The mysterious figure with shadowed face is often called "Grief," but the sculptor had no such intention; "Peace" or "Nirvana" better conveys the meaning. In Boston a monument to

LEET BROTHERS

ADAMS MEMORIAL BY AUGUSTUS SAINT-GAUDENS, 1891. IN ROCK CREEK CEMETERY, WASHINGTON, D.C.

Robert G. Shaw, colonel of a Negro regiment in the Civil War, was completed in 1897 and is remarkable for its expression of movement.

Saint-Gaudens also did many medallions, undertaken originally as diversion from more serious tasks, which show the influence of Renaissance medals and his early cameo cutting. Among these are designs for U.S. coins (the $20 gold piece of 1907 and the head on the $10 gold piece) and a considerable number of portraits, including heads on small bronze plaques ("McKim," 1878), half-length figures on larger plaques ("Bastien-Lepage," 1880), and three-quarter or full-length figures, some in bronze ("Robert Louis Stevenson," 1888), some in marble ("Mrs. Stanford White," 1889). *See* further SCULPTURE: *Late 19th- and Early 20th-Century Conservative Sculpture.*

SAINT-GERMAIN, TREATY OF, the peace treaty between the victorious Allied Powers and Austria after World War I, signed at Saint-Germain-en-Laye, in France, on Sept. 10, 1919.

Whereas Austria-Hungary had fought the war as the Dual Monarchy, the Allies from November 1918 recognized Hungary as a separate state. Other formerly Austrian lands passed to Czechoslovakia, to Poland, to Rumania, to Yugoslavia, and to Italy, so that Austria was thenceforth limited to that Republic of German Austria which had been proclaimed on Nov. 12 (*see* AUSTRIA, EMPIRE OF; AUSTRIA: *History;* HUNGARY: *History*). The Austrian delegation, invited to Paris on May 2, 1919, was headed by the chancellor of the republic, Karl Renner. Its credentials were accepted on May 22, and it was presented with an imperfect draft treaty on June 2 and with a more detailed one on July 20. It protested strongly on two principal issues.

In the first place, the Austrians demanded that the U.S. Pres. Woodrow Wilson's Fourteen Points (*q.v.*) should be applicable in Austria's case, in particular with regard to self-determination for the German subjects of the former Austria-Hungary, whereas the treaty assigned 3,500,000 Germans to Czechoslovakia and about 250,000 to Italy. Wilson alone had been willing to accede to Austria's demand; but France argued that to include the German-inhabited Sudetenland (north of Bohemia and Moravia) in Austria was a geographical impossibility, and Italy insisted on the secret Treaty of London of April 1915, which had promised the German-inhabited South Tirol to Italy so as to make a strategic frontier on the Brenner Pass.

Secondly, the Austrians protested against the extent to which the treaty made the new republic responsible for what Austria-Hungary had done. The Allies, however, finally decided that Austria was not a new state but an old one stripped of certain outlying provinces and endowed with a new government.

Signed on Sept. 10, 1919, the treaty was to come into force on July 16, 1920. It included the Covenant of the League of Nations and defined the frontiers of the republic, except that it provided for a plebiscite in southern Carinthia (*q.v.*) which the Yugoslavs claimed as Slovene-inhabited. For this plebiscite, the area in question was divided between Zone A (the larger zone and the nearer to Yugoslavia) and Zone B (around Klagenfurt, or Celovec); but when Zone A, on Oct. 10, 1920, opted for Austria by 22,025 votes against 15,279, it was decided to hold no plebiscite in Zone B, which thus remained Austrian likewise. On the other hand, Hungary's protest against the treaty's outright transfer of parts of the ancient Hungarian counties of Mosonmagyaróvár (Wieselburg), Sopron (Ödenburg), and Vasvár (Eisenburg) to Austria was met by a later plebiscite (Dec. 14, 1921), whereby the capitals of the counties went to Hungary and the rest of the territory to Austria—to form the province of Burgenland (*q.v.*).

The treaty's Article 88, forbidding any alienation of Austria's independence (without the unanimous consent of the League of Nations), was designed to prohibit union with Germany. It thus underlay the Austro-German tension of the 1930s, which was finally resolved by Hitler's arbitrary *Anschluss* in 1938.

The military clauses of the treaty allowed a long-service voluntary force of 30,000 men. The Austro-Hungarian navy was broken up or distributed among the Allies. In the chapter on reparations Austria accepted responsibility for loss and damage done to the Allies in the war; but the amount due in compensation was left to be determined by the Reparations Commission. Some restitutions in kind were made, but no money was ever paid. The treaty's provisions on reparations and on other financial matters were relaxed by the Supreme Allied Council on March 17, 1921, and the process was completed when in October 1922 Austria received a large loan through the League of Nations.

See HMSO, *Treaty Series*, No. II (Cmd. 400; 1919); H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris*, vol. iv and v (1921).

SAINT-GERMAIN-EN-LAYE, a town of France in the *département* of Yvelines, and a western suburb of Paris, lies 12 mi. (19 km.) from the city centre by road. Pop. (1962) 32,916. Because of its situation (on a plateau about 200 ft. [61 m.] above the left bank of the Seine and protected to the north by the forest of St. Germain), its pure air, the absence of factories, its historical associations, and its proximity to other towns of the Île-de-France (Versailles, Pontoise, Marly-le-Roi, and Mantes), it is a residential and tourist centre. The château, built by Louis VI (1125), burned by the prince of Wales (1346), and reconstructed by Charles V, was finally restored by Francis I. It was the home of many French kings. Mary Stuart lived there, as well as James II of England, who died in exile there and whose tomb is in the parish church. The château now houses the Museum of National Antiquities. Another château, begun in the 16th century, was pulled down two centuries later; all that survives of it is the pavilion, named after Henry IV, in which Louis XIV is reputed to have been born. Near the château is the famous ter-

race of Le Nôtre, 1½ mi. long, opening on an immense panorama of the valley of the Seine, Paris, and the surrounding countryside. (ME. P.)

SAINT GOTTHARD PASS, Switzerland, is an important motor and railway route between central Europe and Italy. It is generally accepted that the pass-route was known to the Romans as far as Hospental, but the pass (6,916 ft. [2,108 m.]) was not generally used as a through Alpine route until the early 13th century. The name St. Gotthard Pass, first mentioned in the early 14th century, is believed to have derived from a hospice built at the summit by the dukes of Bavaria in honour of St. Godehard or Gotthard (d. 1038), bishop of Hildesheim, Ger. First mentioned in 1331, the hospice was from 1683 in the charge of two Capuchin friars. In 1775 the buildings near it were damaged by an avalanche, and in 1799–1800 all buildings were destroyed by French troops. Rebuilt in 1834, the hospice was burned in 1905. A modern hotel now stands at the summit. A mule path across the pass served for many centuries. A carriage road (1820–30) has been replaced by a motorway. Beneath the pass is the St. Gotthard Tunnel (constructed in 1872–80, 9⅓ mi. [15 km.] in length, attaining a maximum height of 3,786 ft. [1,154 m.]), through which runs the railway (opened in 1882) from Lucerne to Milan. This route includes several spiral tunnels in the Reuss and Ticino valleys. A special service enables cars to board trains through the St. Gotthard Tunnel, thus avoiding the long, devious route over the pass, which is often crowded in summer.

See W. W. Hyde, *Roman Alpine Routes* (1935); J. E. Tyler, *The Alpine Passes in the Middle Ages* (1930). (A. F. A. M.)

SAINT HELENA, an island and British colony in the South Atlantic situated 1,150 mi. (1,850 km.) from the west coast of Africa, in latitude 16° S and longitude 5° 45′ W. Area 47 sq.mi. (122 sq.km.); extreme length, southwest to northeast, 10½ mi. (17 km.), extreme breadth 6½ mi. (10½ km.).

Physical Features.—The island is of volcanic origin, activity being long extinct, while subaerial denudation has greatly modified the landscape and marine erosion has formed perpendicular cliffs 450 to 2,000 ft. high on the east, north, and west. Its principal feature, a semicircular ridge of mountains, with the twin culminating summits of Mt. Actaeon (2,685 ft. [818 m.]) and Diana Peak (2,800 ft. [853 m.]), forms the northern rim of the great amphitheatre of Sandy Bay. South of the ridge water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some 1,000 ft. deep, containing small streams. Springs of pure water are numerous. The lavas are basalts, andesites, trachytes, and phonolites; there is much volcanic ash, tuff, scoriae, etc., and conspicuous features are formed by rocks representing a late period of activity. Such features are The Asses Ears, Lot and Lot's Wife, and The Chimney. The only practicable landing place is on the leeward side at James Bay. From the head of the bay a narrow valley extends for 1½ mi. The greatest extent of level ground is in the northeast of the island where the Deadwood and Longwood plains lie at an altitude of more than 1,600 ft.

EMIL BRUNNER—PIX FROM PUBLIX

JAMESTOWN, THE CAPITAL OF ST. HELENA, AND JAMES BAY

Although the island is within the tropics, its climate is healthy and temperate because of the southeast trade wind and the effect of the cold waters of the South Atlantic Current. The temperature varies at sea level from 20°–32° C (68°–90° F) in summer and 14°–29° C (57°–84° F) in winter. The higher regions are 5°–6° C cooler. The rainfall varies greatly with altitude, from 8 in. at sea level to more than 30 in. in the centre of the island.

Vegetation.—St. Helena has three vegetation zones: (1) the coast zone, extending inland for 1 to 1½ mi., now "dry, barren, soilless, lichen-coated, and rocky," with little except prickly pears, wire grass, and *Mesembryanthemum;* (2) the middle zone (1,400–1,800 ft.), extending ¼ to 1 mi. farther inland, with shallower valleys and grassier slopes with English broom and gorse, brambles, willows, poplars, and Scotch pines; and (3) the central zone, about 3 mi. long and 2 mi. wide, the home, for the most part, of the indigenous vegetation. Many of the indigenous species have become extinct, but by the early 1960s all the surviving ones were protected. The indigenous vegetation shows affinities with that of Africa, and the many exotics give the island almost the aspect of a botanical garden; the oak, thoroughly naturalized, grows next to the bamboo and banana. Common trees include the indigenous cabbage tree (*Senecio*), the cedar, and the eucalyptus. The New Zealand flax (*Phormium tenax*) was introduced from that country, its commercial success varying with market conditions.

Animal Life.—Besides domestic animals the only land mammals are rabbits, rats, and mice, the rats being especially abundant. The only native land bird is a small plover called the wirebird, *Charadrius sanctaehelenae.* Introduced birds now common on the island include the Indian mynah, avadavat, Java sparrow, cardinal, ground dove, partridge (the Indian chukar), and ring-necked pheasant. Among sea birds are the sooty, white, and noddy terns. There are no freshwater fish but of 65 species of sea fish caught 17 are peculiar to St. Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavally, flounder, hogfish, mullet, and sculpin.

(G. A. J.; J. D. HA.; RO. E. A.)

History.—The island was discovered on May 21, 1502, the anniversary of St. Helena, mother of the emperor Constantine, by the Portuguese João da Nova Castella, on his voyage home from India. Its first known permanent resident was Fernando Lopez, a Portuguese in India who had turned traitor and had been mutilated by order of Affonso de Albuquerque. Rather than return to Portugal, he was voluntarily marooned on the island in 1516 and died there in 1545. The first Englishman known to have visited St. Helena was Thomas Cavendish, who touched there in June 1588 during his voyage around the world. Another English seaman, Capt. G. Kendall, visited St. Helena in 1591, and Sir James Lancaster stopped at the island on his way home from the east in 1593 and again in 1603. The Portuguese had by this time given up calling at the island, which may have been occupied by the Dutch from about 1645 to 1651. The English East India Company dispatched a small force of troops and others under John Dutton to form a settlement there in 1659. The company, which was confirmed in possession by a clause in their charter of 1661, built a fort and named it after the duke of York (afterward James II).

On New Year's Day, 1673, the Dutch succeeded in capturing St. Helena, but they were ejected the following May by Sir Richard Munden. By a new charter granted in December 1673 the East India Company was declared "the true and absolute lords and proprietors of the island." Thereafter St. Helena was in the undisturbed possession of Great Britain. In 1673 nearly half the inhabitants were slaves imported from the East Indies or Madagascar. In 1810 the company began to bring in Chinese from their factory at Canton. During the company's rule the island prospered; vessels bound for England, numbering hundreds in a year, anchored in the roadstead and stayed for considerable periods,

refitting and revictualing. Large sums of money were thus expended in the island, where wealthy merchants and officials had their residence. The slaves who worked the plantations were subjected to barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas Day, 1818, should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St. Helena was one of the Huguenot refugees, Capt. Stephen Poirier (1697–1707). A later governor (1740–42) was Robert Jenkins of "Jenkins' Ear" fame (*see* JENKINS, ROBERT). The astronomer Edmund Halley resided in the island in 1676–78 and his observatory was on Halley's Mount.

In 1815 the British government selected St. Helena as Napoleon's place of detention. The former emperor was taken to the island in October of that year and lodged at Longwood, where he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the crown. After Napoleon's death the East India Company resumed full control of St. Helena until April 22, 1834, on which date, by virtue of an act passed in 1833, it was vested in the crown. As a port of call the island continued to enjoy a fair measure of prosperity until about 1870.

Afterward the great decrease in the number of vessels visiting Jamestown deprived the islanders of their principal means of subsistence. When steamers began to be substituted for sailing vessels and when the Suez Canal was opened (1869), fewer ships passed the island and fewer still found it necessary to call. The withdrawal in 1906 of the small garrison hitherto maintained by the imperial government was another cause of depression, but during World War I the island was again garrisoned. During the South African War (1899–1902) nearly 6,000 prisoners were detained at St. Helena. In 1922 Ascension Island, up to that time under the care of the British Admiralty, was made a dependency of St. Helena. Similarly, Tristan da Cunha and its associated islands became dependencies of St. Helena in 1938.

The island was of strategic importance in the naval operations of World War II. After the war, it returned to its quiet and uneventful life. The rapid development, from 1960 onward, of both St. Helena and Ascension (*q.v.*) as important telecommunication centres restored St. Helena to a modest state of prosperity.

(G. A. J.; J. D. HA.; J. O. F.)

Population.—The majority of the population are of mixed European (mostly British), Asian, and African descent. After the original settlement by John Dutton, more soldiers and settlers were sent from England and their numbers were augmented by members of the crews of ships returning to Europe from the east. For a considerable period from 1840 onward there was an influx of freed slaves of west African origin. The population of the colony in 1964 was 4,613, of whom about one-third lived in Jamestown, the port and capital. Longwood is 3½ mi. SE of Jamestown. Most of the population is Anglican by religion. St. Helena is the seat of an Anglican bishopric (now within the province of South Africa) established in 1859. Ascension Island (*q.v.*) is also in the diocese. English is the only language spoken.

Administration.—St. Helena is administered by a governor. The St. Helena Royal Instructions provide for an executive council consisting of the government secretary and the colonial treasurer *ex officio*, two other official members, and from one to three unofficial members appointed by the governor from among the members of the advisory council, of whom at least one must be an elected member; and for an advisory council consisting of four officials, four unofficial members appointed by the governor, and eight elected members. The governor makes ordinances, after consulting the advisory council, but power is reserved to the sovereign in council to legislate by order.

The Supreme Court exercises jurisdiction over St. Helena and Ascension Island (*q.v.*); the chief justice, who is normally the governor, is the only judge. There are also a magistrate's court and a court for adjudicating small debts.

There is a single general hospital, in Jamestown, and in the country districts six health clinics. The health service is wholly operated by government medical and sanitary staffs.

Education is compulsory and is provided free for all children between the ages of 5 and 15 years. There are 11 senior and junior primary and infants' schools and one secondary school; the total number of pupils is about 1,400.

No defense forces are stationed or based on the island, the defense of which is a United Kingdom responsibility.

Economy.—Less than a third of the area of the island is suitable for farming or forestry. The principal crops are *Phormium* flax, potatoes, and green vegetables. Cattle, sheep, pigs, and goats are raised for local consumption. Lace and drawn-thread work of excellent quality are sold to passengers from the few ships which now call. Lack of frequent communications with the island operates against the development of a tourist industry on a residential basis. The principal exports are *Phormium* fibre, tow, rope and twine, and small quantities of wool. Attempts to exploit the commercial possibilities of the fisheries on an export basis have more than once proved unsuccessful. Electricity was becoming available in the early 1960s throughout the island. Funds provided under the series of Colonial Development and Welfare acts have enabled the government to undertake extensive reafforestation and pasture reclamation; dilapidated institutions and school buildings have been replaced; the road system is in excellent condition; and attention has been paid to water supplies and housing. The colony's expenditure runs at more than £200,000 ($560,000); local revenue is about one-third of this, the balance being made up from U.K. funds. The only banking institution is the government savings bank. Bank of England notes and the coinage of the United Kingdom are legal tender. There is a mail shipping service to England and to South Africa, but no air service. There are direct cable communications with Cape Town and Porthcurno, Eng. (for London).

SAINT HELENS, a municipal, county, and parliamentary borough, Lancashire, England, 12 mi. (19 km.) ENE of Liverpool by road. Pop. (1961) 108,674. Area 12.4 sq.mi. (32 sq.km.). The town's modern development began with the opening of coal mines in the 17th century and was furthered when glass works were started in 1773. It is one of the world's biggest glass-making centres. The industry is based on field sand found in southwest Lancashire. Other important manufactures include patent medicines, iron and brass foundries, pottery, and textiles. There is a trading estate at Parr. St. Mary's Church occupies the site of "Sainct Elyn's Chapell" after which the town is named. The Gamble Institute houses a technical school and a public library. The town was incorporated in 1868, became a parliamentary borough in 1885 and a county borough in 1888.

SAINT HELIER, the chief town in Jersey (*q.v.*), Channel Islands, takes its name from a Frankish saint who came to the island in the 6th century. Pop. (1961) 26,594. Its nucleus is built on marshy ground by the southeastern shore of St. Aubin's Bay, opposite a tidal island known as l'Islet. There was no harbour until the 18th century, the chief landing-place throughout the Middle Ages and later being at St. Aubin's across the bay; and the principal medieval castle was at Gorey a few miles away on the east coast. There was at that time no settlement in Jersey that could be called a town, for the island, lying off the shipping lanes, had no share in general mercantile activity such as Guernsey enjoyed.

The saint's memory is preserved in a small oratory (*c.* 12th century) perched on a rock off l'Islet, in the dedication of the parish church (the earliest mention of which in surviving documents is of the mid-11th century), and in the Abbey (later priory) of St. Helier founded on l'Islet in the mid-12th century by Robert Fitz Hamon, earl of Gloucester. A fishing village must have grown up beside the parish church; from the 13th century onward the king's courts usually met there, and a market was held there. The virtual abandonment of Mont Orgueil Castle at Gorey during the 16th century and its replacement by Elizabeth Castle on l'Islet (be-

gun 1550; more serious work from 1594 when Paul Ivy was engineer), and the building of a courthouse made St. Helier the centre of island government. Harbour works were begun in 1700 and the modern harbour in 1841. In 1736 the historian Philippe Falle (who recorded the number of houses in St. Helier as 400 in 1734) left his books to the island and these formed the nucleus of a fine public library. The market place (now Royal Square) is still the natural centre of the town and its chief claim to architectural distinction. About half the population of Jersey lives in St. Helier, which is now the focus of transport and commerce as well as of government and cultural activity.

See E. T. Nicolle, *The Town of St. Helier* (1931); N. V. L. Rybot, *The Islet of St. Helier and Elizabeth Castle, Jersey* (1934). (Le P.)

SAINT HUBERT, a town of Belgium in the province of Luxembourg, on the Ardennes Plateau, 48 mi. (77 km.) SE of Namur by road. Pop. (1961) 3,108. The 16th–17th century abbey church contains relics of St. Hubert, patron of huntsmen, whose vision of a stag with a crucifix between its antlers is said to have occurred in the nearby Forest of Freyr in 683. An abbey founded in 687 by Plectrude, wife of Pepin of Herstal, preceded the Benedictine abbey of 817, which was occupied until 1789. The last abbot, Nicolas Spirlet, established steel forges and gun foundries nearby. The present buildings (1729) were used as a penitentiary until 1954. Pierre Joseph Redouté (1759–1840), the celebrated flower painter, was born at St. Hubert. (R. M. An.)

SAINT-HYACINTHE, a city in Quebec, Can., the seat of Saint-Hyacinthe County, is 50 mi. (80 km.) ENE of Montreal on the Yamaska River and the Canadian National Railway. Pop. (1961) 22,354 of whom 98% are French-Canadian. It is the seat of a Roman Catholic bishopric and contains a classical college, a technical school, a dairy school, monasteries, and other educational institutions. It is the commercial, cultural, and administrative centre for the surrounding agricultural area. Manufactures are important and include organs, woolen and other textiles, garments, marine engines, cutlery, hairpins, leather and rubber goods, cigars, and precision instruments. Its name is derived from Hyacinthe de Lorme who bought the territory in 1753. (W. F. Ss.)

SAINT IVES, a municipal borough and fishing port in the St. Ives parliamentary division of Cornwall, Eng., 20 mi. (32 km.) NE of Land's End and 8 mi. (13 km.) N by E of Penzance by road. Pop. (1961) 9,346. Area 6.7 sq.mi. (17 sq.km.). It lies on the north coast, its small harbour sheltered from the Atlantic by The Island, a strip of land running out to a granite knoll. The picturesque old town, with its winding streets and colour-washed stone cottages housing fishermen and artists, with their boats, clusters along this strip and round the harbour; the ground rises steeply behind, and to the southeast a modern residential quarter extends around the sandy bay for about 2½ mi. to Carbis Bay. Fishing and tin-mining were important until the late 19th century when pilchards ceased to visit the waters and many miners emigrated. The beautiful sandy beaches and the mild climate inspired the inhabitants to make St. Ives a holiday centre, and this trade has superseded the others.

The name St. Ives commemorates St. Eia, a 5th-century woman missionary who, according to tradition, floated over from Ireland on a leaf (coracle) and was later martyred. The present church of St. Ia is of the 15th century with a noble tower. Perkin Warbeck was proclaimed King Richard IV when he anchored in St. Ives Bay in 1497. In 1639 a charter of incorporation was granted with provision for four fairs annually, two weekly markets, and a grammar school, but as the town declared for Parliament in the Civil War its charter was withdrawn by Charles II. The present charter was granted in 1690. The guildhall was completed in 1940.

SAINT IVES, a market town and municipal borough in Huntingdon and Peterborough, Eng., mainly on the left bank of the Ouse, 6 mi. (10 km.) E of Huntingdon. Pop. (1961) 4,082. The river is crossed by a 15th-century bridge with a chapel over the centre pier that was restored in 1689. The Church of All Saints is Perpendicular. Oliver Cromwell lived in Old Slepe Hall (demolished 1848) for five years, and his statue stands in the market place, the centre of the town. St. Ives was noted for its eight-day fair beginning on Monday in Easter week, granted to the abbot of Ramsey by Henry I. In the reign of Henry III merchants from Flanders came to the fair, which had become so important that the king granted it to be continued beyond the eight days if the abbot agreed to pay a fee of £50 yearly for the extra days. The fair, with a market on Monday granted to the abbot in 1286, survives and was purchased by the town in 1874, the year of incorporation, from the duke of Manchester. The markets, extremely important to St. Ives as an agricultural centre, were substantially altered to give greater facilities for auction sales. The Norris Library and Museum, opened in 1933, is mainly devoted to books and collections relating to the county.

SAINT JAMES, a city adjacent to Winnipeg in Manitoba, Can., was incorporated in 1956. Pop. (1964) 34,459. The district was named in 1853 when a parish was established and a church begun to accommodate Church of England settlers along the Assiniboine River. From 1880 to 1920, when St. James municipality was organized, the parish was part of the rural municipality of Assiniboia. Almost completely residential until after World War II, the city experienced considerable growth in apartment and home building, and attracted many commercial firms and light industries, most of which came from the older commercial district of downtown Winnipeg. Within the city limits are the airport for Greater Winnipeg which serves a number of domestic and international airlines; a permanent RCAF base; and Deer Lodge Military Hospital, established after World War I to provide hospital and medical care for veterans from Manitoba and northwestern Ontario. (H. W. L. B.)

SAINT-JEAN (St. Johns), the county seat of Saint-Jean County, Que., Can., 20 mi. SE of Montreal and on the west bank of the Richelieu River. Pop. (1961) 26,988, of which over 88% was French-speaking. Fort St. John was established on the site in 1748. Later the city was important as a trading centre on the canal system which connected Sorel, on the St. Lawrence below Montreal, to Lake Champlain, and thence to the Hudson River in New York State, and as the terminus of the first railway in Canada from Montreal. Its excellent location in respect to rail, road, and canal routes, markets, and available labour force helped to maintain it as an important commercial and industrial centre. Manufacturing is important, the principal products being sewing machines, ribbons, wooden articles, bricks, textiles, and metallurgical products. (W. F. Ss.)

SAINT-JEAN-DE-LUZ, a coastal town of the extreme southwest of France, in the *département* of Basses-Pyrénées, lies on the Bay of Biscay, 13 mi. (21 km.) SW of Bayonne by road. Pop. (1962) 9,056. The town is situated on the right bank of the Nivelle River at its mouth. A fine esplanade occupies the curving sandspit that obstructs the river as it enters the sea, and the channel is protected by moles. Across the river, Ciboure, as its name signifies, is a bridgehead settlement, and most of the fishermen now live there. The composer Maurice Ravel was born at Ciboure. The 13th-century church at Saint-Jean-de-Luz is the finest of the distinctive Basque churches, with wooden galleries in the nave reserved for men, according to Basque custom. From the 14th to the 17th century Saint-Jean-de-Luz was a prosperous fishing port, whose sailors were the first to fish the waters off Newfoundland early in the 16th century. In 1660 the marriage of Louis XIV and Maria Theresa took place at Saint-Jean-de-Luz. At this time its population numbered about 15,000. The cession of Newfoundland to England in 1713 and the loss of Canada contributed, along with the silting of the harbour and a disastrous storm of 1749, to bring about the decline of the port and decay of the town. It has revived in modern times as a tourist resort, active in winter as well as in summer. Sardine fishing was formerly important, but fishing is now chiefly concerned with tunny, for which Saint-Jean-de-Luz leads among French ports. Since 1953 the Basque Yacht Club has organized a tunny fishing championship there for amateurs. (Ar. E. S.)

SAINT-JÉRÔME, a city and the seat of Terrebonne County, Que., Can., is on the North River 38 mi. (61 km.) N of Montreal. Pop. (1961) 24,546. Known as "Queen of the North," it is the gateway to the Laurentians, the basis of its profitable tourist in-

dustry. The first settlers arrived in 1818, and the parish was established in 1834. First called Dumontville, in honour of Seigneur Dumont of Saint-Eustache, the name was changed on incorporation as a village in 1856. Saint-Jérôme enjoyed a period of rapid expansion after the arrival in 1868 of Curé Antoine Labelle, a physical giant who served for some years as Deputy Minister of Colonization, and whose zeal and energy helped make Saint-Jérôme an important distribution centre for new colonization districts, the tourist industry, and forest exploitation. Other important industries include a rubber footwear company, knitting and textile mills, and foundries. (J. P. Le.)

SAINT JOHN, OLIVER (*c.* 1598–1673), English parliamentarian, a prominent Independent during the Civil War and an intimate of Cromwell, was chief justice of the Court of Common Pleas during the Commonwealth. He was the son of Oliver St. John of Cayshoe, Bedfordshire, and great-grandson of the 1st Baron St. John of Bletso. Educated at Queens' College, Cambridge, he was called to the bar at Lincoln's Inn in 1626. He was brought before the Star Chamber in 1630, together with the earl of Bedford who employed him as his lawyer, charged with the publication of a seditious libel, but the case was dismissed. He was a member of the company formed to colonize Providence Island (now Providencia) in the Caribbean Sea in 1630. In 1638 his marriage to his second wife, Elizabeth Cromwell, a cousin of Oliver Cromwell, led to an intimate friendship with Cromwell. M.P. for Totnes, Devon, in both the Short and the Long parliaments, St. John was closely allied with Bedford, John Pym, and Hampden and led the attack on ship money (*q.v.*). In an attempt to win his support, Charles I appointed him solicitor general in January 1641. St. John's political views, however, remained unchanged and in the same year he took an active and savage part in promoting the impeachment and attainder of Thomas Wentworth, earl of Strafford, and helped in preparing other bills, such as the Militia Bill, for the opposition.

During the Civil War St. John became a recognized leader of the Independents and supported the Army in its quarrel with Parliament in 1647. He was appointed chief justice of the Court of Common Pleas in October 1648. Although he retained his seat for Totnes, his legal office debarred him from sitting in the Commons and he took no part in the debates and refused to act as a commissioner at the king's trial (1649). In 1652 he was one of the commissioners responsible for bringing about the union between England and Scotland, and he was among those who pressed Cromwell to take the title of king in 1657. After the Restoration of Charles II, he published in 1660 a defense of his past conduct, *The Case of Oliver St. John,* and his only punishment was exclusion from holding public office. He retired to Northamptonshire until 1662 when he went to the continent. He died on Dec. 31, 1673. The place of his death is not known. (G. H. J.)

SAINT JOHN, the capital of St. John County and the largest city in New Brunswick, Can. Pop. (1961) city, 55,153; metropolitan area, 95,563.

Situated on a rocky peninsula at the mouth of the St. John River, the city has enjoyed importance as a port and as the gateway to the vast timber resources of the St. John River Valley. The sheltered harbour has a depth of 32 ft. at low tide and 58 to 60 ft. at high tide, and is ice-free throughout the year. The river enters the harbour through a narrow rock gorge, making a 17-ft. descent to the ocean at low tide. At slack tide ships may pass through the gorge. With the rising tide ocean waters force themselves upstream, giving rise to the phenomena called the "reversing falls." (*See* also Fundy, Bay of.)

The site was visited in 1604 by Sieur de Monts and Samuel de Champlain, but it was not until 1635 that Charles de la Tour established a trading post called Fort St. Jean, a fortification which was subsequently renamed, abandoned, and rebuilt several times. In 1713 Acadia was ceded to England and in 1758 Col. Robert Monckton refortified the site, calling it Fort Frederick. In 1783 a large body of United Empire Loyalists landed at Saint John, establishing Parr Town on the peninsula and Carleton across the harbour. By royal charter in 1785 the two areas became the city of Saint John, the oldest incorporated city in present-day Canada. Council-manager government was adopted in 1962.

Under protective British tariffs the city flourished during the early and middle 1800s. Wooden shipbuilding was a major industry and the lumber and fish trades boomed. Railway connections with Moncton were completed in 1860, and in 1890 with Montreal via the Canadian Pacific Railway's "short line" through the state of Maine. The city's growth was checked by a disastrous fire in 1877 and by the decline of the lumber trade and wooden ships in the late 1800s.

The city is an important distributing centre and a major Canadian winter port. A pulp and paper plant, oil and sugar refineries, a large brush factory, a large dry dock, and a variety of light manufacturing industries are located in the area. The municipal airport gives connections with Halifax and Montreal, and there is regular boat service across the Bay of Fundy to Digby, Nova Scotia. (C. W. Rd.)

SAINT JOHN ISLAND, the smallest (20 sq.mi.) of the Virgin Islands (*q.v.*) purchased by the United States from Denmark in 1917. It was discovered by Columbus, Nov. 17, 1493. The fierce aboriginal Carib Indians were exterminated, but the island was not settled until 1717 by planters from Saint Thomas Island (*q.v.*), 4 mi. E. In 1733 the population consisted of 208 whites and 1,087 slaves. The latter launched a formidable insurrection on Nov. 13, 1733, that was not crushed until July 1734. Denmark emancipated the slaves in 1848. The predominantly Negro population (925 in 1960) is concentrated in the two settlements: Cruz Bay and Coral Bay (the best harbour refuge in the West Indies) at the western and southeastern ends of the island respectively.

Some cattle are raised and bay leaves (for bay rum) gathered from the forest around Bordeaux Mountain (1,277 ft.).

The Caneel Bay Tourist Development and the preservation of a large part of this mountainous island by the United States National Park Service serve to attract an increasing number of tourists. (R. W. Ln.)

SAINT JOHN OF JERUSALEM, ORDER OF THE HOSPITAL OF, a religious and military order of hospitallers founded at Jerusalem in the Middle Ages, which continues its humanitarian tasks in most parts of the modern world under several slightly different names and jurisdictions. It was known as the Order of the Knights of Rhodes while it ruled that island (1309–1522) and as the Sovereign and Military Order of the Knights of Malta during its tenure of Malta (1530–1798). From 1834 it has been called the Sovereign and Military Order of the Knights Hospitaller of St. John of Jerusalem, with headquarters in Rome. The English grand priory, suppressed by Henry VIII, was revived in 1831 and received a royal charter in 1888 as a British order of chivalry. The German branch of the order, which became Protestant at the Reformation, kept its old name of Johanniterorden, and there are associations and independent orders in other northern European countries and in the United States.

In Palestine.—The origin of the Hospitallers was an 11th-century hospital in Jerusalem, close to the church of St. John the Baptist, founded by Italian merchants from Amalfi to care for sick pilgrims. After the crusaders' conquest of Jerusalem in 1099, the hospital's superior, a monk named Gerard, intensified his work in Jerusalem and founded hostels in Provençal and Italian cities on the route to the Holy Land. On Feb. 15, 1113, the hospital was taken under papal protection, a status confirmed by later popes. Raymond de Puy, who succeeded Gerard in 1120, substituted the Augustinian rule for the Benedictine and took the title of master of the Hospital of St. John of Jerusalem. Under Raymond the hospital was soon involved in responsibilities entirely transcending its original eleemosynary character. Grateful crusader knights healed of their wounds in the hospital bestowed on it portions of their estates, while others remained in the Holy Land as members of the hospital, which thus developed into a wealthy and powerful body, dedicated to combining the task of tending the sick and poor with waging war on Islam in the Levant.

The Hospitallers and the Templars (*q.v.*), another military order of contemporary foundation, became, although often acting in opposition to one another, the most formidable instruments of

war of the Latin kingdom. Ultimately the two orders weakened the secular monarchies by usurping, through their greater resources, the place of the sovereigns' direct feudal lieges, while their spiritual independence of the bishops rendered them obnoxious to the secular clergy. But the Hospitallers never ceased to be honoured for their hospital, where the sick were tenderly cared for no matter what their religion or country of origin.

Until the defeat of the crusaders at Hattin in 1187, the Hospitallers, based on the two great castles of Margat (Marqat), and Krak des Chevaliers (Qalat al Hosn), played a vigorous part in holding the Muslims at bay. When the latter recaptured Jerusalem in 1187, the Hospitallers removed their headquarters first to Margat and then in 1197 to Acre, where they established their hospital. During the Third Crusade, which failed to recapture Jerusalem, they supported Richard I of England in his victory at Arsuf. In later Crusades they held Krak until 1271 and Margat until 1285.

Cyprus and Rhodes.—When the crusader principalities came to an end after the fall of Acre in 1291, the Hospitallers moved to Limassol in Cyprus. At a chapter-general held in their commandery at Kolossi nearby, they decided to continue their work for the pilgrims and the sick and to remain close to the Holy Land in the hope of its reconquest. A hospital was built and the grand master Guillaume de Villaret carried out internal reforms through a new body of statutes. In 1309 the Hospitallers acquired Rhodes, where almost at once they began to build a hospital, which was later enlarged and improved. They ruled the island as an independent state, with the right of coinage and other attributes of sovereignty, and for more than two centuries they were the scourge of Muslim shipping on the eastern Mediterranean (*see* RHODES).

By the 15th century the Turks had succeeded the Arabs and Kurds as the protagonists of militant Islam. The sultan Mohammed the Conqueror decided that this Christian spearhead must be broken, but his siege was repelled by the knights under their grand master Pierre d'Aubusson in 1480. Suleiman the Magnificent renewed the siege in 1522 when the knights' spectacular resistance was hamstrung by lack of support from other Christian powers. After six months the grand master Philip Villiers de l'Isle Adam capitulated, to save the civil population from massacre, and on Jan. 1, 1523, the knights sailed out of Rhodes with as many of the citizens as chose to follow them.

Organization.—Under the order's rule, the master (grand master from 1489) was elected for life and ruled a celibate brotherhood of knights, chaplains, and serving brothers. His election was subject to papal confirmation. Only the knights had a voice in the government of the order, through its legislative body, the chapter-general, convoked by the grand master. Always an international body, the order of St. John while at Rhodes evolved its characteristic form by grouping the knights into Langues (*i.e.*, "tongues"). Originally seven (Provence, Auvergne, France, Italy, Spain, England, and Germany), they became eight when the Spanish Langue split into those of Castile-Portugal and Aragon. (In 1782 during the order's last days in Malta, the two Langues of England and Germany were unexpectedly brought together through the creation of an Anglo-Bavarian Langue by the grand master Emmanuel de Rohan and the elector of Bavaria, with the consent in 1783 of King George III of England.) To each Langue was entrusted, in Rhodes as later in Malta, the defense of one sector of the fortifications.

In Rhodes, as in Malta, each Langue had its headquarters in its own *auberge* ("inn" or hostel) where its members messed and lodged. The head of the Langue, known as the "pillar," presided over his *auberge* and was *ex officio* a bailiff of the order, a member of the chapter-general, and one of the great officers of the convent. There grew up in Rhodes and was maintained in Malta the practice of permanently allocating the various great offices to the pillar of a particular Langue. The pillar of France was the grand Hospitaller, the senior dignitary after the grand master; the pillar of Castile was the grand chancellor, the pillar of Italy the grand admiral, and the pillar of Provence the grand commander, with charge of the treasury. The pillar of England held the important command of the coastal defenses and bore the title of Turcopolier, derived from the native mounted bowmen known as Turcopoles whom the order recruited in Palestine during the Crusades. The chaplains were subordinate to the prior of St. John.

The considerable estates of the order belonged to the Langue of the country in which they were situated and were graded, according to size and importance, into commanderies, priories, and bailiwicks, under commanders, priors, and bailiffs, respectively. National or territorial groups of priories and other units were termed grand priories, and the grand priors were members of the chapter-general. Each unit contributed at least one-third of its revenues to the upkeep of the armed forces, hospital, and other activities of the order at its centre. The badge of the order is the white eight-pointed cross of Amalfi.

In Malta.—After their expulsion from Rhodes, the knights were without a base for seven years, while their grand master De l'Isle Adam made the rounds of the courts of western Europe in a vain quest of aid toward its reconquest. In 1530 the emperor Charles V gave them the Maltese archipelago in return for the annual presentation of a falcon to his viceroy of Sicily and the obligation of securing Tripoli in Libya against the Muslims. Their failure to hold Tripoli in 1551 led to Suleiman the Magnificent's attempt to dislodge them from Malta in 1565. The superb leadership of the grand master Jean Parisot de La Valette, the sustained heroism of the members of the order, and the endurance of the Maltese population prevented one of the most famous sieges of history from ending in disaster (*see* MALTA: *History*). What was left of the Turkish Navy as a striking force was permanently crippled in 1571 at the Battle of Lepanto by the combined fleets of Philip II, the Knights of St. John, Venice, Genoa, Savoy, and the pope.

After the victory, the knights proceeded with the building of their new capital, which they named after La Valette, the hero of the siege (*see* VALLETTA), and with their work on the defenses of both sides of the grand harbour. The hospital, with its ward 502 ft. in length, attracted many patients from outside Malta. These were well cared for, with no more than one to a bed, their food was well planned, and the mentally sick were treated humanely. Surgical and medical cases were kept separate, infectious diseases were isolated, and ophthalmology was a specialty. In 1674 the grand master founded a school of anatomy and medicine for the order's physicians. Anatomy was studied with the bodies of deceased knights and patients, at a time when dissection elsewhere tended to be forbidden.

As the 17th century advanced, the Turkish menace receded. For a brief period the order possessed the nucleus of a colonial dominion in the New World: the West Indian Islands of St. Martin, St. Croix, and St. Bartholomew, and part of St. Christopher (St. Kitts), bought from King Louis XIV of France in 1653 but relinquished by the order, as an unnecessary encumbrance, to the French West India Company at a handsome profit in 1665. By the 18th century the order as a territorial sovereign state committed to wage war on Islam had become an anachronism, but its hospital continued to be in the forefront of medical care. After the outbreak of the French Revolution the rich properties of the three French Langues were confiscated in 1792, and in 1798 Malta was occupied by Napoleon on his way to Egypt, the grand master Ferdinand von Hompesch offering no resistance. The order's return to Malta was provided for in the Treaty of Amiens (1802) but eliminated by the Treaty of Paris (1814), which assigned Malta to Great Britain.

In Russia.—On the final partition of Poland in 1797, the grand priory of Poland, which had formed a part of the Anglo-Bavarian Langue, became known as the grand priory of Russia and was taken under the protection of the emperor Paul I, who, though Orthodox, became grand master of the order (1798), in the face of strong papal disapproval. Paul's successor, Alexander I, declined to be grand master, but the Orthodox grand priory in Russia existed until the Revolution (1917).

The Sovereign Military Order from 1801.—G. B. Tommasi, who became grand master in 1803, died in 1805, disappointed in his hope to lead the knights back to Malta from his temporary headquarters in Sicily, at Messina. Thenceforth the Sovereign and Military Order of the Knights Hospitaller of St. John of

Jerusalem, permanently established in Rome in 1834, confined its activities to its original humanitarian tasks. From 1805 it was ruled by lieutenants until Pope Leo XIII revived the grand mastership in 1879. Toward the end of the life of the grand master (1931–51) Ludovico Chigi della Rovere Albani differences with the Holy See delayed until 1962 the election of a successor. A new constitutional charter was drawn up in 1957.

Although the order no longer exercises territorial rule it issues passports and its sovereign status is recognized by the Holy See and those other Roman Catholic states to which it accredits ministers plenipotentiary or delegates with diplomatic status. Of its original regional units there survive five grand priories: of Rome, Lombardy-Venice, Naples-Sicily, Austria, and Bohemia-Moravia (the last only in name). Elsewhere the members are grouped under national associations, as for instance that in the United States.

Membership is confined to Roman Catholics and is divided into three categories, each with subdivisions. The first consists of the "professed" knights of justice and chaplains who can prove the nobility of their four grandparents for two centuries and have taken either "simple" or "solemn" religious vows including that of celibacy; the second, of knights and Donats (men of knightly but not sufficiently noble birth) of honour and devotion, who must prove the same nobility but are not "professed"; the third, of seven grades differing in nobiliary and other qualifications. While the order remains essentially an aristocratic body, the requisite "quarters" for the third category vary with grade and country (particularly in the New World); in the case of knights of magistral grace appointed "by merit" they may be dispensed with altogether. Women are admitted to the second and third categories.

The Most Venerable Order.—With the sequestration of the English grand priory's properties by Henry VIII in 1540 the English Langue virtually became dormant for three centuries except for a brief revival by Mary I (whose letters patent restoring it were not revoked) and the appointment by the grand masters of titular nonresident grand priors of England, the last of whom held his nominal office from 1806 until 1815. In 1831 the grand priory was resuscitated on a basis mainly Anglican on the initiative of a group of knights of the French Langues known as the "Capitular Commission." The Sovereign Military Order in Rome first accepted this step, then repudiated it in 1858. In 1963, however, the Sovereign Military Order and the Most Venerable Order signed a formal declaration defining their mutual relationship.

By royal charter of 1888 the revived grand priory of England was converted by Queen Victoria into a British order of chivalry, bearing the prefix "most venerable." The reigning monarch is its sovereign head, and the grand priors appointed since 1888 have been members of the British royal house. A later royal charter of 1926 authorized the creation of priories and commanderies in the Commonwealth overseas. For day-to-day purposes the grand prior acts through his deputy, the lord prior of St. John. All Christians are eligible, and women are admitted to all grades of the order except the last (bailiffs and dames grand cross; knights and dames of justice or of grace; commanders; officers; serving brothers and sisters; esquires) but not to membership of the chapter-general, which under the sovereign head and the grand prior is the governing body. The executive officers are the heads of the order's departments. Appointments to and promotions in the order are made by the sovereign head on the recommendation of the chapter-general as approved by the grand prior. This direct access to the throne is a relic of the independent status of the original order.

The "establishments" of the order are the priories of Scotland, Wales, Canada, Australia, New Zealand, and South Africa. There are commanderies in Western Australia, Northern Ireland, and Central Africa, and St. John organizations in most of the colonies and dependencies. An American Society of the Most Venerable Order of the Hospital of St. John of Jerusalem was set up in the United States in 1960.

The order performs its humanitarian work through its three "foundations": the St. John Ophthalmic Hospital in Jerusalem (founded 1882), among whose essential functions is research on trachoma; the St. John Ambulance Association (founded 1878), the teaching body of the order, which compiles first-aid manuals, conducts courses of instruction, and issues first-aid certificates; the St. John Ambulance Brigade (founded 1888), whose unpaid members of both sexes give voluntary service throughout the Commonwealth at public gatherings and which works in conjunction with the British Red Cross Society. The St. John Cadet Divisions, composed of younger persons, have become a leading British youth organization.

The order's headquarters (including its library and museum) are at St. John's Gate, Clerkenwell, London, on the site of the original English grand priory. The venerable order has a small share in the ancient commandery of Kolossi in Cyprus. It accredits liaison officers to the Sovereign Military Order in Rome, the German Johanniterorden and its Swiss Association, and the orders of St. John in the Netherlands and Sweden.

In Northern Europe.—The core of the ancient Langue of Germany was the bailiwick of Brandenburg. At the Reformation the bailiwick became Lutheran without, however, severing all relations with the grand master in Malta. Well endowed, it was active in philanthropic work until the Napoleonic Wars, when its property was confiscated by Prussia. In 1852 it was reestablished with its old name, Johanniterorden, by Frederick William IV of Prussia, who entrusted to it the task of maintaining existing hospitals and creating new ones in Prussia, with funds to be found by the knights themselves. Its head, called the *Herrenmeister*, is elected by the chapter and has generally been a member of the Prussian royal house. Membership is confined to Protestants and to noblemen, although the rule regarding nobility was slightly relaxed after World War II. After World War I the Johanniterorden lost the greater part of its funds through successive inflations and deflations, and then suffered further from the active hostility of the Hitler regime. After World War II it lost its headquarters and most of its hospitals, which lay in East Germany and Poland. Its headquarters were transferred to Rolandseck in the Rhineland, and it has rebuilt its hospital work in the German Federal Republic.

Three national associations (*Genossenschaften*) have remained under the jurisdiction of the *Herrenmeister:* those of Hungary, Sweden, and Finland. The Swedish and Dutch commanderies separated themselves from the Johanniterorden in 1920 and 1945, respectively, to become independent orders. In 1958 a series of conferences between the British, German, Dutch, and Swedish orders and the three associations on matters of common interest was inaugurated in the castle of Bubikon, near Zürich, an important Swiss commandery of the order in the Middle Ages.

BIBLIOGRAPHY.—Chief source is the archives in the Royal Malta Library, Valletta. Other collections of manuscripts are in the Vatican Library; the Palazzo Malta, Rome; and the library of the order at Clerkenwell, London. Chief published sources are ed. by J. Delaville le Roulx, *Cartulaire général des Hospitaliers de Saint-Jean de Jérusalem, 1100–1310,* 4 vol. (1894–1906); *see* also his *Les Hospitaliers en terre sainte et à Chypre, 1100–1310* (1904); E. J. SAINT JOHN PERSE: *see* PERSE, SAINT JOHN.

SAINT JOHN RIVER, the largest river in New Brunswick, Can., discovered by De Monts and Champlain in 1604 and named after St. John the Baptist. It is 418 mi. long and drains a basin of 21,600 sq.mi., of which 14,000 are in the provinces of New Brunswick and Quebec, and the remainder in the state of Maine. The river rises in northwestern Maine and flows northeasterly to the New Brunswick border, whence it gradually turns southeastward and for 80 mi. forms the international boundary. Just above Grand Falls the river enters Canada and flows through New Brunswick into the Bay of Fundy at Saint John. The lower 81 mi. are tidal and navigable for large steamers as far as Fredericton. There are hydroelectric power developments at Grand Falls and Beechwood on the St. John, as well as on its tributaries, the Tobique, Aroostook, and Madawaska rivers. (C. W. RD.)

SAINT JOHN'S, the provincial capital of Newfoundland, Can., lies on the east coast of the island and is the most easterly city of the North American continent. The city's population in 1961 was 63,633 and that of the metropolitan area was 90,838. The people of St. John's are almost entirely of Irish and English origin. Nearly half are adherents of the Roman Catholic Church and the remainder belong to several Protestant churches, chiefly the Anglican and the United Church of Canada.

The city stands on the steep, western slope of its excellent landlocked harbour which opens suddenly in the lofty coast. The entrance, known as The Narrows, guarded by Signal hill (500 ft.) and South Side hills (620 ft.), is about 1,400 ft. wide, narrowing to 600 ft. between Pancake and Chain rocks.

At an early date the harbour of St. John's was recognized as one of the most outstanding in this part of North America and was used as a haven for fishing vessels. The earliest allusion to the name St. John's (from St. John the Baptist) was in a letter written in 1527 by an English ship captain who mentioned that he had stopped at the harbour and found Norman, Breton, and Portuguese ships anchored there. In early years settlement was discouraged by the English government in order to protect the fishery for the exploitation of the home fishermen (*see* NEWFOUNDLAND: *History*) and permanent settlement was not established until the beginning of the 17th century. In spite of this delay, St. John's is one of the oldest cities in North America. During its history frequent conflagrations swept through the town, destroying extensive areas.

St. John's occupies a most important position in the economic and cultural life of the province. Within the economic structure of Newfoundland the city is outstanding in retail and wholesale trade and is important also in service trade and performs a prominent role in transportation. Its substantial and varied commodity exchanges in the shipping trade are especially noteworthy. It is the major terminal point for rail, highway, and air transportation systems. (C. N. F.)

SAINT-JOHN'S-WORT, any low, shrubby plant of the genus *Hypericum* of the St.-John's-wort family (Hypericaceae), having usually yellow flowers, and opposite, often stalkless leaves that are dotted with transparent glands. Of over 300 species, widely distributed in temperate and tropical regions, more than 40 are found in the United States, chiefly in the eastern part. Among them are some cultivated for their showy flowers: *H. frondosum* (*aureum*), *H. densiflorum,* and *H. prolificum,* all from the eastern and southeastern states.

Over 50 species, mostly of Eurasian origin, are cultivated in British gardens, especially *H. perforatum* and the tutsan (*H. androsaemum*), both once widely used in medicine. Aaron's-beard, the rose of Sharon (*H. calycinum*) from the Mediterranean region, is naturalized in Great Britain and has evergreen leaves and very showy yellow flowers. Mostly perennials, all are easily grown from seed in any ordinary garden soil, preferably in a shady situation; in the U.S. many species are hardy north to New York and New England. (N. TR.)

SAINT JOSEPH, a city of southwestern Michigan, U.S., and seat of Berrien County, is situated on Lake Michigan at the mouth of the St. Joseph River about 60 mi. across the lake northeast of Chicago. In the 1670s both Father Jacques Marquette and René Robert Cavelier, Sieur de La Salle, visited the region; later the river's mouth became the site of a French military and trading post because of its strategic location. In the early 19th century the soil and climatic conditions of the area attracted settlers from New England and New York who early turned to fruit and grape cultivation. St. Joseph was incorporated as a village in 1834; its eastern portion gained incorporation as Benton Harbor (*q.v.*) in 1869; and in 1891 both communities received separate city charters. The two cities, connected by a wide thoroughfare and a ship canal, are integrated economically and culturally and are virtually a unit. In the mid-19th century St. Joseph's importance as a port city was curtailed by expanding midwestern railroad facilities. From that time it has continued to serve as a regional marketing centre for fruit growers, a resort with beaches and mineral springs, and an industrial centre specializing in canning and in manufacturing automotive parts, castings, and rubber goods. For comparative population figures *see* table in MICHIGAN: *Population.* (E. O. E.)

SAINT JOSEPH, a city of northwestern Missouri, U.S., on the east bank of the Missouri River, 55 mi. NW of Kansas City; the seat of Buchanan County. Rich in historical tradition, St. Joseph is known as the city "where Southern hospitality meets Western democracy." A post was established there in 1826 by Joseph Robidoux, a French-Canadian trapper from St. Louis. The site was regarded as a sacred area by local Indians, who called the river "road to paradise" and the high bluffs above "Blacksnake Hills." In 1836, by the Platte Purchase, the Sac, Fox, and Iowa tribes surrendered their lands and six counties were added to northwestern Missouri; subsequently there was an influx of white settlers. Robidoux laid out the town in 1843 and named it after his patron saint; it was made the county seat in 1846 and was chartered as a city in 1851. With the coming of the railroad era, complementing the already thriving steamboat traffic, St. Joseph appeared destined to become the metropolis of the trans-Mississippi West. In 1859 the Hannibal-St. Joseph, a landgrant railroad, was completed and in April 1860, it delivered the first mail pouch to the rider who launched the brief but spectacular history of the Pony Express (*q.v.*).

St. Joseph boomed as a major outfitting centre for emigrants headed for the gold fields of California and other points on the Pacific coast. Before and during the American Civil War the frontier town was on the fringe of the bloody guerrilla warfare in Kansas and Missouri and was visited by such border outlaws as W. C. Quantrill and Jesse James, who was killed in his home there in 1882. Between 1860 and 1900 St. Joseph enjoyed its greatest period of expansion but was eclipsed by Omaha, Neb., and Kansas City when transcontinental railroads passed it by. In the mid-20th century the city again grew fairly rapidly, partly by annexation (for comparative population figures *see* table in MISSOURI: *Population*). The population of the city in 1960 was 79,673 and of the standard metropolitan statistical area (Buchanan County) 90,581. Corn, tobacco, blue grass, small grains, livestock, and fruit are produced and marketed there. Major industries include meatpacking, milling, cereal and dairy products, clothing, foundry, machine-shop and electrical products, and wholesale distribution. The state mental hospital is in St. Joseph. (Jo. L. H.)

SAINT JOSEPH RIVER, the name of two rivers in the United States, both of which rise in south-central Michigan. The larger of the two flows generally westward for 210 mi. to empty into Lake Michigan at a point between Benton Harbor and St. Joseph, Mich. Midway in its course it swings southward into northern Indiana past the cities of Elkhart and South Bend. At Elkhart the average flow is 3,350 cu.ft. per sec. The maximum rate of flow, an average of 9,380 cu.ft. per sec., comes in February; the minimum flow, 620 cu.ft. per sec., in September. The St. Joseph has been dammed at Union City, Mich., for waterpower development. The river is also an important source of urban and industrial water supply.

The other St. Joseph River flows southward over 100 mi. through Michigan, Ohio, and Indiana to join the St. Marys River. The two form the Maumee River at Fort Wayne, Ind.; the Maumee in turn flows northeastward to empty into Lake Erie at Toledo. Except for Fort Wayne, there are no large cities in the St. Joseph basin. (R. R. D.)

SAINT JOSSE-TEN-NOODE (Flemish SINT-JOOST-TEN-NODE), a northeastern commune of Brussels (*q.v.*), Belg. Pop. (1961) 24,463. In the mid-19th century it changed from a rural area to a residential and commercial suburb of Brussels. The Botanical Gardens date from 1826 and the Charlier Museum was a patrician residence, bequeathed with its contents to the commune. The dukes of Burgundy had a castle there and royal processions entered the capital through the village. Charles Rogier (*q.v.*) lived there for 50 years and Charles de Bériot from 1841–68. It is a centre of the Belgian film industry. (Y. E. D. J.)

SAINT-JUST, LOUIS ANTOINE LÉON (1767–1794), French revolutionary, famous for his inflammatory speeches in the National Convention and for his rallying of the French Army by

his missions, was born at Decize in the Nivernais on Aug. 25, 1767, the son of a cavalry captain. He studied at the College of the Oratorians at Soissons and later became a clerk to the public prosecutor of Soissons, completing his legal studies at the University of Reims in 1788. In May 1789 he published anonymously his romantic epic poem *Organt,* in which he satirized the *ancien régime.*

He was in Paris at the fall of the Bastille (*see* FRANCE: *History;* FRENCH REVOLUTION) and then was prominent in the politics of his home town, Blérancourt, near Soissons, becoming secretary to the municipality. Lieutenant colonel of the local national guard, he represented it at the Fête de la Fédération in Paris on July 14, 1790. He first expressed his admiration for Maximilien Robespierre (*q.v.*), with whom he was later closely associated, in a letter to Robespierre in August 1790.

Although elected, he was too young to sit in the Legislative Assembly, but on Sept. 5, 1792, he was elected as deputy for the Aisne to the National Convention; his maiden speech on Nov. 13 began his meteoric career. His speeches at the trial of Louis XVI (December 1792–January 1793) helped to defeat the demand for a plebiscite on the death sentence and for the postponement of the execution. In March he went to the Aisne and to the Ardennes to supervise recruiting for the war. On his return he opposed in the Convention and in the Jacobin Club the draft constitution proposed by the Girondins (*q.v.*) and advocated a legislature elected by universal suffrage and with absolute power over the executive. After the Girondin leaders had been arrested in the Convention on June 2, 1793, Saint-Just made a violent attack on them in his report of July 8, as spokesman for the Committee of Public Safety, which he had joined on May 30.

On Oct. 10 he published his report stating that the government would remain revolutionary until peace was made. He was sent on Oct. 22 to the Army of the Rhine with Philippe Lebas, whose sister Henriette was Saint-Just's fiancée for a time, and he restored the morale of the troops and provided them with food and clothing. He imposed a forced loan on the rich of Strasbourg and Nancy, distributed relief to the poor, replaced the civic authorities, and brought to justice the extremists, including Johann (Euloge) Schneider, the public prosecutor of the Strasbourg revolutionary tribunal. These rigorous measures won him the support of the *sans-culottes* and contributed to the successes of the Army: the relief of Bitche and Landau (December) made the eastern frontier secure.

On 3 Pluviôse, year II (Jan. 22, 1794), he went on a mission to the Army of the North and on 1 Ventôse (Feb. 19) was elected president of the Convention. In his report of 8 Ventôse he justified the revolutionary government and the Terror, and the Convention adopted his proposals for the confiscation of suspects' property and for its distribution to the poor. During March 1794 Saint-Just supported Robespierre's attack on Jacques Hébert (*q.v.*) and took the leading role in the conviction of Georges Danton (*q.v.*). The decree of 27 Germinal (April 16), by which all those accused of conspiring against the republic were to be brought to the revolutionary tribunal at Paris, was also his work.

Again sent to the Army of the North, he led the attack at the victory of Fleurus. He was thought to have wanted to end the Terror, but as he was in Paris when the law of 22 Prairial (June 10) was drawn up, streamlining the revolutionary tribunal, he almost certainly approved of it and he gave continuous support to Robespierre during the crisis of Thermidor. The Convention decreed his arrest on 9 Thermidor (July 27, 1794), when he was prevented from making his prepared speech; after escaping he was captured in the Hôtel de Ville the next day and was guillotined on the Place de la Révolution (now the Place de la Concorde). His complete works, edited by C. Vellay, were published in two volumes in 1908, and his *Discours et rapports,* edited by A. Soboul, in 1957.

SAINT KILDA, the collective name for a group of seven islands and stacks lying 45 mi. W of Griminish Point, North Uist, Outer Hebrides, Inverness County, Scot. The largest island, Hirta, is 1,575 ac. (637 ha.), 3 mi. by 2 mi. rising to 1,397 ft. (426 m.). The cliffs are precipitous, of gabbro and allied rocks, and rise from deep water except at the southeast landing place. The group escaped glaciation and constitutes the most spectacular cliff scenery in Britain. Soay, 244 ac., reaches 1,225 ft.; Boreray, 189 ac., 1,245 ft.; Dun, 79 ac., 576 ft.; Stac an Armin, 13 ac., 627 ft.; Stac Lee, 6 ac., 544 ft.; and Levenish, 1 ac., 185 ft. It is the premier seabird station of Britain with the largest gannetry in the world. Subspecies of wren and long-tailed field mouse have evolved on St. Kilda, and the Soay sheep, formerly thought to be of Viking origin but almost certainly older, is of Mouflon type. There are many sites of archaeological interest. Once a possession of the Macleods of Dunvegan, St. Kilda was bought by the Marquis of Bute after evacuation of the Gaelic-speaking population (36) in 1930. The group now belongs to the National Trust for Scotland and is kept as a National Nature Reserve. Hirta has had a small military garrison since 1957, manning a radar station. (F. F. DG.)

SAINT KITTS-NEVIS (SAINT CHRISTOPHER-NEVIS), a territory consisting of the three Caribbean islands St. Kitts (or St. Christopher), Nevis, and Anguilla, which formerly composed a presidency of the Leeward Islands Federation and from 1958 to 1962 a territory of the West Indies Federation. Area 138 sq.mi. (357 sq.km.) including the islet of Sombrero. Pop. (1960): St. Kitts, 38,291; Nevis, 12,762; Anguilla, 5,605; total, 56,658. The population is almost entirely Negro. The capital is Basseterre on St. Kitts.

St. Kitts is a long, narrow island with an area of 68 sq.mi. (176 sq.km.). It is well watered, fertile, and has a cool, healthful climate, drier than most West Indian islands. Temperatures vary from 78° to 85° F (25.6° to 29.4° C); annual rainfall is 38 in. (965 mm.). The island has a mountainous backbone of volcanic origin (Mt. Misery, 3,711 ft. [1,131 m.]). The narrow coastal plain, the skirts of the mountains, and the Basseterre valley are devoted to the cultivation of sugarcane and cotton. Basseterre (pop. 15,579) on the southwest coast is the only port; Golden Rock Airport nearby provides services to other Caribbean islands and New York City. Most of the working population is employed on the sugar estates or in the sugar refinery at Basseterre.

To the southeast Nevis, also volcanic, separated from St. Kitts by a narrow channel, is almost circular and has a conical appearance (Nevis Peak, 3,596 ft. [1,096 m.]). Its area is 36 sq.mi. (93 sq.km.) and its population includes many small farmers. The chief crop is cotton, but some sugarcane is also grown. Charlestown, on the southwest coast, is the chief town and port, and an airfield provides services to other islands.

Anguilla, about 60 mi. (95 km.) NNW of St. Kitts, is a bare, flat island of Oligocene limestone and clay, with an area of 35 sq.mi. (91 sq.km.). Most of the farmers own their land. Stock raising, salt production, and fishing are the main industries, and Anguilla-built sloops are highly esteemed. There are two villages and an airstrip.

There are about 45 primary and 5 secondary schools, mostly government-operated, on the islands. Health facilities include 2 general hospitals and about 25 health centres. The principal exports are sugar, molasses, and cotton.

The islands were discovered and named by Christopher Columbus in 1493, and were colonized by the English in the 17th century. Sir Thomas Warner made the first English settlement in the West Indies on St. Kitts in 1623, and the indigenous Caribs were driven out in 1629. Divided for a time between the French and the English, the island was finally ceded to Britain in 1783. The great fortress on Brimstone Hill is an impressive example of British military architecture. (R. TO.)

SAINT LAURENT, LOUIS STEPHEN (1882–), Canadian statesman and Liberal prime minister (1948–57), was born on Feb. 1, 1882, at Compton, Que. He studied at St. Charles College, Sherbrooke, and at Laval University, Quebec. He was called to the bar at Quebec in 1905 and became one of Canada's leading lawyers, serving two terms as president of the Canadian Bar Association. On Dec. 10, 1941, he entered federal politics as minister

of justice, succeeding Ernest Lapointe, leading representative of French-speaking Canadians in the Mackenzie King administration.

In the face of widespread opposition in French-speaking Canada, St. Laurent defended the government's limited use of military conscription in 1944. By his forthright attitude, he maintained Quebec's place in the wartime government and thereby avoided a serious split within the Canadian population. In the election of June 1945, his position was overwhelmingly endorsed by the electorate of his province. He took a leading part at the San Francisco conference (1945) that created the United Nations, and in 1946 became Canada's secretary of state for external affairs.

Despite a personal preference to return to his law practice, St. Laurent was persuaded to accept the leadership of the Liberal Party in August 1948, and succeeded Mackenzie King as prime minister on Nov. 15, 1948. He was one of the main architects of the North Atlantic Treaty Organization (*q.v.*). His government gave instant and substantial military support to the United Nations intervention in Korea in 1950. The St. Laurent government declined to support the British and French intervention at Suez in 1956, but took a leading part in establishing the United Nations emergency force to restore peace and order there. A firm believer in the Commonwealth of Nations, St. Laurent's influence contributed greatly to keeping India and Pakistan within that voluntary association of free nations. His bold initiative removed the obstacles to the joint construction of the St. Lawrence Seaway by Canada and the United States.

By the union of Newfoundland with Canada in 1949, the St. Laurent government completed the grand design of the fathers of confederation. His government was responsible for giving final jurisdiction to the Supreme Court of Canada, thereby ending appeals to the judicial committee of the United Kingdom Privy Council. He strengthened the unity and fostered the development of the Canadian nation by instituting measures for the equalization of provincial revenues, enlarged social security, grants to universities, and the establishment of the Canada council for the promotion of arts and letters.

After winning overwhelming victories in the 1949 and 1953 elections, the St. Laurent government was defeated by a narrow majority on June 10, 1957. He served as leader of the opposition until a national Liberal convention chose Lester B. Pearson to succeed him as Liberal leader in January 1958. He then retired from public life and resumed his law practice in the city of Quebec.

(D. C. T.)

SAINT-LAURENT, a suburban city of Quebec, Can., on the northwest side of Montreal Island; part of the Montreal metropolitan area. Industries include the manufacture of aircraft, railway cars, foundry products, chemicals, and textiles. Pop. (1961) 49,805. Founded in 1845 on the site of a mission which dated back to 1720, the village of Saint-Laurent became a town in 1893 and was incorporated as a city in 1955. In 1952, in an exchange with Montreal, Saint-Laurent ceded part of its eastern section to the larger city.

In 1954, after residential developments had nearly filled the available land, Saint-Laurent city annexed Saint-Laurent parish, thus quadrupling its area. (M. C. Ba.)

SAINT LAWRENCE RIVER, the greatest North American river draining to the Atlantic coast. At its head is the Great Lakes basin which has a land and water area of about 291,900 sq.mi. (756,000 sq.km.) and discharges into the St. Lawrence an average yearly volume of 239,500 cu.ft. per sec. The tremendous storage capacity of the Great Lakes stabilizes the supply of water contributed to the river to an unusual extent; the maximum and minimum mean monthly outflow of the lakes since 1860 has ranged from 315,000 cu.ft. per sec. (May 1870) down to 154,000 cu.ft. per sec. (February 1936). This maximum-minimum ratio of about 2 to 1 makes the St. Lawrence one of the world's most dependable rivers.

While the St. Lawrence drainage area extends as far as the headwaters of the St. Louis River, a stream which flows into Lake Superior at its western extremity (Duluth, Minn.), the St. Lawrence River has its head at the eastern end of Lake Ontario. The river thus becomes the connecting link between the Great Lakes basin and the Atlantic Ocean. It has, however, a number of major rivers which are direct tributaries—the Ottawa, Saint-Maurice, Saguenay, and Richelieu (draining Lake Champlain). The drainage area in Canada, excluding the Great Lakes section, is estimated by official sources as 198,000 sq.mi. (513,000 sq.km.).

In determining the length of the St. Lawrence River the figure arrived at depends upon the locality taken as the mouth. On many official maps and in the U.S. Navy's *Sailing Directions for the Gulf and River St. Lawrence,* it is extended as far seaward as the eastern part of the Gaspé Peninsula, where the west end of Anticosti Island serves as the transition point between the river and Gulf of St. Lawrence. From northern to southern shore is about 70 mi., and the distance to Lake Ontario at Kingston, Ont., is 725 statute miles. A more restrictive definition, one which is preferred in geographical terms, places the mouth between Pointe des Monts and Cap Chat on the northern and southern shores, respectively. This locality is about 595 mi. downstream from Lake Ontario. There the river is 25 mi. wide; seaward from this point the width increases rapidly as the left shore turns abruptly northward.

The St. Lawrence was discovered in 1535 when Jacques Cartier, a French explorer, entered what is now known as the Gulf of St. Lawrence via the Strait of Belle Isle. On Aug. 10, feast day of St. Lawrence (a Christian martyr who died Aug. 10, 258), Cartier discovered a bay on the mainland north of Anticosti Island, which he named for the saint. Noting the current in the strait which now bears his name, Cartier continued westward up the river until he reached the present site of Montreal. He referred to the river as the River of Canada but through usage it gradually became the St. Lawrence. No settlement was established along the river until 1599, when Pierre Chauvin settled Tadoussac at the mouth of the Saguenay. In 1608 Samuel de Champlain laid the foundation for Quebec, the first permanent settlement.

The St. Lawrence is one of the principal routes through the highlands of eastern North America and its course is the focal centre of one of Canada's most important economic and culture areas—the St. Lawrence lowlands. This area lies between the Laurentian Upland or Canadian Shield to the north and Appalachian Highlands and Adirondack Mountains on the south. It extends from Quebec city westward to the vicinity of the Thousand Islands near the head of the river. These islands mark the zone where the Precambrian rocks of the Canadian Shield extend south of the St. Lawrence and form the Adirondacks in New York State. About midway on the long axis of the lowland is Montreal; here the width of the lowland is about 70 mi. The area is underlain by sedimentary rocks—limestone, shale, and sandstone—in contrast to the older, harder rocks of the adjacent highlands. Following the retreat of the continental ice sheet of the Pleistocene period, the sea invaded the lowland and formed the Champlain Sea. Marine sediments deposited during this period of inundation produced deep, fertile soils over the lower levels of the lowland. The soil materials in the higher sections are of glacial origin including fluvioglacial outwash.

For purposes of analysis the St. Lawrence and its borderlands divide conveniently into three segments: the upper river (above Montreal), the middle river (Montreal to Quebec), and the lower river (the estuary).

The Upper River.—This section extends 182 mi. (293 km.) from Kingston, at the outlet of Lake Ontario, to Montreal. From its head to a point where it crosses the 45° parallel N, a distance of 114 mi., the St. Lawrence forms the boundary between the United States and Canada (New York State and the province of Ontario). The remainder of its course to the sea lies wholly in Canada. A former system of 14-ft. navigation canals and the present 27-ft. seaway, constructed to avoid the series of rapids in the river, are located entirely within this upper segment of the St. Lawrence. At Lake Ontario the surface elevation of the river is about 245 ft. (75 m.) above sea level and at Montreal it is about 20 ft. The international power dam and two control dams constructed in connection with the seaway development have eliminated some of the upper rapids, including the well-known Long Sault Rapids, and in their place is a broad man-made water body of about 100

sq.mi. (260 sq.km.) named Lake St. Lawrence. In the construction of this lake about 38,000 ac. (15,000 ha.) of land were inundated, and it was necessary to relocate several river-front communities. Flooding of the area began on July 1, 1958, and the new level was achieved within several days.

Downstream from Lake St. Lawrence and above Montreal the river broadens in two areas to form Lake St. Francis, about 28 mi. (45 km.) long, and Lake St. Louis, about 15 mi. long. To utilize the hydroelectric power potential resulting from a difference of about 82 ft. (25 m.) in the water level of these two lakes, a power canal 15 mi. long was completed in 1932. It later became part of the St. Lawrence Seaway (*q.v.*).

At the head of Lake St. Louis is the confluence of the Ottawa River, a stream which served as an outlet to the sea for the post-glacial upper Great Lakes before rise of land to the north diverted their discharge to Lake Erie and to the present upper course of the St. Lawrence. Part of the Ottawa's flow discharges into the St. Lawrence below Montreal and thus forms an island on which the city of Montreal is located. In the St. Lawrence River at Montreal, about 500 ac. (200 ha.) of additional island area was created to provide space for the city's 1967 world's fair.

The Middle River.—Montreal developed at the head of navigation on the St. Lawrence—the point where further progress upstream was blocked by the Lachine Rapids. Completion of the St. Lawrence canals in the 1800s and the seaway in 1959 permitted small and medium-sized ocean vessels to continue past Montreal but the port remains the terminal point for the larger merchant ships of the world. A ship channel 35 ft. (11 m.) in depth extends from Montreal to a point 40 mi. below Quebec city. Of the 200 mi. (320 km.) of the middle river, about 113 mi. is dredged canal. Montreal is one of the great seaports of the world and is accessible for ocean vessels for about 8½ months of the year; overseas ships reinforced for ice navigation initiated winter service in January 1964.

From Montreal to Quebec, a distance of 160 mi. (256 km.), the St. Lawrence has a low gradient and a mean width of more than a mile. In the harbour of Montreal the elevation is 20 ft. (6 m.); about midway to Quebec, at Trois-Rivières (Three Rivers), mean sea level is reached. Trois-Rivières hence becomes the upstream limit of tidal conditions. About 45 mi. downstream from Montreal is the port of Sorel, at the mouth of the Richelieu River and at the head of Lake St. Peter. The Richelieu-Lake Champlain route provides a shallow-draft waterway which connects with the Hudson River. In the large impounded section of the St. Lawrence called Lake St. Peter the river widens to more than 8 mi. (13 km.) but has a natural depth of only about 11 ft. (3 m.). At the head of the lake, near Sorel, is a delta with many islands formed from river deposits.

Trois-Rivières, about 77 mi. (124 km.) above Quebec, is at the mouth of the Saint-Maurice River. This river valley is Canada's leading pulp- and paper-producing region, and Trois-Rivières is the capital of this industry. By the 1950s this ocean port handled more traffic than Quebec. Below Trois-Rivières the St. Lawrence follows an irregular course and narrows to less than ¾ mi. at Quebec bridge, about 7 mi. upstream from the city, and between Quebec and Levis. Because of the narrowness of the river, the ebb current has a velocity up to 5.8 knots and the flood current 4.7 knots.

The Lower River.—At the head of the estuary section of the St. Lawrence stands the city of Quebec. In the language of the Algonkian Indians its name means "where the river narrows." The city, which is the capital of Canada's largest province, is divided into an Upper Town and Lower Town by steep cliffs, and commanding a site 340 ft. (104 m.) high is the famous old fortress named the Citadel.

Tidal action is increased in the long funnel-shaped estuary, with the result that spring tides in Quebec Harbour rise from 16 ft. to 19 ft. (5 m. to 6 m.) and neap tides about 13 ft. The regular navigation season of eight to nine months has been supplemented since 1959 by all-winter ocean vessel service. The length of the estuary to Pointe des Monts is 253 statute mi. (407 km.); to Anticosti Island is an additional 130 mi. St. Paul Island in Cabot Strait is 620 statute (538 nautical) mi. from Quebec.

Below Quebec the St. Lawrence has a littoral lowland which is more extensive on the south shore, with a resulting greater population and agricultural development than on the narrow, discontinuous lowland on the opposite shore. The Island of Orleans, near the head of the estuary, narrows the river into two channels, the main one lying to the south of the island. Waters of the St. Lawrence are considered fresh to the lower end of this island. At Les Escoumins, on the north shore and about 150 mi. (241 km.) below Quebec, is the pilotage station for the St. Lawrence River. Pilotage is optional but payment of the fee is compulsory.

Along the north shore of the lower estuary several significant commercial ports have been developed. Baie Comeau, a producer of paper and aluminum, has become an important transshipping point for U.S. and Canadian export grains since operation of a huge elevator started in 1961. To the northeast, on Sept-Iles Bay, the first of three ports for shipping iron ore from the vast Quebec-Labrador deposits opened in 1954. This was Sept-Iles (Seven Islands), the terminus of a railroad extending 360 mi. (579 km.) northward. Port Cartier, another iron ore port about 40 mi. to the west, opened in 1961. The third ore port was Pointe Noire, on the west shore of Sept-Iles Bay, which began operations in 1965. The St. Lawrence Seaway has played a vital role in enhancing the competitive position of Canadian ores for steel plants in the Great Lakes area.

The fisheries of the St. Lawrence are of relatively minor importance compared with those of the Maritime Provinces and Newfoundland. Nevertheless, the river and estuary remain well known for several saltwater species which frequent these waters at certain periods of the year. Sea sturgeon abound in the estuary; there is intensive commercial fishing from the Island of Orleans to Rivière du Loup. Atlantic salmon spawn in the many tributaries of the St. Lawrence seaward of Île aux Coudres. The American eel (*Anguilla rostrata*) is among the most important species caught in the fresh or brackish waters of the river. Other prominent species in the lower river and estuary are catfish, cod, herring, and smelt.

The St. Lawrence has two major hydroelectric power developments in its upper course. The Beauharnois Dam has an installed capacity of 2,145,000 hp. The international power dam, constructed jointly by the state of New York and province of Ontario concurrently with the seaway development, has an installed capacity of 2,472,000 hp.

SAINT LAWRENCE SEAWAY, a major improvement of the St. Lawrence Waterway which made a highly important interior section of North America accessible for the first time to deep-draft, oceangoing vessels, and also permitted the large Great Lakes freighters to extend their range of operations to the ports on the lower St. Lawrence. The waterway was completed for the opening of the navigation season on the St. Lawrence River and Great Lakes in April 1959 and was dedicated June 26, 1959.

The project which brought about this development was a joint undertaking of the governments of the United States and Canada to provide 27-ft. (8-m.) navigation channels between Montreal and Lake Erie. A related United States project, which required widening and deepening of the connecting channels of the Great Lakes (the Detroit, St. Clair, and St. Marys rivers) to make them commensurate in depth with those of the seaway, was essentially completed in 1964.

Strictly speaking, the seaway is the St. Lawrence River portion of the waterway, but the Welland Ship Canal was officially incorporated into the project through legislation, and improvements were made in it as a part of the total seaway undertaking. However, the broader concept of the "seaway," and one which is in

general usage, includes the entire system of lakes, locks, canals, and rivers which have converted over 6,600 mi. (10,621 km.) of mainland Great Lakes shore line of the United States and Canada into another seacoast.

History of Navigation on the St. Lawrence. Since 1535, when the explorer Jacques Cartier was turned back from his quest for the Northwest Passage by the Lachine Rapids of the St. Lawrence, men have made plans and built works to provide a through waterway from the Atlantic to the "inland seas."

Segments of the pre-seaway canal system were begun in the early 1700s. After union of the provinces of Upper and Lower Canada in 1841, work was undertaken to deepen all of the canals along the St. Lawrence route to 9 ft. (3 m.) and the project was completed in 1848. Following the Acts of Confederation in 1867 the Canadian government decided upon a program for the improvement of the canal system to a depth of 14 ft., with locks to be 270 ft. by 45 ft. The enlargement and deepening was carried out in stages, and the canal system was opened for traffic in 1901, although some work was not completed until 1913. Improvement of the Welland Canal, a 27-mi. (43-km.) waterway built to overcome the 326-ft. (99-m.) difference in the levels of Lakes Erie and Ontario, was carried out concurrently with work on the St. Lawrence canals and a 14-ft. (4-m.) channel was completed in 1887. The Welland Ship Canal (*q.v.*), completed in 1932, was built with a controlling depth of 25 ft. (8 m.); it included eight locks which had dimensions equal to those subsequently built as a part of the seaway project.

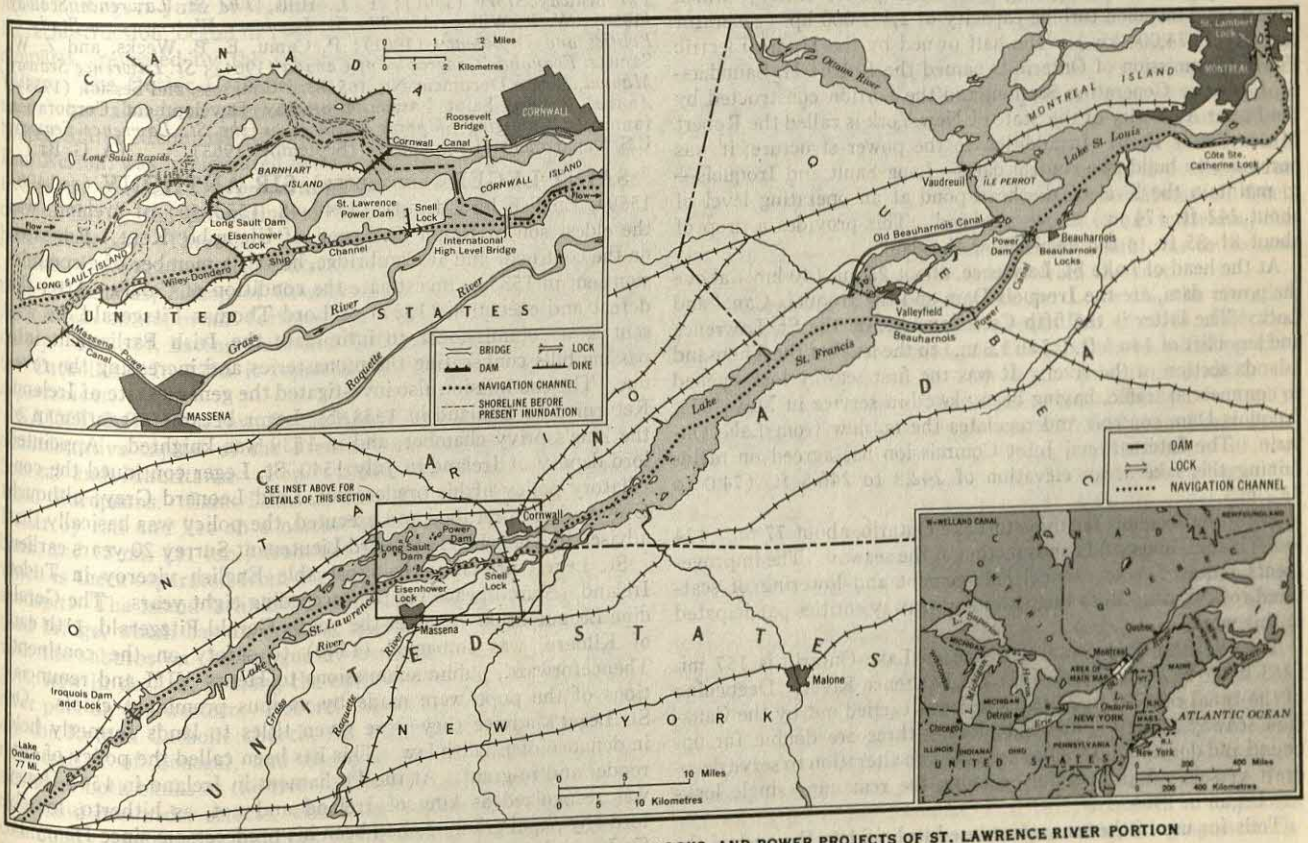
The 14-ft. St. Lawrence canals system as it existed for over a half century prior to the seaway was entirely a Canadian facility. To overcome the obstacles to navigation in the 112-mi. (180-km.) section of the river between Montreal and the head of the Galops Rapids, a series of six canals was built along the north shore to bypass eight rapids. The canal segments totaled 47 mi. (76 km.) in length, and 21 locks accounted for a total lift of 209 ft. (64 m.) of the 225-ft. (69-m.) difference in river levels between Montreal and Lake Ontario. The maximum lift of any single lock was 23.5 ft. Lock dimensions varied slightly, the smallest, and hence the controlling lock for ship dimensions, being 43 ft. 8 in. wide and 270 ft. long, with a depth over the lock sills restricting the draft to 14 ft. The maximum overall length for a vessel using this lock was 259 ft. The maximum cargo which could be carried through this canal system was about 1,600 tons for ocean vessels and about 2,800 tons for "canallers," vessels especially designed for transporting bulk cargo through the canals. Ocean vessels of the size using this waterway could load to their maximum drafts of about 20–21 ft. from Montreal eastward, since the St. Lawrence Ship Channel, with a depth of 35 ft., extended up the river to this port.

International negotiations toward establishing a deep waterway from the sea to the Great Lakes date back at least to 1905 when an International Waterways Commission was created. After lack of U.S. congressional approval prevented international agreements in 1932 and again in 1941, the governments of Canada and of the province of Ontario began to plan for a joint seaway and power project. In 1951 the (Canadian) St. Lawrence Seaway Authority was established. Negotiations followed which resulted in agreement for the joint development of power in the International Rapids section by Ontario and New York State power agencies. Legal obstacles followed, but in June 1954 the U.S. Supreme Court upheld the action of the Federal Power Commission in granting a license to the Power Authority of the State of New York.

Meanwhile, bills were introduced in 1953 in Congress to provide for United States participation in construction of the seaway. Enactment of the Wiley-Dondero Bill in May 1954 created the Saint Lawrence Seaway Development Corporation to construct part of the seaway in United States territory and authorized the agency to issue revenue bonds up to $105,000,000 to finance its activities. In 1957 the amount was increased to $140,000,000. The two public power entities began their joint project in August 1954, and soon thereafter the work of the two seaway authorities was started.

The total cost for construction of the dual-purpose undertaking, which was over $1,000,000,000, marked it as the greatest peacetime task that two nations had ever jointly attempted.

The Present Seaway.—The seaway project in the St. Lawrence River consisted of constructing seven locks, dredging long sections of channel, constructing protective dikes, digging canals, and raising and building bridges. The related power project re-



THE ST. LAWRENCE SEAWAY, SHOWING NAVIGATION CHANNEL, LOCKS, AND POWER PROJECTS OF ST. LAWRENCE RIVER PORTION

quired construction of a power dam and two control dams, and the relocation of several towns, railroads, and highways as a result of flooding areas bordering part of the river course.

Limitations on the maximum size of ships operating through the seaway are imposed by channel depth, lock dimensions, and overhead clearances. The 27-ft. (8 m.) depth restricts vessel drafts to 25.5 ft. for minimum safe clearance. All locks are 800 ft. long and 80 ft. wide and have a 30-ft. depth over the sills. Because of these dimensions, traffic is limited to ships 730 ft. (223 m.) in length with a beam of 75 ft. (23 m.). Minimum clearance for fixed bridges is 120 ft. above water level. The seaway dimensions permit oceangoing vessels with cargo capacities up to 8,000 or 9,000 short tons to enter the Great Lakes and allow the transit of bulk-cargo "lakers" with capacities of 27,000–28,000 tons.

The seaway route from Montreal to the head of Lake St. Francis (76 mi. [122 km.]) is wholly in Canada, and all works were carried out by the Canadian seaway agency. A canal about 16 mi. long leads from Montreal Harbour to Lake St. Louis, and two locks—St. Lambert and Côte Sainte-Catherine—overcome a drop of about 45 ft. (14 m.) in water levels between these two areas. At the head of Lake St. Louis the seaway bypasses the Beauharnois power dam to enter a 16-mi. power canal. Two locks—the Upper and Lower Beauharnois—each have a lift of approximately 40 ft. The power canal, which extends to Lake St. Francis, was completed in 1932 with a navigable depth of 27 ft. in anticipation of the seaway.

The international boundary extends along the St. Lawrence River from the head of Lake St. Francis to Lake Ontario. At the lower end of this section, the seaway route is constructed through United States territory in order to bypass the power dam, a structure divided evenly by the international boundary. The United States navigation works consist of the 10-mi. Wiley-Dondero Ship Channel and two locks—Bertrand H. Snell (lower, 45-ft. [14-m.]) lift and Dwight D. Eisenhower (upper, 40-ft.) lift. These facilities were opened July 4, 1958. The upper end of the ship channel terminates in Lake St. Lawrence. This head pond was created by flooding about 38,000 ac. (15,000 ha.) of land above the power dam.

The major structure in the $600,000,000 power project is a dam with 32 generators (16 belonging to each power entity), which have a total installed turbine capacity of 2,472,000 hp. (generator capacity 1,824,000 kw.). The half owned by the Hydro-Electric Power Commission of Ontario is named the Robert H. Saunders-St. Lawrence Generating Station, and the portion constructed by the Power Authority of the State of New York is called the Robert Moses Power Dam. In addition to the power structure, it was necessary to build two control dams—Long Sault and Iroquois—to maintain the level of the head pond at an operating level of about 242 ft. (74 m.) above sea level. This provides a drop of about 81–85 ft. to the level below the dam.

At the head of Lake St. Lawrence, about 25 mi. (40 km.) above the power dam, are the Iroquois Dam and the Iroquois Canal and Lock. The latter is the fifth Canadian lock on the St. Lawrence and has a lift of 1 to 6 ft. (.3 to 1.8 m.) to the level of the Thousand Islands section of the river. It was the first seaway lock opened to commercial traffic, having been placed in service in May 1958. Iroquois Dam controls and regulates the outflow from Lake Ontario. The International Joint Commission has agreed on maintaining this lake at an elevation of 242.8 to 246.8 ft. (74.0 to 75.2 m.).

From the Iroquois facilities to Lake Ontario, about 77 mi. (124 km.), is the Thousand Islands section of the seaway. The improvements required were channel enlargement and lowering of scattered rock shoals. Both the power and seaway entities participated in this work.

The Welland Ship Canal entrance on Lake Ontario is 157 mi. (253 km.) W of the head of the St. Lawrence River. Deepening of the canal channel to 27 ft. (8 m.) was carried out by the Canadian seaway agency. The eight locks—three are double for upbound and downbound traffic—required no alteration to serve deep-draft vessels. A project for twinning the remaining single locks was begun in 1964.

Tolls for use of the seaway are used to liquidate the cost of the project within a 50-year period as required by legislation. The toll rates established were based on an estimated total cost of $471,000,000 (U.S., $131,000,000; Canada, $340,000,000) at the time the project was completed. The composite toll system is based partly on the gross registered tonnage of the ship and partly on the actual cargo tonnage. The division of the toll revenues for transit between Montreal and Lake Ontario is 71% to Canada and 29% to the United States. All tolls derived from transit of the Welland Ship Canal accrue to Canada. Pleasure craft and passenger vessels also are assessed for transit of any segment.

The seaway's primary economic benefit is to the shipping industry; upon its completion the size of general-cargo and bulk-cargo vessels which could utilize the upper St. Lawrence River route was increased greatly, and this brought about a marked gain in annual cargo tonnage. From a pre-seaway peak of 13,500,000 tons, reached in 1956, the traffic volume of the new facility advanced steadily during the first five years of operation, rising from 20,600,000 (1959) to 39,300,000 tons (1964).

Bulk commodities account for about 90% of the cargo tonnage of the St. Lawrence River section of the seaway, the leading products being iron ore moving westward and grains eastbound. Much of the grain shipped to eastern Canadian ports in lake freighters ultimately is transshipped overseas. Direct commerce between the Great Lakes ports and overseas areas accounts for about one-quarter of the seaway's cargo tonnage.

From some Great Lakes ports the seaway route to western Europe is shorter than the transatlantic routes from the U.S. East Coast, and all of the lake ports are hundreds of miles nearer Europe than are the Gulf Coast ports. Ice conditions limit the navigation season on the seaway to about 240–250 days, from early April to early December.

SAINT LEGER (SENTLEGER), **SIR ANTHONY** (*c.* 1496–1559), English lord deputy (1540–48, 1553–56) of Ireland, was the eldest son of Ralph St. Leger, of Ulcombe, Kent. Educated on the continent and at Cambridge, he was a member of a commission sent in 1535 to investigate the condition of Calais. After the defeat and execution (1537) of Lord Thomas Fitzgerald, he was sent as a commissioner to intimidate the Irish Parliament into passing bills confiscating the monasteries and increasing the revenue. The commission also investigated the general state of Ireland. Returning to England in 1538, St. Leger became a gentleman of the king's privy chamber, and in 1539 was knighted. Appointed lord deputy of Ireland in July 1540, St. Leger continued the conciliatory policy of his predecessor, Lord Leonard Grey; although Grey had been recalled and executed, the policy was basically that advised by Henry VIII to Lord Lieutenant Surrey 20 years earlier.

St. Leger, probably the most able English viceroy in Tudor Ireland, secured peace for the succeeding eight years. The Geraldine League broke up after the young Gerald Fitzgerald, 11th earl of Kildare, was smuggled (1540) to safety on the continent. Thenceforward, public submissions to Henry VIII and renunciations of the pope were made by various prominent chiefs. On St. Leger's advice they were given titles to lands formerly held in defiance of English law. This has been called the policy of surrender and re-grant. At the Parliament in Ireland in 1542 Henry was recognized as king of Ireland and not, as hitherto, merely lord (by papal grant) as had been his predecessors since Henry II. St. Leger, however, like Grey, was the subject of Dublin intrigues,

but accusations against him in 1544 proved unsuccessful.

Early in Edward VI's reign St. Leger was recalled, his moderate policy being abandoned for one of aggression. But this rough policy's shortsightedness became evident and he was again restored for the last years of the reign of Edward VI and the first of Mary I. His moderating influence was successful but Mary then appointed as deputy Thomas Radcliffe, Viscount Fitzwalter (later earl of Sussex), with orders to reconcile Ireland with Rome, drive the Scots from Ulster, and plant military colonies in Leix and Offaly. St. Leger probably had little sympathy with the old faith or the new policy. After his recall he was accused of being accessory to alleged financial defalcations by the former vice-treasurer, Sir William Brabazon, but he died at Ulcombe on March 16, 1559, before the investigations were completed. (R. D. Es.)

SAINT LEONARDS, EDWARD BURTENSHAW SUGDEN, 1ST BARON (1781–1875), lord chancellor of Great Britain, was born on Feb. 12, 1781, the son of a hairdresser of Duke Street, Westminster. After practising for some years as a conveyancer, he was called to the bar by Lincoln's Inn in 1807, having already published his well-known *Practical Treatise of the Law of Vendors and Purchasers of Estates* (14th edition, 1862). His parliamentary career was notable for his opposition to the Reform Bill of 1832. He was appointed solicitor general in 1829, and was lord chancellor of Ireland in 1835 and again from 1841 to 1846. Under Lord Derby's first administration in 1852 he became lord chancellor as Lord St. Leonards. He devoted himself with energy and vigour to the reform of the law; in 1855 he was offered the great seal again, but had to refuse. He was learned and lucid, though inclined to be waspish and overbearing. He died at Thames Ditton on Jan. 20, 1875. He was the author of various important legal publications, many of which passed through several editions.

See J. B. Atlay, *Lives of the Victorian Chancellors*, vol. ii (1906); E. Manson, *The Builders of Our Law, etc.*, 2nd ed. (1904).

SAINT-LÔ, capital town of the *département* of Manche, northwestern France, stands on the right bank of the Vire 48.5 mi. (78 km.) SSE of Cherbourg by road. Pop. (1962) 14,884. The town was almost completely destroyed in heavy fighting after the Allied landings in June 1944, being taken by U.S. forces on July 18. Its reconstruction, begun in 1948, included restoration of medieval ramparts (revealed by the bombardment) overlooking the Vire Valley. The Gothic Cathedral of Notre-Dame (14th–17th centuries) has also been partially restored. The 450-bed France–United States Memorial Hospital, designed by the U.S. architect Paul Nelson, was inaugurated in 1956. Saint-Lô is an administrative centre, the seat of a *préfecture*, and a market town. Light industry, chiefly the processing of local agricultural produce, has been developed. There is a large haras.

Called Briovera in Gallo-Roman times, Saint-Lô owes its present name to Laudus, bishop of Coutances (d. 565). In the Middle Ages it was an important fortress and a centre of the weaving industry. In 1574, having embraced Calvinism, it was stormed by the Catholics. In 1796 it replaced Coutances as capital of its *département*. (Y. Nc.)

SAINT-LOUIS, a town in the Republic of Senegal and former administrative capital of the French West African territories of Senegal and Mauritania. Pop. (1960) 48,840, including about 1,140 Europeans. Saint-Louis is 163 mi. (262 km.) NNE of Dakar by rail and lies on a narrow island near the right (west) bank, and 13 mi. (21 km.) from the mouth, of the Senegal River, which is there separated from the sea by the Langue de Barbarie sandspit. The island is linked to the mainland by the Faidherbe road bridge, which has an opening span at the western end, and with the suburbs on the Langue by two other bridges. The seaport, now in decline, is along the eastern shore of the island, the river port on the western. Around the square in the town centre are the Roman Catholic church, the buildings of the former administration of Senegal, and European shops. The town has spread to both banks of the river. The part on the Langue facing the island has wider streets, where the houses of the European community, around the buildings of the former administration of Mauritania, contrast with the thatched huts forming the fishing villages of N'Dar Toute and Guet N'Dar. Sor on the mainland has a European quarter along the river and African villages extending toward the marshes; it is the terminus of the railway from Dakar. From the airfield 2½ mi. NE scheduled services connect with Dakar and with Nouakchott, Mauritania. Saint-Louis has lost the importance it had as a capital, and as a seaport has been eclipsed by Dakar, but it remains an important trade centre whose development grows with the agricultural expansion in the Senegal valley. Founded in 1659, it was the first French settlement in West Africa. (J. D.)

SAINT LOUIS, the chief city of Missouri, U.S., 200 years old in 1964, is a mid-continental focal point of transport and manufacture. The incorporated area extends almost 20 mi. on the west bank of the Mississippi river, within 3½ mi. of the mouth of the Missouri river on the north. St. Louis is the central city of a standard metropolitan statistical area (SMSA) of 4,119 sq.mi., comprising, in addition to the city itself, the separately established St. Louis county, with 98 incorporated communities, and St. Charles, Franklin and Jefferson counties in Missouri as well as Madison and St. Clair counties in Illinois. Among the separately incorporated Missouri municipalities in the metropolitan area are Clayton, Kirkwood, Maplewood, St. Charles, University City and Webster Groves. For further information on these, and on Illinois cities in the metropolitan area, see *Government*, below.

Migration from the inner city is reflected in the population, which declined from 856,796 in 1950 (when it was eighth in population among U.S. cities) to 750,026 in 1960, a loss of 12.5%, ranking it tenth. At the same time the metropolitan area was making considerable gains, its 1960 population of 2,060,103 representing a 19.8% increase over 1950. The addition of Franklin county in 1963 to the SMSA resulted in an adjusted 1960 figure of 2,104,669. *See* also *Population Characteristics*, below.

History.—*French Period.*—The original site of St. Louis was a shelf of river front under a bluff, bordered by a wide prairie to which the community later spread. The location was chosen by Pierre Laclède Liguest, junior partner in a fur-trading company, organized in New Orleans, which had obtained the exclusive right to trade with the Missouri river Indians and with those west of the Mississippi above the Missouri. The monopoly was granted by the French director-general of Louisiana, who had not yet been informed that the territory had been ceded to Spain in 1762; it was withdrawn by the Spanish government in 1765 but by that time Laclède was already well established and he and his successors long remained important in the fur trade. The site for the community was well chosen for trade: downstream over 1,000 mi. was New Orleans, La., already a thriving commercial centre and a major fur market; the Great Lakes, Detroit, Mich., and Montreal, Que., were accessible by the Illinois river, entered 38 mi. upstream; the Ohio, joining the Mississippi 180 mi. to the south, was to become important later as a route for settlers from the east.

The village was named by Laclède for Louis IX, the crusader king of France. Clearing of the site began Feb. 15, 1764, under the direction of Auguste Chouteau, destined to become a leading citizen, though then only in his 14th year. Settlers in addition to the original party began arriving almost immediately; the treaty of 1763, ending the French and Indian War, had given Great Britain all the territory east of the Mississippi and many of the French residents of Cahokia and other Illinois villages began to cross the river to the new outpost rather than live under British rule. On the invitation of Laclède, Capt. Louis St. Ange de Bellerive, the French-Canadian commandant of the surrendered Fort de Chartres, brought over his garrison of 20 men and assumed administrative duties that Spain did not take over until 1770, when the first Spanish lieutenant governor of Upper Louisiana arrived.

Spanish Period.—The change in administrations did not significantly alter the course of the city's history or make any particular impress upon its culture, which remained predominantly French until large numbers of Americans arrived in the 19th century. Laclède died in 1778 and most of his functions fell upon Auguste Chouteau and his younger brother, Pierre Chouteau. The fur trade was a profitable business, with furs, acquired in exchange for supplies and showy articles of trifling value, bringing as much

as 500% profit overseas. Spain's sympathy with the American Revolution drew an attack on St. Louis in 1780 by a Sioux war party under British auspices. This was driven off by a garrison of 29 Spanish soldiers and 281 residents, though not before the death of 15 whites and 7 slaves, mainly in outlying areas. Except for such isolated incidents the community had a peaceful life; close and generally friendly relations were maintained with the Indians, and visiting chiefs often pitched their tepees in the gardens of their business hosts. In 1788 the Mississippi was cleared of pirates. The increased trade made St. Louis the centre of wealth and culture in the upper valley, in spite of its isolation; although by 1800 its population was still somewhat less than 1,000, some of its homes had good libraries and furniture, glass and china brought from France.

American Period.—Under the Louisiana Purchase (*q.v.*), St. Louis passed from France to the U.S. (the territory having previously been retroceded to France in 1800). On March 10, 1804, Capt. Amos Stoddard of the U.S. army officially took possession of Upper Louisiana for the U.S. In 1804 congress created the district of Louisiana, with St. Louis as district headquarters; in 1805 the territory of Louisiana was created, with St. Louis again the seat of government; and in 1812 the territory of Missouri was created, with St. Louis still the territorial capital. It was incorporated as a town in 1809. Population growth was slow; by 1815 it probably did not exceed 2,600, and in 1821, when Missouri was admitted to the union, there were 621 buildings and a population of 5,600. In 1822 St. Louis was incorporated as a city by the state legislature. As a result of urban-rural friction St. Louis ceased to be the capital upon the coming of statehood.

After the Louisiana Purchase, St. Louis became the crossroad of westward expansion of the U.S. and was also the starting point for exploring parties, one of the best known being that of Meriwether Lewis and William Clark in 1804–06. Jefferson Barracks on the Mississippi became an important military post; among the officers stationed there were U. S. Grant, Robert E. Lee and Jefferson Davis. Early in the 19th century fur trading, which had been carried on mostly by individual traders, began to be done by companies. In 1809 the Missouri Fur company was organized by William Clark, Manuel Lisa, Pierre and Auguste Chouteau, Sylvestre Labadie and others, and a branch of John Jacob Astor's American Fur company was established in the city in 1822.

In the War of 1812 the settlement raised 500 mounted rangers to patrol a cordon of 22 stations or family blockhouses along a 75-mi. line from Fort Bellefontaine to Kaskaskia, thus confining Indian forays to petty pilfering and raids on isolated homesteads. In the Mexican war of 1846 young St. Louisans volunteered enthusiastically, interest being heightened by a well-developed trade in mules and silver with the southwest. Cholera struck the city in 1832 and a recurrence in 1849 cost more than 4,000 lives. Fire spreading from burning steamboats made 1849 a year of disaster along the water front as well, hundreds of buildings being destroyed; this area, however, was rebuilt more substantially, with wider and better streets. In spite of these reverses, the census of 1850 showed a population of 77,860.

The American Civil War and Afterward.—In a border state where slavery was legalized, St. Louis was bitterly divided throughout the Civil War and was kept under martial law. Although early settlers had come mainly from Virginia, the Carolinas, Tennessee and Kentucky, they were followed by New Englanders and other northerners who, with the vigorous support of German-born residents, swung the balance to the Union side. A state-wide delegate convention held in St. Louis early in 1861 voted against secession and called for peaceful adjustment, impossible after the firing on Fort Sumter. Gov. Claiborne F. Jackson, having rejected President Lincoln's call for troops from Missouri, set up Camp Jackson in the neighbourhood of Olive and Grand avenues and assembled 800 militiamen. Meantime, discovery of Confederate arms shipments labeled "ale" and "marble" raised fear of an attack on the large Federal arsenal. Suspecting disaffection among regular army officers, Capt. Nathaniel Lyon supplemented a small Federal force by home guards made up largely of German voters who had been organized in political marching clubs during Lincoln's presidential campaign. Camp Jackson surrendered without bloodshed until pistol shots from a crowd of spectators drew fire from the raw recruits, leaving about 15 dead, including some of the captive militiamen, and 5 more mortally injured. Sympathy was further alienated from the Union cause the following day, May 11, when more newly enlisted "Wide Awakes," excited by a pistol shot killing one of their marchers, wheeled and fired down a city street, killing four of their own number and two civilians. Only the return of Gen. W. S. Harney, who marched four regiments of regulars into the heart of the city, restored order and stemmed a rush to leave the community.

War orders for clothing and supplies gave impetus to the city's commercial growth, already accelerated by the building of railroads in the 1850s. An earlier stimulus to the economy had been steamboat traffic, beginning in 1817 and declining by 1870. The city also developed as an outfitting point for trade with the southwest and the 1849 California gold rush. In the ten years up to 1870 population almost doubled, reaching 310,864. Eads bridge across the Mississippi, completed in 1874, gave access to the city for trains from Cincinnati; previously passengers from the east had been ferried.

A world's fair, the Louisiana Purchase exposition, was held in St. Louis in 1904. The city grew steadily in the late 19th and early 20th centuries, with both commerce and industry becoming increasingly important. World Wars I and II stimulated industrial development of the area. Other modern developments are discussed in *Government*, below.

Historic Sites.—A permanent Jefferson National Expansion memorial, administered by the national park service since 1935, was begun with the clearing of derelict buildings from 40 blocks along the river front. It includes, on the old levee, the 630-ft. stainless-steel arch designed by Eero Saarinen and symbolizing the gateway to the west. The oldest of the three remaining landmarks is the Old Rock house, built on the water front in 1818 for Manuel Lisa's fur trade. Another, the Old Cathedral of St. Louis of France, dates from 1831–34. The national park service rehabilitated the Old Courthouse, which was begun in 1839, and installed a historical museum which includes dioramas of early events. The 198-ft. dome above a 60-ft. rotunda bears frescoes by Carl Wimar, an early day artist. The courtroom where the Dred Scott case was heard occupies one wing.

Population Characteristics.—From the beginning St. Louis has been a cosmopolitan community, indicating the varieties of its heritages by wildly acclaiming the marquis de La Fayette on his visit in 1825, welcoming the Hungarian patriot Lajos Kossuth in 1852, and firing a 100-gun salute on the 100th anniversary of the birth of the German poet Schiller in 1859. The earliest settlers were French Creoles from New Orleans, French Canadians and a handful of Spaniards; after 1804 Americans began settling in the area and soon outnumbered the French. In the 19th century Germans became most numerous among the foreign born, their influx starting in the 1830s in response to glowing reports sent home by Gottfried Duden, a pioneering Prussian. Most numerous after the Germans were the Irish, and after them the British. In the population shift in the middle years of the 20th century a part of the outward movement from the city was compensated for by an influx from rural areas, including a large number of Negroes from the south. The nonwhite proportion of the population increased from 13.4% in 1940 to 29% in 1960.

Government.—By a charter of 1876, the city of St. Louis was established as a unit completely independent of the county and free from control of the state legislature except for general laws. A new charter in 1914, while retaining this feature, introduced several changes: the number of elective offices was reduced, the appointive powers of the mayor were increased, the city council was made a unicameral body, the budget system was introduced, the right to municipal ownership of utilities was granted and provisions were made for the use of the initiative, referendum and recall.

City boundaries as established in 1876 (and subsequently unchanged) prevented city services from following families moving out to less expensive or more satisfactory housing in suburban surroundings. The rapid, and largely planless, spread of the metro-

PIAGET

UNION STATION, 1896, WITH THE CARL MILLES FOUNTAIN "THE MEETING OF THE WATERS" IN FOREGROUND. THE FOUNTAIN, COMPOSED OF 14 BRONZE FIGURES, WAS COMPLETED IN 1940

politan area in the 20th century deprived the city of needed tax income; well-to-do and middle-class out-migrants were usually replaced by in-migrants of lesser means, who came largely from rural areas where farm mechanization had reduced the demand for labour. At the same time problems of traffic, parking and transportation were multiplied by persons driving to work in the central city. The complexity of local government is indicated by the fact that in 1960 there were 200 municipalities in the standard metropolitan statistical area, and St. Louis county alone had 28 school districts.

A privately financed metropolitan survey in 1958 recommended a functional but not political consolidation of city and county for joint handling of such common services as traffic and health. Three high-speed trafficways from beyond the city limits were built to bring more traffic into the downtown business district, suffering from the competition of one-stop shopping centres and places of amusement in outlying areas. New residential apartments for middle-income families were made possible in the vicinity of the business centre by urban renewal and slum clearance projects. Smoke elimination through regulation of the use of highly volatile coal was carried out successfully in the 1940s by an engineer, Raymond R. Tucker, subsequently elected mayor.

A housing rehabilitation program was allotted $4,000,000 from a $110,639,000 bond issue voted in 1955 for public improvements. Included was $10,000,000 for slum clearance. Neighbourhood pilot projects demonstrated that it cost less to rehabilitate some blighted areas than to clear slums and rebuild. In other areas public housing replaced substandard dwellings with apartments for low-income families. These buildings are in many instances 8 to 11 stories high and in one 28-block section doubled the density of population, with consequent traffic, school and other complications. A small public-housing program was undertaken in St. Louis county.

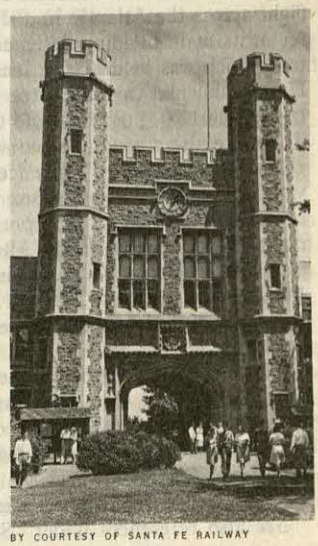
Though the suburbs are not without their fringe of shacks, in the main the old amenities have persisted. University City, the largest residential suburb in the county, borders on St. Louis and shares many of its problems. It was incorporated in 1906 and adopted a council-manager plan of government in 1947. Other nearby communities having a city manager are Webster Groves, Clayton, Berkeley, Olivette and Ferguson. Kirkwood dates from 1853, when 40 families moved there after railroad service was opened. Other county communities are Florissant, Jennings, Richmond Heights, Maplewood and Overland.

The municipality of St. Charles, across the Missouri river, dates from Spanish days, about 1679. It has a considerable industry. In Jefferson county are the twin towns of Festus and Crystal City. (For comparative population figures for the city of St. Louis and these suburbs *see* table in MISSOURI: *Population.*)

Illinois communities in this metropolitan complex had an early advantage in heavy industry because of high railroad rates for freight crossing the river; however, many of their residents now commute to daily employment in the central city. The largest of the Illinois suburbs is East St. Louis; ranking next is its neighbour, Granite City; followed by Belleville, Alton (*qq.v.*), Wood River and Edwardsville. (For comparative population figures for these municipalities *see* table in ILLINOIS: *Population.*)

The Economy.—Industry in the St. Louis area profits from adequate supplies of labour, raw materials and water, plus transportation service by many trunk-line railroads and several major highways, airlines and river-barge companies. Natural gas for industry is supplemented by coal from nearby Illinois fields. Almost three-fourths of all possible manufacturing categories are represented and no one industrial group employs more than 6% of the total factory force. Leading industries, ranked by value added by manufacture, are motor vehicles and equipment, beer and other beverages, petroleum refining, electrical industrial apparatus, meat products, organic chemicals, drugs and medicines, iron and steel foundries, paints and allied products, miscellaneous foods, structural and ornamental fabricated metalwork, service and household machines, bakery products, soap and related items and women's outerwear.

Education and Cultural Activities.—Two urban universities and numerous colleges, seminaries and trade schools draw thousands of students to the St. Louis area. St. Louis university, a Roman Catholic co-educational university founded in 1818, includes among others, schools of law, medicine and dentistry. It has branches at Florissant, Mo., St. Marys, Kan., and East St. Louis. The Pius XII library, built to preserve microfilms of Vatican library treasures, is on the St. Louis campus. Washington university, chartered in 1853, was founded by Rev. William Greenleaf Eliot, grandfather of the poet T. S. Eliot. Its adult-education division, University college, enrolls more than half of the total student body and also operates a civic education centre. This pioneer venture in problems of urban living relies heavily on tele-



BY COURTESY OF SANTA FE RAILWAY

WASHINGTON UNIVERSITY ADMINISTRATION BUILDING

vision programs directed toward small informal discussion groups, known as viewing posts. The centre also conducts civic leadership seminars and consultation services for community organizations. The two universities and the city school system share in an educational television station, KETC.

Other institutions of higher learning in the metropolitan area include, in Missouri, Fontbonne, a Roman Catholic college for women, chartered in 1917; Harris Teachers college, a municipally controlled co-educational institution established in 1857; and Maryville College of the Sacred Heart, a Roman Catholic women's college established in 1827, all in St. Louis; Lindenwood, a Presbyterian women's college established in 1827, in St. Charles; and Webster, a Roman Catholic college founded in 1915, in Webster Groves. The Illinois section of the metropolitan area includes Southern Illinois university branches at East St. Louis and Alton, with their headquarters at Edwardsville; the Principia college at Elsah, a private college founded in 1898, with enrollment limited to sons and daughters of Christian Scientists; and Monticello, at Alton, a private junior college for women, founded in 1835.

The St. Louis public-school system was integrated racially in 1955, without difficulty. The first public high school west of the Mississippi was established in St. Louis in 1856, followed in 1873 by the nation's first public kindergarten, installed by Susan Blow. William T. Harris (*q.v.*), then superintendent, introduced a phonetic system for reading and added natural sciences to the curriculum. He also founded and edited the *Journal of Speculative Philosophy* (1867–93), the first periodical of the sort in English.

Works of early artists such as George C. Bingham, Chester Harding and Carl Wimar, together with a large collection of historical writings, are part of the privately endowed Mercantile library (1846). The public library, with many neighbourhood branches, dates from 1865; the Symphony orchestra from 1881; the Academy of Science from 1856. The Missouri Botanical garden (1858), the gift of Henry Shaw, an early merchant, includes the headquarters of the National Council of State Garden Clubs. Relics of the past include the birthplace of Eugene Field (*q.v.*); the Campbell house (1851), an ante-bellum mansion open to the public, with a display of Victorian furnishings and clothing; and the log cabin in which U. S. Grant lived as a farmer for five years. A famous example of the original skyscraper architecture is the Wainwright building (1891), designed by Louis Sullivan.

In the latter part of the 20th century the city had two large daily newspapers, the *Post-Dispatch* and the *Globe-Democrat*, many local and neighbourhood journals, several television stations and a number of radio stations.

Parks and Recreation.—Of the city's recreational areas, Forest park is the largest, with 1,380 ac. At one entrance is the Jefferson memorial, housing the Missouri Historical society; one wing is filled with the collected souvenirs of Charles A. Lindbergh's flight across the Atlantic in 1927. On a hill is the City Art museum, its main building designed by Cass Gilbert for the world's fair, which was held at this location. The park contains the St. Louis Municipal Opera theatre (1919), which is an outdoor theatre seating 12,000 persons, and the municipal planetarium (1963). There are also a zoo, golf courses and other athletic facilities, including boating and a large ice-skating and roller rink used the year round, and the Jewel Box with flower displays. The county contains a Museum of Transport and maintains the Jefferson Barracks Historical Site park. Alton Lake, on the Mississippi river, provides harbours for small pleasure craft. Cahokia Mounds, a 144-ac. park between East St. Louis and Collinsville, preserves a number of examples of the work of a prehistoric race of Mound Builders.

The city is the home of the Cardinal baseball team and the Cardinal football team, and many athletic and other events are staged in Kiel auditorium, part of the civic centre. On the adjoining Aloe Memorial plaza, facing Union station, is the Carl Milles fountain "The Meeting of the Waters." An annual event since 1878 is the Veiled Prophet parade and ball.

SAINT LOUIS PARK, a city of Hennepin county, Minn., U.S., on the southwestern edge of Minneapolis (*q.v.*) and a part of the Minneapolis-St. Paul metropolitan area. After World War II it experienced great population growth, as did other cities around Minneapolis.

The first settlers in St. Louis Park were William Laycock and his wife, who built a log cabin on their claim in 1854. Sometime before 1886, the first depot was built by the Minneapolis and St. Louis railway. The village, first called Elmwood, was renamed after that railroad.

Farming was the main industry in the early days but gradually disappeared with the advent of suburban growth. Plans for the development of the city as a manufacturing suburb began as early as 1886. The panic of 1893 bankrupted several flourishing factories. Then new industries moved in and between 1900 and 1913 another cycle of decline and boom was experienced.

From 1914 to 1920 industry was on a reduced scale with the exception of important dairying and truck farming. Chief industries in the second half of the 20th century were metal and wood products.

St. Louis Park was incorporated in 1886 and its residents adopted a home rule charter in 1954; a council-manager form of government went into effect in 1955. For comparative population figures *see* table in MINNESOTA: *Population.* (R. W. F.)

SAINT LUCIA, a British colony, an island of the Lesser Antilles in the Caribbean Sea, forming part of the Windward Islands group, lies about 20 mi. (32 km.) S of Martinique, and about 25 mi. (40 km.) NE of St. Vincent. St. Lucia is 27 mi. (43.5 km.) long, has a maximum width of 14 mi. (22.5 km.) and an area of 238 sq.mi. (616 sq.km.).

Physical Features and Climate.—The island is of volcanic origin, and is bisected from north to south by a central ridge of wooded mountains, the highest point being Mt. Gimie (3,145 ft. [958.6 m.]) in the south. Many streams flow from the mountains through fertile valleys. In the southwest are the Pitons (2,619 ft. [798.3 m.] and 2,461 ft. [750.1 m.]), two immense pyramids of rock rising sharply from the sea and enclosing a small bay. Near Petit Piton is Soufrière, a low-lying volcanic crater. The boiling sulfur springs from which the town of Soufrière takes its name are at Ventine, 2½ mi. SE of the town. St. Lucia lies in the path of the northeastern trade winds and has a tropical maritime climate. Rainfall and temperature vary with altitude. Average annual rainfall ranges from 51 in. (1,295 mm.) on the coast to 117 in. (2,972 mm.) in the interior, the wettest months being from May to August. The temperature averages between 25.8° C (78.5° F) on the coast and 20.8° C (69.5° F) in the interior.

Population, Education, and Administration.—At the 1960 census the population of St. Lucia was 86,108. The original Carib race is extinct, the majority of the inhabitants of the island being Negroes and mulattos; the remainder are whites or of East Indian extraction. The chief town is Castries, built on a fine landlocked harbour, with a population (1960) of 4,353; other towns are Soufrière (2,692) and Vieux Fort (3,228). A French patois is spoken by most of the inhabitants, but is being gradually supplanted by English. Primary education is compulsory and the government subsidizes education through grants-in-aid to the island's denominational primary schools (about 50, principally Roman Catholic) and two Roman Catholic secondary schools.

St. Lucia's system of government is ministerial. The executive council consists of four elected members (including the chief minister and three other ministers), one nominated member, and one official member. The council is presided over by an administrator, who is appointed by the U.K. government. The legislative council, which has an elected majority, is presided over by a speaker elected by the council.

The Economy.—The island's economy is based on agriculture. Sugarcane was the chief crop until the mid-1950s, but by the early

1960s bananas had become by far the most important crop, comprising about two-thirds of the total value of exports. Other crops are coconuts, cocoa, cassava, fruit, vegetables, rice, spices, and cotton. The chief imports are flour, milk, cotton piece goods, cement, hardware, vehicles, machinery, chemical fertilizers, and boots and shoes. The unit of currency is the West Indian dollar with a par value of WI$1.714 to the U.S. dollar. The annual value of imports in the mid-1960s was about WI$14,000,000, and of exports about WI$7,000,000.

About one-fifth of the island is forested. There is a flourishing charcoal trade with Barbados. Fishing is carried on extensively for the local market. The island's few industries process sugar, rum, citrus produce, and edible oils; cigarettes and mineral waters are also manufactured. In the mid-1960s government revenues (including grants from colonial development and welfare funds) and expenditures balanced out at about WI$8,000,000.

There are two airports in St. Lucia—Beane Field and Vigie, which has an extended runway. Air services are provided by British West Indian Airways, and charter flights by KLM and British Guiana Airways. Steamers of the Harrison Line and Geest Industries Co. call at St. Lucia, and there are numerous small interisland craft.

History.—The exact date of the discovery of St. Lucia is not known, but it is thought to have been about 1500. It is quite possible that it was named by Columbus, although there is no record of this. The first attempts at colonization were made by the English in 1605 and 1638, but they were frustrated by sickness and the hostility of the native Caribs. A successful settlement was achieved in 1650 by the French from Martinique who made a treaty with the Caribs in 1660. Shortly afterward England regained the island, but it was restored to France by the Peace of Breda in 1667.

Another British settlement under a grant made in 1722 by George I to the duke of Montague was frustrated by France, and the island was declared neutral. In 1743 the French resumed possession, retaining the island until 1748 when the two countries again agreed to regard St. Lucia as neutral. In 1762 it was captured by Adm. George Rodney and Gen. Robert Monckton, only to be given up once more by the Treaty of Paris (1763). In 1778 it again surrendered to the British, who used its harbours as a naval base. Between 1782 and 1803 the possession of St. Lucia passed several times between Britain and France, the British having to suppress a vigorous revolutionary party, which was aided by insurgent slaves, before gaining possession in 1803. St. Lucia was finally ceded to Britain in 1814, when it became a crown colony. During 1838–85, together with the other islands of the Windward group, it was placed under the governor of Barbados.

French influence on the development of St. Lucia is illustrated by the preponderance of the Roman Catholic Church and the survival of a French patois. In the years following 1763 French planters came from St. Vincent and Grenada and established cotton and sugar plantations. In 1834, when the slaves were emancipated, there were in St. Lucia more than 13,000 Negro slaves, 2,600 free Negroes, and 2,300 whites. Prosperity was greatly retarded by frequent wars, epidemics of cholera and smallpox, and by the decline of the sugarcane industry. Improvement came with the increase of banana and cocoa cultivation and the revival of sugarcane.

Representative government was obtained by the constitution of 1924, which introduced an elective element into the legislative council; the constitution of 1936 provided for an unofficial majority in the council.

In 1958 St. Lucia joined the Federation of The West Indies. Under the 1960 constitution the post of governor of the Windward Islands was abolished and St. Lucia became an autonomous unit within the Federation, also achieving a greater degree of internal self-government. The Federation was dissolved on May 31, 1962. In November 1964 agreement on the establishment of a new West Indies Federation was reached by the regional council of ministers of the "little seven"—Barbados, Antigua, Dominica, Montserrat, St. Kitts-Nevis, St. Lucia, and St. Vincent. *See* also WEST INDIES; WEST INDIES (FEDERATION), THE. (R. To.)

SAINT-MALO, a seaport of Brittany, France, lying on the right bank of the Rance River at its mouth. It is the chief town of an *arrondissement* in the *département* of Ille-et-Vilaine. Pop. (1962) 16,981. The old walled city stands on a granite isle which is joined to the mainland by an old causeway, *Le Sillon* ("furrow"), and the modern boulevard Louis-Martin. Largely destroyed in 1944, the town and its suburbs were rebuilt and its historic buildings were restored or reconstructed. The cathedral (Saint-Vincent's Church since the bishopric was lost in 1790), shipowners' mansions, law courts, and the 14th–15th-century castle with four towers (one of which, the great keep, houses a history museum) are still to be seen. The ramparts surrounding the town include portions dating from the 12th century but were mainly rebuilt at the end of the 17th and the beginning of the 18th century and restored in the 19th. An important tourist resort, the town has sandy beaches, a casino, sports stadium, race course, swimming pool, yacht club, tennis courts, and fishing facilities.

The town is connected by road and rail with Rennes, and British steamer services link it with both Southampton and Jersey. The nearest airport is at Pleurtuit near Dinard. The harbour is contiguous with that of Saint-Servan. Apples, potatoes, and cauliflowers are principal exports; imports include coal, timber, and wine. Trade is mainly with Britain and Scandinavia. A substantial fleet of trawlers visits the cod fisheries of Newfoundland and Greenland. Saint-Malo probably derives its name from the Welsh monk Maclow (Maclou or Malo) who fled there in the 6th century and later became bishop of Aleth (Saint-Servan). In the 12th century the see of Aleth was transferred to Saint-Malo, when the bishop Jean de Châtillon took refuge there from the Normans. He built the cathedral, manor houses, and ramparts. The city thereafter became a great seaport and the dukes of Brittany and the kings of France granted it many privileges. For four years in the 16th century it was an independent republic. In the 17th and 18th centuries Saint-Malo flourished, both as a centre for privateering and as a participant in many colonial ventures. Shipbuilding, deep-sea fishing, slave trading, and foreign trade were then the main occupations. Among the famous men born at Saint-Malo are J. O. de Lamettrie, F. R. de Chateaubriand, Hugues F. R. de Lamennais, F. J. Broussais and the mariners J. Cartier and R. Duguay-Trouin (*qq.v.*).

Saint-Servan, one mile south of Saint-Malo and formerly a suburb, was made a separate commune in 1789. Pop. (1962) 13,479. Its origins go back to the Gallo-Roman city of Aleth. The 14th-century tower of Solidor was built by John IV, duke of Brittany, as a lookout over the Rance estuary, and was later used as a prison. Saint-Servan was also formerly involved in Corsair activities, ships being built in the small harbours of Port Saint-Père and Port Solidor. The old site of Aleth was made into a powerful German stronghold in World War II.

In the 1960s a dam crossing the Rance estuary and carrying an 800-yd. road was under construction. The project was expected to include the first tidal power station in the world. (D. La.)

SAINT-MARTIN, LOUIS CLAUDE DE (1743–1803), French illuminist who signed his works "LE PHILOSOPHE INCONNU," was born at Amboise on Jan. 18, 1743. He studied law and practised for six months at Tours, but joined the army in 1765. Stationed at Bordeaux, he came under the influence of the Jewish visionary, Martinez Pasqualis. Saint-Martin left the army in 1771 and began to propagate mysticism, first in Paris under Martinez Pasqualis and later in Lyons, where he was active in masonic lodges. His first book, *Des Erreurs et de la vérité* (1775), in which Gnostic theories were used to refute Condillac's materialism, won him the favour of certain literary groups among the nobility. On his return to France in 1788 after visiting England and Italy he settled in Strasbourg, where he met Charlotte de Boecklin and Rudolphe Salzmann. These two introduced him to the writings of Jakob Boehme, under whose influence he gradually broke loose from that of Martinez Pasqualis. In 1794 he was exiled from Paris and retired to Amboise.

During the French Revolution he was arrested as an aristocrat and was about to appear before the revolutionary tribunal when

the overthrow of Robespierre in July 1794 freed him. Two years later he published his *Considérations sur la révolution française*, in which he proposed theocracy as the ideal form of society. Later he came under the influence of Swedenborg. He died at Aulnay, near Paris, on Oct. 13, 1803. His works include *L'Homme de désir* (1790); *Le Nouvel Homme* (1792); *Éclair sur l'association humaine* (1797); *Le Crocodile* (1798), an allegorical poem; *De l'Esprit des choses* (1800); and *Le Ministère de l'homme-esprit* (1802; Eng. trans., *The Ministry of Man and Spirit*, 1864). Other treatises appeared in his *Oeuvres posthumes* (1807).

See A. E. Waite, *The Life of Louis Claude de Saint-Martin* (1901); R. Amadou, *Louis Claude de Saint-Martin et le Martinisme* (1946).

SAINT MARYS, a city of western Auglaize County, O., U.S., on the eastern shore of Grand Lake (Lake Saint Marys), 95 mi. N of Cincinnati. On an important portage between rivers connecting the Great Lakes and the Ohio River, it was the site of Girty's Town, the trading post of an American renegade named James Girty, in the 1780s; Ft. Saint Marys, supply post in the Indian wars of the 1790s; Ft. Barbee in the War of 1812; and the negotiation of an important Indian treaty in 1818. Platted in 1823, it became a city in 1903. German and Irish ancestry predominate in the population. Industrial output includes blankets, rubber products, heavy machinery, and processed foodstuffs. Grand Lake, constructed (1837–1845) as a reservoir to feed the Miami and Erie Canal, is now used for recreation and contains a large warmwater fish hatchery. For comparative population figures *see* table in OHIO: *Population.* (D. L. S.)

SAINT MARYS RIVER, a stream, about 63 mi. long, connecting Lake Superior with Lake Huron and forming part of the international boundary between northeastern Michigan, U.S., and Canada. The upper third of the river is at the Lake Superior level, but at Sault Ste. Marie (*q.v.*) it drops about 20 ft. in a distance of about one mile through the Sault Ste. Marie Rapids to the level of Lake Huron. The rapids, impassable for navigation, are bypassed by the American and Canadian ship canals which contain a total of five locks. The lower river is divided into a series of lakes and channels by large islands. The river is the narrowest part of the Great Lakes system and a natural crossing site which was used by the Indians and visited by early French explorers. (C. M. DA.)

SAINT-MAUR-DES-FOSSÉS, a town in the *département* of Val-de-Marne, France, and a southeastern suburb of Paris, lies on the right bank of the Marne, within a loop of the river, about 6 mi. (10 km.) from the city centre. Pop. (1962) 70,295. Saint-Maur developed as a residential district after the apportionment of the Condé domains in 1831, and in spite of increasing urbanization has retained the character of a garden suburb. Horticulture flourishes and the few industries include the production of chemicals, corks, and felt. There is an observatory (founded 1880) and a waterworks which supplies Paris from the Marne.

In the Middle Ages the land belonged to an abbey founded in the 7th century. This was secularized in the 16th century, and on the site of the abbot's quarters Philibert Delorme built a château (1541–47) for the bishop of Paris, Cardinal Jean du Bellay, which later passed to Catherine de Médicis and then to the house of Condé. Rabelais stayed there. The other abbey buildings were demolished in the 18th century. (H. DE S.-R.)

SAINT MICHAEL'S MOUNT, a lofty pyramidal island of granite, rising about 400 yd. (365 m.) from the shore of Mount's Bay, and included in the West Penwith rural district of Cornwall, Eng. Pop. (1961) 47. It is united with Marazion by a natural causeway passable only at low tide. The Mount, topped by a very ancient building, can be seen from any part of the coast between Mousehole and Cudden Point. It was given by Edward the Confessor to Mont-Saint-Michel in Normandy, of which abbey it continued to be a priory until the dissolution of the alien houses by Henry V, when it was given to the abbess and convent of Syon in Middlesex. It came into the possession of the crown after the Reformation and governors were appointed by the monarch.

It was a resort of pilgrims, encouraged by Pope Gregory, in the 11th century and in the 12th century the monastery was rebuilt by Bernard, the abbot of Mont-Saint-Michel. The Mount was captured by Henry Pomeroy in the reign of Richard I, and John de Vere, earl of Oxford, seized it and held it against the king's troops in 1473. Perkin Warbeck occupied it in 1497. Humphry Arundell, governor of St. Michael's Mount, led the rebellion of 1549. During the reign of Elizabeth I it was given to Robert, earl of Salisbury, by whose son it was sold to Sir Francis Basset, whose brother, Sir Arthur Basset, held it against the parliament until July 1646. It was sold in 1659 to Col. John St. Aubyn, and his descendant, Lord St. Levan, has a residence in the castle. In 1954 an arrangement was made between the St. Aubyn family and the National Trust, whereby the latter have taken over the Mount, subject to certain rights in favour of the present Lord St. Levan and his heirs. Of the original monastic buildings, the refectory (Chevy Chase room) is the chief survival. The chapel of St. Michael, which is extra-diocesan, is a beautiful 15th-century building with an embattled tower.

The harbour, widened in 1823–24 to allow vessels of 500 tons to enter, has a pier dating from the 15th century.

SAINT-MIHIEL, a small town (5,203 inhabitants in 1962) of northeastern France, in the *département* of Meuse, is situated on the right bank of the Meuse River, where its valley is entrenched in the Corallian limestone plateau of western Lorraine, 22 mi. (35 km.) S of Verdun by rail. Its nucleus was the Benedictine abbey established in 709. The abbey buildings, which are now occupied by municipal offices, date from the end of the 17th century and the beginning of the 18th. Both the abbey church and that of Saint-Étienne contain famous work by Ligier Richier (1506–67). Though less important than the great fortress of Verdun (*q.v.*), Saint-Mihiel was one of the fortified towns guarding the strategic line of the Meuse on the approach to the heart of the Paris Basin from the east. Captured by the Germans in September 1914 at the beginning of World War I, the town was not retaken by the Allies until September 1918 in an offensive in which the American troops under General Pershing played the major role. This was the first occasion on which the American Army in France had mounted an offensive as a unit. The rapid and successful outcome of their attack was a heavy blow to the morale of the German Army. (AR. E. S.)

SAINT MORITZ, a spa, winter sports, and summer resort in the Upper Engadine and the southeastern Swiss canton of Graubünden (Grisons), 6,089 ft. (1,856 m.) above sea level. The area is part of the great watershed from which the glacier waters feed the Rhine, Po, and Danube. The commune comprises the Dorf (village), Bad (spa), Suvretta, and Champfèr. There were (1960) 3,751 inhabitants, and 10,000 visitors can be accommodated. The chief buildings are the curative baths, the Engadine Museum, the museum named after the landscape painter Giovanni Segantini (1858–99), the 12th-century (restored) leaning tower (part of the former church of St. Maurice), and the Druidenstein, the remains of a druid stone system. There are many miles of promenade, three funiculars, and several cableways and ski lifts. The resort is on an international highway and has local coach services; it is linked by rail with international lines, and the airport of Samedán is about 4 mi. (6 km.) NE. The life of St. Moritz depends on tourism and the hotel industry, which, with its sports facilities, are well developed.

SAINT-NAZAIRE, a west-coast port of France and outport for Nantes. Chief town of an *arrondissement* in the *département* of Loire-Atlantique, it lies at the mouth of the Loire on the right bank 37 mi. (60 km.) WNW of Nantes by rail and 28 mi. (45 km.) by river. Pop. (1962) 49,331. The town was almost completely destroyed during World War II. During its rebuilding it was given wide streets, such as the central shopping district, Avenue de la République. The shipbuilding yards are among the largest in Europe, and the liners "Normandie" and "France" and the battleship "Jean Bart" were built there. There is also a fishing port; the catch consists of sardines, tunny, and shellfish. The town has aircraft works, canning plants, steelworks, and a chemical factory for processing phosphates.

Saint-Nazaire is believed to be the site of Corbilo, which Strabo mentions among the most important coastal towns of Gaul. Toward the end of the 4th century it was occupied by Saxons, and

they were converted to Christianity in the 6th century by St. Felix, bishop of Nantes (d. 582), when the town took its present name. It was a small fishing village until the mid-19th century, when work began on the port. The first dock was opened in 1856 and shipbuilding yards were installed in 1861–62. During World War II the town was occupied by the Germans, who used the port as a major Atlantic submarine base. The ships "Tirpitz" and "Bismarck" harboured there. In 1942 the docks were blown up by the British and were not restored for service till 1946.

The seat of the *sous-préfecture* was transferred from Savernay to Saint-Nazaire in 1868; in 1879 a chamber of commerce was established and later a tribunal of commerce. (M. Mt.)

SAINT NICOLAS, Belgium: *see* Sint-Niklaas.

SAINT-OMER, chief town of an *arrondissement* in the *département* of Pas-de-Calais, northern France, is situated near the plain of Flanders on the Aa River at its junction with the Neuffossé Canal. Pop. (1962) 18,180. Saint-Omer was the seat of a bishopric and the church of Notre Dame was a cathedral from 1563 to 1801. The 13th–15th-century church contains the 8th-century tomb of St. Erkembode and the 13th-century tomb of St. Omer. There are two museums, the Henri Dupuis Museum of Natural History and Folklore, and the Fine Arts Museum, housed in the 18th century hôtel Sandelin, and a municipal library with illuminated manuscripts of the 8th–16th centuries.

St. Omer, bishop of Thérouanne, founded a monastery there in the 7th century, and built a small church, Notre Dame, on a hill above the Aa; St. Bertin gave his name to the abbey on the river, and a village known as Saint-Omer grew up between the two churches during the 8th century. St. Bertin's abbey fell into ruin at the Revolution, and its tower finally collapsed in 1947. In the 9th century the counts of Flanders erected a fortress and the settlement was enclosed by walls. In the 10th century, under Abbot Odbert, the abbey became a cultural centre producing fine illuminated manuscripts in the style of Winchester. In the 11th and 12th centuries the town had important commercial relations with England and Scotland, which provided much of the wool necessary for its cloth trade. In 1154 Henry II gave privileges to the merchants of Saint-Omer to trade in London, privileges which remained in force until Edward III banned the export of English wool. The cloth industry never recovered from this blow and the subsequent wars, famine, and plague, though some cloth was exported to France, Spain, Italy, and even Russia. In the early 17th century tobacco processing was introduced, and this new industry continued until the tobacco monopoly was set up in 1810. Saint-Omer now produces paper, glass, cement, and linen goods. The surrounding marshes have been drained since the late 18th century and produce fruit and vegetables which are exported to other parts of France. (Ge. C.)

SAINT-OUEN, an industrial suburb of greater Paris in the *département* of Seine-Saint-Denis, lies on the right bank of the Seine River, 8 km. (5 mi.) N of Notre Dame Cathedral. Pop. (1962) 51,471. Formerly a village, formed around a sanctuary in the Carolingian period (8th–10th centuries), where the kings of France had a residence in the Middle Ages, Saint-Ouen developed into an industrial centre in the 19th century. Docks, factories, and workshops were built around the 12th-century church and the château (1822) in a disorderly fashion to the detriment of the residential quarters. Metallurgical industry and automobile manufacturing are the principal activities and there are some light industries. To the east stretches a large cemetery; a picturesque and lively "flea market" is held three times a week and attracts Parisians in search of bargains in furniture, curios, and antiques. (H. de S.-R.)

SAINT PAUL, capital city of Minnesota, U.S., seat of Ramsey county and a port of entry, is located 2 mi. below the head of navigation on the Mississippi river and adjacent to Minneapolis; it is about 350 mi. N.W. of Chicago. It has 16 mi. of river frontage along a deep S-shaped bend of the Mississippi which flows south to its confluence with the wider Minnesota river, northeast past the business district, and then sharply south again in its broadening valley. The heart of the city, built upon a series of terraces which rise from the river (altitude, 703 ft.) to the surrounding glacial plains (altitude, 900 ft.), presents a striking skyline from the southern and eastern approaches, and various points along the heights within the city afford sweeping views across the river valley. The downtown area, surrounded by hills, grew up with an irregular street pattern which is reminiscent of older eastern cities. St. Paul and Minneapolis (*q.v.*), to the west and north, are contiguous and, though very different in character and development, are often called the Twin cities.

History.—In 1680 Father Louis Hennepin passed the site of St. Paul, and in 1766 Jonathan Carver, searching for the northwest passage, explored a cave near the area. In 1805 Lieut. Zebulon Montgomery Pike, leader of a U.S. expedition, camped beneath the bluffs of the Minnesota and Mississippi rivers on what is known as Pike Island where he made an unofficial treaty with the Sioux for possession of the region, including the commanding site above him on which Fort Snelling was later built. The first claim in what is now St. Paul was made in 1838 by Pierre "Pig's Eye" Parrant. The landing was known as Pig's Eye until 1841 when Father Lucian Galtier built a log chapel dedicated to St. Paul. In 1849 St. Paul became the capital of the newly formed Minnesota territory. Settlers, mainly from the eastern states, poured into the river town which was incorporated in 1854, its population by 1860 exceeding 10,000.

Industrial and Commercial Growth.—St. Paul's historic importance in the development of the upper midwest was as a commercial centre located near the head of navigation on the Mississippi river. Furs were its first products for the outside market, with groceries and dry goods assuming early importance. The first private bank in the territory was established in St. Paul in 1852 and the First National Bank of St. Paul was organized in 1863. In 1862 the first train left the city on the 10-mi. track of the St. Paul and Pacific railroad. In 1883 a great celebration marked the completion of the Northern Pacific railroad to the west coast, and 11 years later the Great Northern railroad, under the leadership of James J. Hill (*q.v.*), was completed. Banking in St. Paul has continued its close affiliation with the railroads whose development gave it the name, "gateway to the great northwest."

St. Paul's manufacturing developed slowly in a diversified pattern based upon the resources and needs of the surrounding country. Boots and shoes ranked first among the industries in the 1870s. In 1882 the Union Stock Yards company was established by the railroads. By mid-20th century the livestock market, now in suburban South St. Paul, was one of the world's largest public livestock markets in salable receipts. There are numerous printing and publishing houses including an important law publishing firm. Among the largest employers are manufacturers of automobiles, electronic communications equipment, abrasives and magnetic tape, refrigerators, construction equipment, advertising specialties and beer. Two large oil refineries and three chemical plants were brought to the St. Paul area by the development of industrial sites along the river to the south of the city.

Population and Administration.—St. Paul is in the Minneapolis-St. Paul standard metropolitan statistical area comprising the counties of Anoka, Dakota, Hennepin, Ramsey and Washington, which according to the federal census of 1960 had a population of 1,482,030. The population of St. Paul proper was 311,349 in 1950 and 313,411 in 1960 (for comparative population figures *see* table in Minnesota: *Population*). Its period of greatest growth was between 1880 and 1895 when the population increased from approximately 40,000 to 140,000. During this period also the proportion of foreign born reached its peak, with Germans and Irish leading in numbers. This phase of immigration underlies the character of the modern city, though by 1930 when the population was 271,606 the foreign born included a high percentage of Scandinavians and also east Europeans, Italians and Mexicans. St. Paul is the seat of a Roman Catholic archdiocese which was built up by Archbishop John Ireland (*q.v.*) who greatly influenced the development of the city. Roman Catholics in the early 1960s numbered about two-fifths of the population, though Protestant, Jewish and Orthodox faiths were well represented.

Under the commission plan of government, adopted by the voters in 1912, city officials are elected for two-year terms. The

legislative council consists of the mayor and six commissioners who serve as administrators of the various city departments. Judges of the municipal court are also elected officials as are the seven members of the board of education, who serve without pay.

Transportation.—St. Paul is served by nine first-class railroads which own and operate a terminal switching line in the city. By mid-20th century it had become one of the largest trucking centres in the nation. The rafting industry, carrying logs and lumber down the river, was important to St. Paul until about 1900. The last raft left in 1914, but river traffic attained a new significance in the late 1950s and 1960s with 25 barge lines carrying about 2,000,000 tons of bulk commodities such as coal, grain, oil and fertilizers between the Port of St. Paul and Mississippi river markets and Gulf ports. St. Paul and Minneapolis are jointly served by the Wold-Chamberlain International airport.

Education, Culture and Recreation.—Liberal arts colleges in St. Paul include the College of St. Thomas, for men (Roman Catholic, 1885); the College of St. Catherine, for women (Roman Catholic, 1905); Macalester college (Presbyterian, 1885); Concordia college (Lutheran, 1905); Hamline university (Methodist, 1854); and Bethel College and Seminary (originally established in 1871 as Scandinavian Department of Baptist Union Theological Seminary of The University of Chicago) since 1947, a four-year college. The University of Minnesota Institute of Agriculture has a large campus in the northeast corner of the city. Luther Theological seminary and St. Paul seminary (Roman Catholic) are in St. Paul, and the William Mitchell College of Law gives a full degree through evening courses. Parochial and private schools are well represented, and a recognized program for pupils of all levels of ability was instituted in the city's public schools.

An Italian Renaissance building, built in 1916, houses both the public library and the James Jerome Hill reference library, a private corporation with especially extensive collections in economics, science and technology. The Minnesota Historical society, founded in 1849, has an outstanding collection of manuscripts and printed materials and also a museum relating to the region. The science museum of the St. Paul institute, founded in 1906, supported 50% by public funds, houses exhibits of anthropology, geology and related sciences. The St. Paul Gallery and School of Art, supported 13% by public funds, has, since 1926, encouraged crafts and local arts. St. Paul has long been known as a musical city. The Schubert club, founded in 1882, provides a distinguished concert series and sponsors a scholarship program, and the St. Paul Civic Opera association has, since 1934, encouraged local talent through its productions. More than 1,000,000 people attend the annual state fair, held in the grounds near the Institute of Agriculture, and since 1886, when the first ice palace was built, the St. Paul Winter carnival has been a colourful annual event. Perhaps the most distinctive of the city's entertainment events is the biennial Festival of Nations first sponsored in 1932 by the International institute and featuring dances, handicrafts and foods of many nations. A distinctive social service in the city is the Wilder Charities, established in 1910 under a trust fund by Amherst H. Wilder "for the benefit of the poor of the city." The Municipal auditorium, built in 1907, and enlarged in 1932, seats 15,000 and the Municipal stadium, built in 1954, holds 10,000.

Buildings and Parks.—A city of quiet, tree-shaded streets and middle-class homes, St. Paul is crowned by Summit avenue which, progressing westward from the bluffs overlooking the business district, reveals along its 4½-mi. length the changing styles of residential and church architecture, beginning with the impressively located baroque Cathedral of St. Paul which overlooks the city and the mansion of James J. Hill, built in 1887, passing the bold and symbolic structure of Mount Zion temple, completed in 1954, and ending with the homes of the mid-20th century. Among the landmarks is the home of Gov. Alexander Ramsey, a fine example of the dignified domestic architecture of the 1880s. The Federal Courts building (1900) is a delightfully bizarre example of French Renaissance architecture. In the concourse of the 19-story functional City hall and Ramsey County courthouse, erected in 1931, stands the huge rotating onyx figure of the Indian God of Peace by the Swedish sculptor Carl Milles. The Woman's City club overlooks the river. The First National bank has, since 1931, with the Cathedral of St. Paul and the capitol building (designed by Cass Gilbert and inspired by Italian High Renaissance) both on the bluffs behind it, dominated the sky line. Extensive clearing, begun in 1956, has beautified the capitol approach which gives, from its height, a spectacular vista of the city and the valley beyond.

St. Paul has 11 major parks, the most interesting of which are Como park, begun in 1872, with its lake, greenhouse and zoo, and Indian Mounds park, where Indian burial mounds dot the margin of the bluff which gives a sweeping view across the southward course of the river and of the city to the east. (MA. C. B.)

SAINT PAUL ROCKS, also known as Rochedos São Paulo and as St. Peter and St. Paul, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 mi. from South America, in 29° 15′ W. The whole space occupied does not exceed 1,400 ft. in length by about half as much in breadth. Besides seafowl the only land creatures are insects and spiders. Fish are abundant, seven species being collected by the "Challenger" expedition (*q.v.*). The islets contain rock that geologists estimate may be 4,500,000,000 years old, about 1,000,000,000 years older than any other terrestrial rock that has been studied. (J. L. TR.)

SAINT PETER PORT, the chief urban agglomeration and centre of government of Guernsey (*q.v.*), Channel Islands, is situated on the east coast of the island where a narrow valley reaches the sea between moderately high cliffs and where there was a good landing beach protected from prevailing winds and also an excellent roadstead for ships riding at anchor. Early in the 13th century this roadstead was protected by the building of Castle Cornet on a tidal islet less than half a mile offshore, reinforced later with La Tour Beauregard on the mainland of Guernsey. The Anglo-Gascon wine trade was then beginning to develop and the existence of this well-protected roadstead, together with Guernsey's position so near the natural route of medieval shipping up and down the English Channel, meant that St. Peter Port was used increasingly as a refuge and port of call (in 1329 by more than 500 ships). A small town naturally grew up there. Pop. (1961) 15,706.

Late in the 13th century a quay was built, and in 1309 the chief market of the island was moved to St. Peter Port, then described as "a kind of borough" (*quasi-burgum*). In 1350 the king ordered that it should be surrounded with a wall, though there is no clear evidence that this order was carried out.

From the middle of the 14th century the fortunes of the town and port have followed those of the island. The quay was extended in the 16th century, a second arm built in the 18th, and the present fine harbour constructed between 1853 and 1874. Until the 19th century the built-up area of the town hardly extended beyond the original valley and a northern extension along what is now the High Street and the Pollet, but now almost the whole island has become an urban area. The earliest surviving reference to the church of St. Peter (*ecclesia Sancti Petri de Portu*) occurs in a charter of *c.* 1048. This ancient church preserves work of almost every century from the 13th (the walls of the nave may be older) and has some claim to architectural distinction. Other buildings of note are the Royal Court House (1799), the Markets (1822), Elizabeth College (1826; founded 1563), the Constables' Office, and several fine houses. Hauteville House, former residence of Victor Hugo (1856–70), is now the property of the city of Paris.

See J. H. Le Patourel, "The Early History of St. Peter Port," *Transactions of La Société Guernesiaise*, xii, 171–208 (1934); E. F. Carey, "The Growth of St. Peter Port in the Early 19th Century," *ibid.*, 153–170. (LE P.)

SAINT PETERSBURG: *see* LENINGRAD.

SAINT PETERSBURG, a resort city, is located on the west coast of Florida, U.S., in Pinellas county. Occupying the tip of Pinellas peninsula in Tampa bay, it is connected by the 7-mi. Gandy bridge with the mainland toward Tampa, 20 mi. N.E., and by the 15-mi. Sunshine skyway, consisting of five bridges and six causeways, with the mainland south-southwest toward Bradenton and Sarasota. Bridges and causeways to the west provide access across Boca Ciega bay to island beaches along the Gulf of Mexico.

Pop. (1960) 181,298; Tampa-St. Petersburg standard metropolitan statistical area (Hillsborough and Pinellas counties), 772,453. (For comparative population figures *see* table in FLORIDA: *Population; see* also TAMPA.)

Known as the "Sunshine city," St. Petersburg was named for the birthplace in Russia of Peter A. Demens who with John C. Williams of Detroit founded the Florida city. In 1888 Demens completed a railway connecting it with the St. Johns river, then the main artery of traffic to interior Florida. Settlers and tourists were attracted by development projects of the Hamilton Disston corporations which owned much of the surrounding area. The city was incorporated in 1892 and adopted a council-manager form of government in 1931. There are several hundred small, diversified industries and branch shops and plants of national corporations. A large number of retired persons live in the city.

A one-half mile municipal pier has fishing balconies, a museum, a solarium and pools. Bays, harbours and marinas about the city accommodate a large fleet of pleasure craft which frequently participate in races and regattas. Other recreational and entertainment attractions are band concerts, major-league baseball teams in spring training, fishing, golf and other out-of-door sports.

The public-school system is headed by the St. Petersburg junior college, founded in 1927. Among other educational institutions are the Admiral Farragut Naval academy (preparatory) and the Law College of Stetson university. (A. J. H.)

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, ABBÉ DE (1658–1743), French publicist and theoretical reformer who was one of the first authors of modern times to propose the establishment of an international organization for the maintenance of peace. He was born at Saint-Pierre-Église, near Cherbourg, on Feb. 13, 1658, the son of a Norman aristocrat. After wide-ranging studies at Rouen and Caen, he went to Paris in 1680, where he frequented the *salons* of Mme de la Fayette and of the marquise de Lambert. In 1693 he gained a footing at court as almoner to Madame (the duchesse d'Orléans), who presented him to the abbacy of Tiron, a comfortable benefice. He entered the Académie Française in 1695. From 1712 to 1714 he acted as secretary to Melchior de Polignac, the French plenipotentiary at the Congress of Utrecht. Because of the political offense given by his *Discours sur la polysynodie,* he was expelled from the Académie in 1718. He died in Paris on April 29, 1743.

Saint-Pierre's works are almost entirely occupied with an acute criticism of politics, law, and social institutions. They had considerable influence on Montesquieu and on Rousseau, who edited and redressed several of them and reproduced many of their ideas in his own work. Saint-Pierre's chief work, *Le Projet de paix perpétuelle* (1713; several later modified editions; *see* bibliography), was translated into English as early as 1714, and, as a scheme for securing universal peace, it has exercised continual influence up to the 20th century.

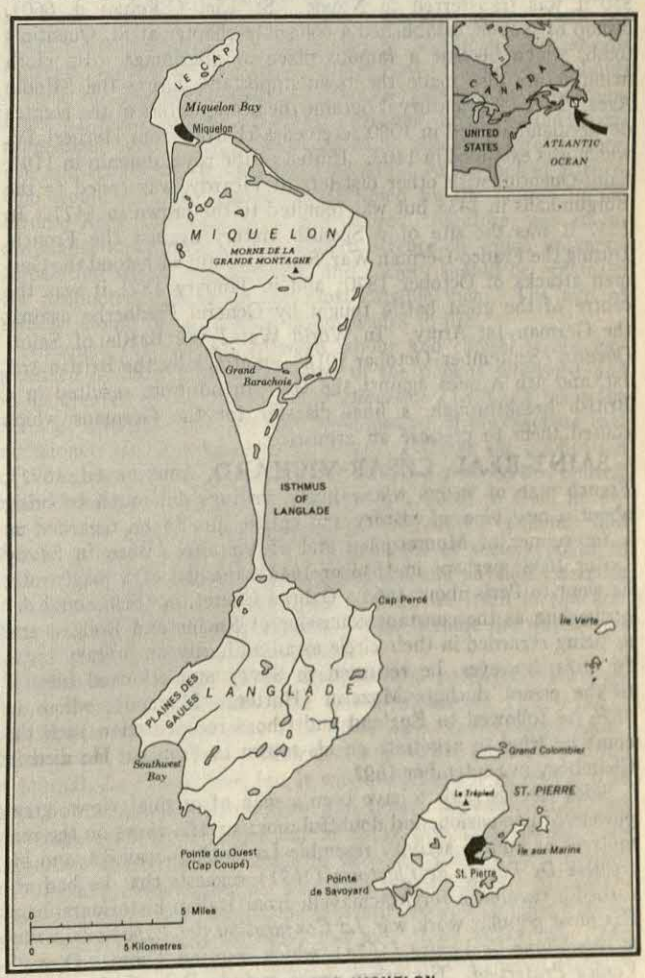
Drouet, 1912); *A Project of Perpetual Peace* (1927), Rousseau's modified edition and essay (both written in 1756), trans. by E. M. Nuttall, and printed in French and English, with an introduction by G. Lowes Dickinson; J. Drouet, *L'Abbé de Saint-Pierre: l'homme et l'oeuvre* (1912); M. L. Perkins, *The Moral and Political Philosophy of the Abbé de Saint-Pierre* (1959). *See* also F. H. Hinsley, *Power and the Pursuit of Peace,* ch. 2 (1963).

SAINT PIERRE AND MIQUELON, an archipelago off the south coast of Newfoundland, Canada, is the only remaining overseas territory of France in North America. The area of the main islands is 93 sq.mi. (241 sq.km.), 83 sq.mi. (215 sq.km.) of which are in the Miquelons (Miquelon and Langlade, sometimes known as Great and Little Miquelon, connected by the slim, sandy Isthmus of Langlade); but St. Pierre, only 10 sq.mi. (26 sq.km.), has almost seven-eighths of the population and is the administrative and commercial centre.

The landscape is stark and hilly with a rugged shoreline. Bedrock protrudes widely from the thin glacial soils. The forest cover was long ago removed for fuel, and the existing vegetation is scrubby heath, with some stunted trees on Langlade. Vegetable gardens and hayfields adjoin settlements and there is some rough grazing. The climate is humid with an annual precipitation of about 60 in. (1,500 mm.), of which about 12% occurs as snow in winter. The local fogs increase the dampness, but the winters are milder than in the Newfoundland interior, and sunshine is plentiful in winter and midsummer. Average temperatures are between 15° and 16° C (60° F) in July and −4° C (25° F) in January; the extreme minimum is about −18° C (0° F).

The islands were first settled by France during the early 17th century; they subsequently changed hands with the British several times, but were restored to France in 1816 under the Treaty of Paris. The people are descended from inhabitants of the Atlantic coast of France. The language is French, and French customs and traditions are sustained by exchanges with the mother country, although modern communications have introduced North American influences. Most of the people live in the capital city, St. Pierre (pop. [1962] 4,287), and only 628 inhabit the island of Miquelon. There are Roman Catholic churches in St. Pierre and in Miquelon. Primary education is free and parochial; state and private primary and secondary schools have a total enrollment of about 1,400.

The inhabitants are French citizens and enjoy universal suffrage. The territory is represented in the French National Assembly and Senate by one deputy in each. The governor is assisted by a privy council and an elected general council. St. Pierre is the seat of the law courts and of the Apostolic Prefecture. The importance attached to this last foothold in North America has led France to subsidize the islanders, since the meagre local resources cannot support the population. Fishing is the chief occupation based on local resources and it was fishing that first attracted settlement. Those not so engaged work in trade, commerce, or government service. About 2,500 tons of codfish products are exported annually to France and the United States, frozen fillets processed in St. Pierre far outweighing the traditional dried and salted cod. Pelts exported from fox and mink farms are of



ST. PIERRE AND MIQUELON

minor importance, but the tourist trade has become substantial. Improved transport within Newfoundland enables thousands of summer visitors to enjoy the Old World atmosphere of the islands and to buy luxury goods at low prices because of the partial exemption of customs duties.

Supply ships from France and from the Canadian mainland serve the islands. Regular services connect with Sydney and Halifax, Nova Scotia, and scheduled air services with Sydney and with St. John's, Nfd. There are telegraph and telephone communications with Europe and North America.

SAINT-QUENTIN (ancient AUGUSTA VIROMANDUORUM), an industrial town of northern France, capital of an *arrondissement* in the *département* of Aisne, 32 mi. (51 km.) NNW of Laon by rail. Pop. (1962) 60,633. The town stands on the right bank of the Somme, at its junction with the Saint-Quentin and Crozat canals.

The collegiate church of Saint-Quentin (12th–15th centuries), damaged during World War I and reopened in 1920, contains the tombs of Gaius Quintinus (from whom the town takes its name), Victoricus, and Gentianus, all of whom suffered martyrdom in the town in the 3rd century. The *hôtel de ville* is a Gothic building of the 14th–16th centuries, adorned with curious sculptures. The Musée Lécuyer houses pastels by Quentin de la Tour, born in the town in 1704. The Musée d'Entomologie is one of the most remarkable in Europe.

Saint-Quentin is the seat of a subprefect, of a tribunal of commerce, of a board of trade arbitrators, and a chamber of commerce. The town, centre of a district which manufactures cotton and woolen fabrics, expanded rapidly after 1947. Iron goods, machinery, and chemicals are also produced.

The date of the founding of the bishopric is uncertain, but *c.* 530 it was transferred to Noyon. St. Eloi (Eligius; d. 660), bishop of Noyon, established a collegiate chapter at St. Quentin's tomb, which became a famous place of pilgrimage. Its cloth manufacture also made the town important during the Middle Ages. In the 9th century it became the headquarters of the comtes de Vermandois, and in 1080 received a charter from Herbert IV, which was extended in 1103. United to the royal domain in 1191, Saint-Quentin, with other districts of Picardy, was ceded to the Burgundians in 1435 but was reunited to the crown in 1477. In 1557 it was the site of a Spanish victory against the French. During the Franco-German War, Saint-Quentin withstood the German attacks of October 1870; and in January 1871 it was the centre of the great battle fought by General Faidherbe against the German 1st Army. In World War I the Battle of Saint-Quentin (September–October 1918), an attack by the British 3rd, 1st, and 4th Armies against the German position, resulted in a British breakthrough, a final disaster for the Germans which caused them to propose an armistice.

SAINT-RÉAL, CÉSAR VICHARD, ABBÉ DE (d. 1692), French man of letters whose lively writings did much to bring about a new view of history and entitle him to be regarded as a forerunner of Montesquieu and of Voltaire. Born in Savoy (after 1638; perhaps in 1643 or 1644), the son of a magistrate, he went to Paris about 1663. Gabriel Guéret, in 1669, could describe him as the constant counselor of Racine and Boileau and as being regarded in their circle as an authority on literary taste. In 1674, however, he returned to Savoy and attached himself to the errant duchess Mazarin (Hortense Mancini), whom in 1676 he followed to England and whose reconciliation with the court he tried to negotiate on his return to France. He died in Chambéry in September 1692.

Saint-Réal is said to have been a man of original views, great powers of persuasion, and doubtful morals. His views on the real motives of human activity resemble La Rochefoucauld's, and his treatise *De l'usage de l'histoire* (1671) suggests that he had absorbed a reverence for Machiavelli from Italian historiographers. His most popular work was *La Conjuration des Espagnols contre la république de Venise* (1674), which inspired Thomas Otway's *Venice Preserved.* His other works include *Dom Carlos* (1672; one of the sources of Schiller's *Don Carlos*); a remarkable *Vie de Jésus-Christ* (1678); a translation of the first two books of Cicero's letters to Atticus (1691); and numerous further essays on historical subjects. Several collections of his works appeared in the 18th century, the last of them in eight volumes (1757).

See G. Dulong, *L'Abbé de Saint-Réal* (1921); A. Adam, *Histoire de la littérature française au XVII^e siècle,* vol. iv (1954). (W. G. ME.)

SAINTS, BATTLE OF THE, a major British naval victory over the French in 1782 that ended the French threat to the West Indies. The battle was fought in the Saintes Passage between the islands of Dominica and Guadeloupe on April 12, 1782, during the American Revolution. A French fleet of 34 ships under the comte de Grasse, having sailed from Martinique on April 8 to attack Jamaica, was intercepted by a British fleet of 36 ships under Adm. Sir George Rodney (*q.v.*). On April 9 the British van under Rear Adm. Sir Samuel Hood, having caught up with the French rear, was threatened by De Grasse until the arrival of Rodney with the rest of the fleet relieved it. The French withdrew and on the night of the 10th two of their ships were damaged in a collision. To prevent them from falling into the hands of the British, De Grasse altered course so that a general action occurred on the 12th.

The two fleets approached on opposite courses and might have passed each other with the customary ineffective cannonade had not the wind shifted, so that two French ships were taken aback. This accident created two gaps in the French line of battle, into which Rodney, in the "Formidable," steered with the centre division, and Capt. E. Affleck, in the "Bedford," with the rear. A line of battle was thus broken for the first time in nearly a century of naval warfare. The French fleet was scattered, with the result that De Grasse surrendered his flagship, the "Ville de Paris," and many other ships; only comte Louis de Bougainville with the van escaped. The credit for originating this then unorthodox maneuver has been claimed by others, but the completeness of Rodney's victory (although Hood criticized him for not exploiting the pursuit) created a revolution in tactics of which Nelson later made good use.

The victory had an important effect upon the peace negotiations then in progress, which culminated in the Treaty of Versailles (1783): Britain regained most of its islands in the West Indies and kept Canada and India, though the American colonies were lost.

SAINT-SAËNS, CHARLES CAMILLE (1835–1921), French composer, pianist, and organist known for his symphonic poems and his opera, *Samson et Dalila.* Born on Oct. 9, 1835, in Paris, he studied the piano with C. M. Stamaty and gave his first recital as a child prodigy in 1846. At the Paris Conservatoire he studied the organ under F. Benoist and composition under J. F. Halévy. His First Symphony was performed in 1853. He was appointed organist at the church of Saint-Merry in Paris, in the same year, and at the Madeleine in 1857. About this time he met Liszt who described him as "the finest organist in the world." From 1861 to 1865 he was professor of piano at the École Niedermeyer where his pupils were Gabriel Fauré and André Messager. In 1865 he played his First Piano Concerto at Leipzig, and in 1871, after the Franco-German War, he founded, with the singer, Romain Bussine, the Société Nationale de Musique, with the motto, *Ars Gallica,* which pro-

RADIO TIMES HULTON PICTURE LIBRARY

CHARLES CAMILLE SAINT-SAËNS

moted performances of the main French orchestral works of the following generation. In the same year he produced his first symphonic poem, *Le Rouet d'Omphale;* other later symphonic poems were *Phaëton, Danse Macabre,* and *La Jeunesse d'Hercule.* Following the production of his first operas, *La Princesse jaune* (1872) and *Le Timbre d'argent* (1877), his biblical opera, *Samson et Dalila,* rejected in Paris on account of its subject, was given in German at Weimar on Dec. 2, 1877, on the recommendation of Liszt. Despite its success, the prejudice in France and elsewhere against the portrayal of biblical characters on the stage persisted, and early performances in London, New York, and Brussels had to be given in concert form. It was first given in Paris on the stage on Oct. 31, 1890, at the Théâtre Eden, and subsequently became Saint-Saëns' most popular dramatic work.

In 1878 Saint-Saëns lost his elder son, who fell to his death from a window, and six weeks later his younger son died in infancy. It is possible that he imputed these tragedies to his wife's negligence: certainly he separated from her three years later, and undertook over the following years extensive tours throughout Europe, the United States, South America, the Near East and the Far East. On these tours he played the piano in the performances of his five concertos and other works and conducted his symphonic works. As a pianist he was admired by Wagner for his brilliant technique and was the subject of a study by Marcel Proust. From about 1880 until the end of his life his large number of works covered all fields of dramatic and instrumental music. Between 1879 and 1911 he wrote ten operas, including *Henry VIII, Les Barbares,* and *Déjanire,* and between 1915 and 1921 a series of works for wind instruments and piano. His Third Symphony (1886), dedicated to the memory of Liszt, shows a romantic tendency. The *Carnaval des Animaux* for small orchestra, written in 1886 but not publicly performed in his lifetime, is a humorous work with realistic effects, conceived as "a zoological fantasy." *Africa,* for piano and orchestra (1891), and the *Caprice Arabe,* for two pianos (1894), show an Oriental influence. Among the best of his later works are the Fifth Piano Concerto (1896) and the Second Cello Concerto (1902). He gave his last concert in Dieppe in 1921, and died in the same year at Algiers, on Dec. 16.

Under the influence of Liszt, Saint-Saëns developed the symphonic poem and wrote for the piano in an elegant, virtuoso style. The clarity of his orchestration long remained a model. Though he lived through the period of the Wagnerian influence he remained unaffected by it, adhered to the Classical models, and upheld a conservative ideal in French music, admired for its polished craftsmanship and sense of form. In his essays and memoirs he described the contemporary musical scene in a shrewd and often an ironic manner.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845–1933), English man of letters notable for his extensive knowledge of French and English literature, his vigorous style, and his voluminous output, was born at Southampton on Oct. 23, 1845, and educated at King's College School, London, and at Merton College, Oxford. After some years as classics master at Elizabeth College, Guernsey (1868–74), and as headmaster of the Elgin Educational Institute (1874–76), he became a journalist, writing particularly for the *Saturday Review.* From 1895 to 1915 he was professor of rhetoric and English literature at Edinburgh University.

The breadth of his interests is illustrated by the titles of some of his books: *Short History of French Literature* (1882); *Short History of English Literature* (1898); *History of Criticism and Literary Taste in Europe* (1900–04); *History of English Prosody* (1906–10); *History of English Criticism* (1911); *The Peace of the Augustans* (1916); *History of the French Novel* (1917–19); *Notes on a Cellar Book* (1920). He contributed many articles to the 11th edition of the *Encyclopædia Britannica.* He died at Bath on Jan. 28, 1933.

See A. B. Webster, *George Saintsbury* (1933); *George Saintsbury: the Memorial Volume,* ed. by A. Muir *et al.* (1945).

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760–1825), French social reformer and one of the founders of Socialism (*q.v.*). Grandnephew of the memorialist the duc de Saint-Simon (*q.v.*), he was born in Paris on Oct. 17, 1760. He fought in the American War of Independence, was imprisoned in the Palais de Luxembourg during the Terror, and, after his release, amassed a small fortune by land speculation. He was also the originator of schemes to unite the Atlantic and Pacific by a canal, and to construct a waterway from Madrid to the sea. He continued his experiments throughout his life with the result that he was completely impoverished. In 1823 he attempted suicide. He died two years later, on May 19, in Paris. Despite being prolific, his work attracted little attention during his lifetime, and it was only after his death that his influence became considerable.

HENRI DE SAINT-SIMON, 19TH-CENTURY LITHOGRAPH BY L. DEYMARU

As a thinker Saint-Simon was deficient in system, clearness, and coherence; but his influence on modern thought is undeniable. He suggested, for example, much of what was afterward elaborated into Comtism (*see* COMTE, AUGUSTE). Apart from the details of his socialistic teaching, his main ideas are simple and are a reaction against both the French Revolution and the militarism of Napoleon. So far was he from advocating fresh social revolt that he appealed to Louis XVIII to inaugurate the new order of things. In opposition, however, to the feudal and military system, he advocated an arrangement by which the industrial chiefs should control society. The spiritual direction of society should fall to the men of science, who would thus take the place occupied by the church in the Middle Ages. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war, and society should be organized for productive labour by the most capable men. The aim of society should be to produce things useful to life.

Although the contrast between labour and capital is not emphasized by Saint-Simon, the cause of the poor is discussed, and in his greatest work, *Nouveau Christianisme* (1825), it takes the form of a religion. It was this development of his teaching that occasioned his final quarrel with Comte. Before the publication of *Nouveau Christianisme,* Saint-Simon had not concerned himself with theology; but here, beginning with a belief in God, he endeavours to resolve Christianity into its essential elements, and finally propounds this precept—"The whole of society ought to strive toward the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the way best adapted for attaining this end." This became the watchword of the entire school of Saint-Simon.

Saint-Simonians.—Of the disciples who propagated his doctrines the most important were Olinde Rodrigues (1794–1851) and Prosper Enfantin (*q.v.;* 1796–1864), who had received Saint-Simon's last instructions. Their first step was to establish in 1825 a journal, *Le Producteur,* but it was discontinued in 1826. The sect, however, had begun to grow, and, before the end of 1828, had meetings not only in Paris but in many provincial towns. An important departure was made in 1828 by Saint-Amand Bazard (1791–1832), who gave a "complete exposition of the Saint-Simonian faith" in a long course of public lectures in Paris (1828–30), which were well attended and won more adherents. The revolution of July 1830 brought a new freedom to the socialist reformers. A proclamation was issued demanding the community

of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of *Le Globe* through Pierre Leroux (*q.v.;* 1797–1871), who had joined the school, which by this time included some of the ablest and most promising young men of France.

The Saint-Simonians formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, the sect was split by dissensions between Bazard, a man of logical and solid temperament, and Enfantin, who wished to establish a fantastic sacerdotalism with lax notions about the relationships between the sexes. After a time Bazard seceded, with many of the strongest supporters of the school. A series of extravagant entertainments given by the society during the winter of 1832 reduced its financial resources and discredited it. The Saint-Simonians finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress. Shortly after, the chiefs were tried and condemned for proceedings offending against the social order; and the sect was broken up (1832). Many of its members became famous as engineers, economists, and men of business.

Saint-Simonism.—In the doctrine of Saint-Simon's followers there is a great advance on the confused views of Saint-Simon himself. In the philosophy of history they recognize epochs of two kinds, the critical or negative, and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism, and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion, and association. The two spirits of antagonism and association are the social principles whose prevalence determines the character of an epoch. The spirit of association, tending more and more to prevail over that of antagonism, is to be the keynote of the social development of the future. Under the prevailing system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms or starve. The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, entrusting to social groups and social functionaries the management of the various properties, and the right of succession is transferred from the family to the state.

The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a special and pronounced feature of Saint-Simonian socialism. Its theory of government is a kind of spiritual or scientific autocracy, degenerating into the excessive sacerdotalism of Enfantin, the "pope" of Saint-Simonism. With regard to the family and the relation of the sexes the school of Saint-Simon advocates the complete emancipation of woman and her entire equality with man. The "social individual" is man-and-woman, associated in the exercise of the triple function of religion, the state, and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so greatly emphasized by the Catholic Church in its system of penances and mortifications, and held that the body should be given its due place of honour.

BIBLIOGRAPHY.—*Works and Editions:* Important works are *Lettres d'un habitant de Genève à ses contemporains* (1803), *De la Réorganisation de la société européenne* (1814), *Du Système industriel* (1820–21), *Catéchisme des industriels* (1823–24), and *Nouveau Christianisme* (1825). The standard and most complete edition is *Oeuvres de Saint-Simon et d'Enfantin,* 47 vol. (1865–78). Useful selections are those edited by C. Bouglé (1925), J. Dautry (1951), and, in English, by F. M. H. Markham (1952).

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE (1675–1755), French soldier and diplomatist, remembered for his outstanding memoirs, was born in Paris on Jan. 15, 1675, the only son of an aged noble raised to the peerage by Louis XIII. Physically unattractive, he had a violent, vindictive temper and a bitter tongue, along with great charm, a lively intelligence, independence of judgment, and unassailable moral principles, supported by deep religious convictions.

His immense pride of birth and rank was in part responsible for the disappointments of his career. This opened auspiciously in 1691 with honourable service in the army, but Saint-Simon quickly jeopardized his future by plain speaking and tactless opposition to Louis XIV on a point of precedence; he was against "the bastards' " (*i.e.,* the illegitimate sons of Louis XIV) having precedence of the peers. For several years the king refused to employ him, and only ambition and his wife's success at court prevented him from retiring in disgust to his large but financially embarrassed estates. His position improved momentarily through his connection with Louis, duc de Bourgogne, who became heir to the throne in 1711 and the centre of a liberal, aristocratic reform group, including Fénelon. Unhappily, the Dauphin died suddenly a year later, and Saint-Simon then attached himself to the future regent, Philippe, duc d'Orléans, whose dissolute private life had not impaired their long friendship. After Louis XIV's death in 1715, Saint-Simon might have played the decisive political role to which he aspired, but the regent found him unrealistically obsessed with the social and political prerogatives of the peerage and increasingly ignored his advice. He nevertheless appointed him to the council of regency and in 1721 sent him as ambassador to Spain to negotiate a marriage between Louis XV and the Infanta. Saint-Simon realized that his influence was waning, and with the death of Orléans on Dec. 2, 1723, he retired into private life. Until he died in Paris on March 2, 1755, he immersed himself in the study of history and the composition of his *Mémoires* (first published in a reliable, complete text in 1829–30).

The idea of leaving some such record of his life and times had been in Saint-Simon's mind since 1694, and after keeping a fragmentary diary he had collected miscellaneous material concerning current events. In 1729 there came into his hands a manuscript copy of the *Journal* of the marquis de Dangeau. (Philippe de Courcillon), which he was prompted to annotate and which provided him with a chronological framework when, some ten years later, he began, instead, to compose his own memoirs.

The last part of the work, dealing with the period 1723–43, has been lost. The text that has survived covers the years 1691–1723. It is a composite narrative for which Saint-Simon draws on his own memories and papers, on oral and written information supplied by participants and witnesses of all ranks, and on printed and manuscript sources of varying reliability, ranging from the marquis de Torcy's diplomatic papers and standard historical works to Courtilz de Sandras' historical romances. Saint-Simon set himself standards of historical accuracy and impartiality which he did not always observe. He defined his purpose in writing his memoirs as the evocation from within of the living contemporary scene, made intelligible for the edification of posterity. This accounts for his narrative and descriptive detail, his myopic perspective, and his failure to disentangle fundamental causes and events and to establish the true pattern of contemporary history. Living at court in the complex tangle of personal and family relationships which complicated the struggle for preference and power, Saint-Simon almost inevitably overemphasized matters involving personalities and petty intrigue. Convinced that the disorders of Louis XIV's reign were caused by the development of royal absolutism and in particular by the whittling away of the

political power of the peerage, it was almost equally inevitable that he should be preoccupied with the niceties of ceremonial, etiquette, and precedence which in his day constituted the essential outward symbols of the realities of power. Nor must impartiality be expected from Saint-Simon, whose estimate of persons and events was often distorted by vanity, disappointment, and personal and political prejudice.

Despite these shortcomings, Saint-Simon's work is the stuff of which history is made. It unfolds before the enthralled spectator an unforgettable fresco of the later years of Louis XIV's reign and of the regency. The wealth of information is staggering; the vividness with which Saint-Simon conjures up the past has few parallels. He analyzes with the pitiless accuracy and penetration of a Racine the traits and motives of his fellow actors; with no less virtuosity and deadly concision he can etch in the physical characteristics that mirror a man's soul. Dislike produces savage, animated caricatures worthy of a Dickens or a Balzac. His style is an admirable instrument for his purpose. It aims not at classical purity but at complete, graphic expression. It is at times incorrect and obscure, but it is normally vigorous and picturesque. Saint-Simon does not recoil before the familiar or the archaic word or expression, nor does he hesitate to adopt a neologism or to coin a phrase. His *Mémoires* are probably the greatest of those for which France is justly renowned.

BIBLIOGRAPHY.—The definitive edition of the *Mémoires* is by A. de Boislisle, 43 vol. (1879–1928); a convenient edition is that by G. Truc, in the "Pléiade Series," 7 vol. (1947–64). *See* also *Memoirs of the Duc de Saint-Simon*, selections ed. by W. H. Lewis (1964).

SAINT THOMAS, a city and port of entry of Ontario, Can., the seat of Elgin County, is on Kettle Creek, midway between Windsor and Niagara Falls. Pop. (1961) 22,469. It was founded about 1810 under the name of Stirling and renamed after Col. Thomas Talbot who made it the capital of the extensive settlement he had founded in 1803. It is a railway division point. Manufactures include roller and powdered metal bearings, heavy-duty tractors, electric motors, truck-mounted concrete mixers, auto and airplane accessories, gaskets, vitrified tile, and metal signs. Educational facilities include Alma College (established 1878), a junior college for women, affiliated with the University of Western Ontario at London. A large publicly owned arena offers year-round ice skating and hockey-training schools. (T. KE.)

SAINT THOMAS ISLAND (ILHA DE SÃO TOMÉ): *see* SÃO TOMÉ E PRÍNCIPE.

SAINT THOMAS ISLAND, the most important, commercially, of the Virgin Islands purchased by the United States from Denmark in 1917. Pop. (1960) 16,201.

Saint Thomas lies 40 mi. (64 km.) east of Puerto Rico, 1,442 mi. SE of New York City and 1,020 mi. from the Panama Canal. It is 14 mi. (23 km.) long, has a width of 2 mi. (3 km.), and has an area of 32 sq.mi. (83 sq.km.). It is of volcanic origin. The main ridge, peaks of a submerged range, extends east and west the length of the island. Its hills are steep and rocky and sparsely covered with vegetation, the original timber having been cut away for lumber and charcoal. Two summits, Crown Mountain and Signal Hill, rise above 1,500 ft. Many of the spurs of the ridge slope down to the shore and form protected bays where the buccaneers of the 17th and 18th centuries found refuge.

The climate of the island is salubrious, particularly during the first quarter of the year when the trade winds blow. The mean temperature is 78° F (25.6° C), the thermometer rarely falling below 64° (17.8°) and rarely rising above 91° (32.8°). The average rainfall is 38.23 in. (971.04 mm.); the driest weather is in March and the rainy season in October and November. Drinking water is stored in cisterns because of the dearth of wells.

After the abolition of slavery in 1848, agriculture became decadent. Destruction of the once profitable rum export trade as a result of prohibition of liquor in the United States contributed heavily to economic decline. From 1926 to 1933 the annual federal government contribution to the municipal treasury of the U.S. Virgin Islands averaged around $100,000; however, gradual improvement was made after 1931. By the early 1960s federal contributions to grant-in-aid programs had increased to more than $650,000.

Improved hotels and a stimulation of the tourist trade, along with governmental encouragement of small landholdings, were important among the economic developments. There is an agricultural experimental station at Estate Dorothea. Most of the island's agricultural and dairy produce is for local consumption and ship supplies. Native handicraft work and rum distilleries provide the chief direct exports.

St. Thomas Island was discovered and named by Christopher Columbus on his second voyage in 1493. The first colony was planted in 1657 by the Dutch who soon after abandoned it and migrated to New Amsterdam (New York). The Danes arrived and took formal possession in 1666, but their first colony also failed. The Danish West India company dispatched an expedition under Gov. Jorgen Iversen which landed in St. Thomas harbour on May 25, 1672, and effected a permanent settlement. Later Huguenot refugees from St. Kitts were granted asylum.

In 1755 the king of Denmark acquired the company's rights and made the harbour a free port. The island was temporarily seized by England in 1801–02, and again held in 1807–15, but was restored to and held by Denmark until 1917, when it was sold to the United States.

The chief value of the island is the harbour of Charlotte Amalie, one of the best in the Antilles, important as a United States naval base. It is perfectly landlocked, with a bottlenecked entrance, and has a deserved reputation for refuge. It commands the gateway to the Caribbean through the Virgin passage and is a port of call for passenger steamers from New York and European ports bound for the Panama canal and Central America via the Lesser Antilles. There are ample coaling facilities, oil reservoirs, shipyards and machine shops, floating docks and wharves with electric cranes.

Charlotte Amalie, pop. (1960) 12,880 (known as St. Thomas city from 1917 to 1932), the seat of government of the Virgin Islands, lies on three low spurs of the island ridge; the spurs are dubbed Foretop, Maintop and Mizzentop. A single level street parallel to the water front forms a common base for three cone-shaped clusters of white dwellings on the green background of the ridges. Government hill is one of the attractive residential sections, the location affording constant enjoyment of the breezes and panorama. The population is predominantly Negro, but there is a considerable minority group of French-Norman origin who have lived there for many generations. English is the prevailing language, but Danish, Dutch, French and Spanish are also common. Air services connect with all parts of the Caribbean.

For general government, *see* VIRGIN ISLANDS. (M. F. DE C.)

SAINT VINCENT, JOHN JERVIS, EARL OF (1735–1823), British admiral who won fame as a commander at the battle of St. Vincent (1797) (*q.v.*), was born at Meaford, Staffordshire, on Jan. 9, 1735. He entered the navy on Jan. 4, 1749, and became lieutenant on Feb. 19, 1755; he served in that rank till 1759, taking part in the conquest of Quebec. He was made commander of the "Scorpion" sloop in 1759, and post captain in 1760. During the peace he commanded the "Alarm" (32 guns) in the Mediterranean, and when he was put on half pay he traveled in Europe, taking professional notes everywhere. While the American Revolutionary War lasted, he commanded the "Foudroyant" (80) in the English channel, taking part in the battle of Ushant (1778) and in the various reliefs of Gibraltar. His most signal service was the capture (April 19, 1782) of the French "Pégase" (74) after a long chase.

In 1783 he entered parliament as member for Launceston, and in the general election of 1784 as member for Yarmouth. In politics he was a strong Whig. On Sept. 24, 1787, he attained flag rank, and was promoted vice-admiral in 1793. From 1793 to 1795 he was in the West Indies co-operating with the army in the conquest of the French islands. On his return he was promoted admiral. In Nov. 1795 he took command in the Mediterranean,

where he maintained the blockade of Toulon, and aided the allies of Great Britain in Italy.

But in 1796 the occupation of Italy by the French armies closed all the ports to his ships, and Malta was not yet in the possession of Great Britain. Then the addition of the Spanish fleet to the French altered the balance of strength in the Mediterranean. The Spaniards were very inefficient and Jervis would have held his ground if one of his subordinates had not taken the extraordinary course of returning to England because he thought that the dangerous state of the country required that all its forces should be concentrated at home. He was therefore obliged to act on the instructions sent to him and to retire to the Atlantic, withdrawing the garrisons from Corsica and other places. His headquarters were now on the coast of Portugal, and his chief duty was to watch the Spanish fleet at Cadiz. On Feb. 14, 1797, he gained a complete victory against heavy odds. (*See* SAINT VINCENT, BATTLE OF.) For this victory, which came at a critical time, he was made an earl and was granted a pension of £3,000.

St. Vincent's qualities as a disciplinarian were soon to be put to a severe test. In 1797 the grievances of the sailors, which were of old standing, and had led to many mutinies of single ships, came to a head in the great general mutinies at Spithead and the Nore. Similar movements took place on the coast of Ireland and at the Cape of Good Hope. The spirit spread to the fleet under St. Vincent, and there was a danger that some outbreak would take place in his command. The peril was averted, however, by enforcement of the strictest discipline. St. Vincent had always taken great care of the health of his men, and was as strict with the officers as with sailors. He carried his strictness with his officers to an extent which aroused the actual hatred of many among them, and exasperated Sir John Orde (1751–1824) into challenging him to fight a duel. Yet he has been credited with having raised the discipline of the navy to a high level. His health broke down and in June 1799 he resigned his command.

When St. Vincent's health was restored in the following year he took the command of the channel fleet, into which he introduced his own rigid system of discipline to the bitter anger of the captains. But he was able to maintain the blockade of Brest for 121 days with his fleet. In 1801 he became first lord and held the office till William Pitt returned to power in 1803. His administration is famous in the history of the navy, for he now applied himself to the task of reforming the corruptions of the dockyards. He was fiercely attacked in and out of parliament, and he gave an opening to his critics by devoting himself so wholly to the reform of the dockyards that he neglected the preparation of the fleet for war. He would not recognize the possibility that the peace of Amiens would not last. Pitt made himself the mouthpiece of St. Vincent's enemies, mainly because he considered him as a dangerous member of the party which was weakening the position of England in the face of Napoleon. When Pitt's second ministry was formed in 1803, St. Vincent refused to take the command of the channel fleet at his request. After Pitt's death he resumed the duty with the temporary rank of admiral of the fleet in 1806, but held it only until the following year. After 1810 he retired to his house at Rochetts in Essex.

The rank of admiral of the fleet was conferred on him in 1821 on the coronation of George IV, and he died on March 14, 1823.

(D. H.; X.)

SAINT VINCENT, a British colony, an island of the Lesser Antilles in the Caribbean Sea, forming part of the Windward Islands group, lies about 25 mi. (40 km.) SW of St. Lucia and about 100 mi. (160 km.) W of Barbados. St. Vincent is 18 mi. (29 km.) long, has a maximum width of 11 mi. (18 km.) and an area of 133 sq.mi. (344.5 sq.km.). For administrative purposes most of the Grenadine Islands (*q.v.*) are included in St. Vincent, giving the territory a total area of 150 sq.mi. (388.5 sq.km.).

Running from north to south, thickly wooded volcanic mountains, from which flow many short swift streams, form the backbone of the island. The highest peak is the volcano Soufrière (4,018 ft. [1,224.7 m.]) in the north, which erupted disastrously in 1821 and 1902. St. Vincent lies in the path of the northeasterly trade winds and has a tropical maritime climate. Rainfall and temperature vary with altitude. Average annual rainfall ranges from 50 in. (1,270 mm.) on the coast to 150 in. (3,810 mm.) in the central mountains. The temperature averages between 19.4° C (67° F) and 31.7° C (89° F). Hurricanes usually pass north of St. Vincent, but the island suffered severely in 1780 and 1898.

At the 1960 census the population of St. Vincent was 79,948. About 75% of the inhabitants are Negroes, 2½% are whites, and the rest are of mixed or of East Indian extraction; only a few are of pure Carib Indian stock. The capital and chief port is Kingstown, on the southwest coast, with a population (1960) of 4,556. In the mid-1960s there were more than 50 primary schools, 5 secondary schools, and 4 teacher-training establishments. Primary education is free but not compulsory.

St. Vincent's system of government is ministerial. The executive council consists of four elected members (including the chief minister and three other ministers), one nominated member, and one official member. The council is presided over by an administrator, who is appointed by the U.K. government. The legislative council, which has an elected majority, is presided over by a speaker elected by the council.

St. Vincent's economy is agricultural. Traditional crops are arrowroot (of which the colony is the chief world exporter) and sugarcane, but in the late 1950s bananas became the leading export and by the early 1960s comprised about 50% of the total value of exports. Other crops include coconuts, cotton, cassava, groundnuts (peanuts), and sweet potatoes. The chief imports are food, clothing, cement, timber, and gasoline (petrol). The unit of currency is the West Indian dollar with a par value of WI$1.714 to the U.S. dollar. The annual value of imports in the mid-1960s was about WI$12,600,000, and of exports about WI$5,600,000. Nearly half the island is forested, the woodland being used for charcoal burning. Arrowroot and sugar are processed, and soap and edible oils are produced. A limited air service operates from an airfield at Arnos Vale. Two ships, which run between Jamaica and Trinidad, provide a weekly cargo and passenger service.

The date of the discovery of St. Vincent is not known; it is thought that the island may have been given its name by Columbus. Its Carib inhabitants were left almost undisturbed until the 18th century. French, Dutch, and British settlements were attempted, with the French dominant until the Seven Years' War, when British Gen. Robert Monckton occupied it (1762). The Treaty of Paris (1763) confirmed British possession, and settlement proceeded in spite of Carib refusal to accept British sovereignty. In 1779 the island was seized by the French, but it was restored to Britain in 1783. In 1795 the Caribs rose in revolt, assisted by the French from Martinique, but were finally subdued the following year. Most of them were then deported to the Islas de la Bahía (Bay Islands) off Honduras. The emancipation of Negro slaves in 1834 disrupted the island's economy by decreasing the labour supply, and Portuguese and East Indian labourers were introduced later in the century.

In 1958 St. Vincent joined the Federation of The West Indies. In 1960 it received a new constitution. When the Federation was dissolved in 1962, the colony planned to join the other Windward Islands and the Leeward Islands in a smaller federation. In November 1964 agreement on the establishment of a new West Indies federation was reached by the regional council of ministers of the "little seven"—Barbados, Antigua, Dominica, Montserrat, Saint Kitts-Nevis, Saint-Lucia, and Saint-Vincent. *See* also WEST INDIES; WEST INDIES (FEDERATION), THE.

(R. To.)

SAINT VINCENT, BATTLE OF, a famous British naval victory fought off Cape St. Vincent, Portugal, on Feb. 14, 1797, between an English fleet under Admiral Sir John Jervis and a superior Spanish fleet. At that time Spain, which was allied to Revolutionary France, had a force of 27 ships at sea under Don José de Córdoba. Jervis, whose fleet was based on the Tagus River, kept continuous watch for the Spaniards off Cadiz, for which port they were making. When sighted off Cape St. Vincent the Spaniards were in two divisions. Although Jervis had with him only 15 ships of the line, he did not hesitate to give battle. He formed single line ahead and steered to pass between the two groups. He then intended to turn and destroy the larger group. He left the signal

late, but Nelson, who was flying a commodore's pennant in the "Captain," which was third from the rear of the British line, anticipated his commander in chief's orders, made a sweep to the rear, and attacked a number of Spanish ships which he saw might otherwise escape. He was supported by Capt. Cuthbert Collingwood in the "Excellent," Capt. Thomas L. Frederick in the "Blenheim," Capt. Thomas Troubridge in the "Culloden," and by other ships. As a result of this initiative, four fine prizes were taken: the "San Josef" and the "Salvador del Mundo," which were larger than most British "first-rate" ships, the "San Nicolas," and the "San Ysidro." The huge "Santissima Trinidada" was thought to have struck her flag, but she managed to escape. Jervis lost no ships, and suffered only about 300 casualties. There were more than 600 casualties in the prize ships, and the Spaniards admitted to 200 more in the "Santissima Trinidada" alone.

The victory heartened Great Britain at a time when she had no effective allies. Jervis was created an earl and took his title from the scene of the action. Nelson was created a Knight of the Bath and gained wide renown for his personal exploits in boarding the "San Nicolas" and the "San Josef." The battle showed the ineptitude of the Spanish leaders and their shortage of skilled manpower; all their ships were short of complement and the guns were manned by soldiers. It prepared the way for Britain's reentry into the Mediterranean, from which her fleet had temporarily been driven by French successes in Italy.

Several previous battles had been fought in the 18th century at Cape St. Vincent, including one in 1780 won by Adm. George Rodney (*q.v.*).

BIBLIOGRAPHY.—*A Narrative of the Proceedings of the British Fleet,* an eye-witness account by Col. Drinkwater Bethune, was published anonymously in 1797; *Dispatches and Letters of Nelson,* with notes by Sir N. H. Nicolas, vol. ii (1845); C. C. Lloyd, *St. Vincent and Camperdown* (1963). (O. M. W. W.)

SAINT VINCENT, CAPE (CABO DE SÃO VICENTE), forms with Sagres Point a promontory in the extreme southwest portion of Portugal. It was referred to by Strabo as the "most westerly point not only of Europe, but of all the inhabited world." To the Greeks and Romans it was known as the Sacred Promontory owing to the presence there of a shrine. Near Sagres was the town Vila do Infante where (*c.* 1420) Henry the Navigator formed a naval observatory and a school for navigators. Nearby were won the naval victories of Sir John Jervis, with Horatio Nelson, in 1797 (*see* SAINT VINCENT, BATTLE OF), and of Sir Charles Napier (*q.v.*) in 1833.

The promontory consists of differentially eroded hard Liassic and Malm dolomites, separated by soft marls. The coastal formation has also been influenced by faults; the cliffs rise 160–230 ft. (50–70 m.) from sea level to a plateau planed by marine abrasion. The climate is humid, subtropical, and windy. Vegetation consists of an extensive cover of gum cistus and other shrubs. Pastoralism and fishing are the mainstay of this desolate district; Sagres is the main settlement. (J. M. Ho.)

SAINT VITUS' DANCE: *see* CHOREA.

SAIONJI KIMMOCHI, PRINCE (1849–1940), Japanese statesman who tried to moderate the nation's then increasing militarism, was born in October 1849 in Kyōto. The son of an imperial noble, Tokudaiji, he was adopted as heir of the Saionji family in 1852. After nominal participation in the movement that led to the restoration of imperial rule in the 1860s, he studied in France until 1881. Holding thereafter many high governmental posts at home and abroad, he was prime minister in 1901–02, 1906–08, and from 1911 until 1912, when he removed himself from public party politics and government office, though he headed Japan's delegation to the Conference of Paris in 1919.

For the last 25 years of his life, Saionji's power stemmed from his position as genro, or elder statesman, an honour reserved for a small group of political leaders who had both participated in the imperial restoration of 1868 and had also been prime minister. As such, he was a close and trusted advisor of the emperors. Consulted on matters of highest state policy, he was particularly influential in recommending the imperial appointments of prime minister. He was considered a liberal during his entire career and often exercised a moderating influence upon ultranationalistic and militaristic trends. After the occupation of Manchuria in 1931–32 fanatic extremists frequently sought to assassinate him. He died, "the last genro," on Nov. 24, 1940. (HN. KN.)

SAIS, the Greek form of the name of the ancient Egyptian city Sai, in the delta on the Canopic or Rosetta branch of the Nile. From prehistoric times it was the location of the chief shrine of the warrior goddess Neith, who was also worshiped as the creatrix who wove the world on her loom. The city became politically important late in its history. Tefnakhte of Sais was defeated by the Napatan Piankhi, but Tefnakhte's son Bocchoris, whom Manetho accounts the only ruler of the 24th dynasty, regained control of lower Egypt for six years till slain by Shabaka. When Assyria defeated the Napatans, Saite princes, as Assyrian vassals, gained control of the delta once more and after expelling his masters, Psamtik I (663–610 B.C.) won for himself all Egypt. Under this pharaoh and his successors of the 26th dynasty, Sais was the capital. (*See* also EGYPT: *History: Ancient Period.*) Enriched by Mediterranean and African trade, the Saite kings lavished their wealth on temples and palaces and built near them their tombs. In Herodotus' day Sais was still one of the finest cities in Egypt. Like many Greek visitors, he stayed there, and the priests of the Temple of Neith were his informants.

Known in modern times as Sa al Hajar (Sa el-Hagar), the extensive and imposing mound has been little explored, though very much denuded since it was first described by J. F. Champollion in 1818. Inscribed stones found on the site and in nearby villages are all that remains of this once-great city.

See Herodotus, Book ii, 62, 163, 169–171, 175–176; L. Habachi, "Sais and Its Monuments," in *Annales du service des antiquités de l'Égypte,* vol. xlii, pp. 369–416 (1943). (M. S. DR.)

SAISSET, BERNARD (*c.* 1232–*c.* 1311), the first bishop of Pamiers (southern France), was an aggressive and outspoken prelate whose activities exacerbated the disputes between Pope Boniface VIII and Philip IV of France. Of a noble Toulousain family, Saisset became an Augustinian canon and in 1267 was elected abbot of Saint-Antonin at Pamiers.

Saisset was involved in two major incidents. The first was a dispute over control of the town of Pamiers, originally shared between the abbey and the counts of Foix (*q.v.*). The count's authority had recently been exercised by the crown, but Philip IV restored it to Count Roger Bernard III (February 1295). At this point Saisset was made bishop of Pamiers (July 1295), the pope carving for him a diocese from the territory of that of Toulouse. Eventually a compromise was negotiated between count and bishop (December 1297) and they were formally reconciled (June 1300).

Soon afterward, Saisset was denounced to the king as a traitor, probably by the bishop of Toulouse. Two royal officials took evidence (May 1301) from more than 20 people, including Roger Bernard. In July Saisset was summoned to appear before the king, his goods were sequestrated, and some of his servants imprisoned. At Senlis (October 1301) he was charged with treasonable utterances, plotting with Aragon and England against Philip, and with simony, heresy, and blasphemy. Philip communicated the charges to the pope; but the latter also heard of the violence done in this case to the persons and property of churchmen, and ordered Saisset's release. For the subsequent quarrel between king and pope, *see* PHILIP IV. Expelled from Philip's kingdom (February 1302), Saisset went to Rome but was apparently back in Pamiers late in 1305. He died probably in December 1311.

See J. M. Vidal, *Histoire des évêques de Pamiers,* vol. i (1926); G. Digard, *Philippe le Bel et le saint siège,* 2 vol. (1936).

SAITAMA, a Japanese prefecture (*Ken*) north of Tokyo, with an area of 1,468 sq.mi. and a population (1960) of 2,430,871. Its level land areas are extensive and the ratio of cultivated area (38%) is the highest among the prefectures. Horticultural produce for consumption in Tokyo is the characteristic feature of agriculture. The Sayama area produces a choice green tea. The western section is devoted to sericulture. The chief products of manufacturing are textile goods and machinery. Cities in the south, including Urawa, the prefectural capital, have become suburban residential centres for Tokyo commuters.

(R. B. H.)

SAIT FAIK ABASIYANIK (1907–1954), Turkish author, who introduced a new form of short-story writing into Turkish literature. Born at Adapazari and educated in Istanbul and Bursa, he spent four years in France (1931–35), mainly in Grenoble, and on his return began to publish his short stories in *Varlik*, the leading avant-garde periodical. These were in a style new to Turkish literature: shapeless, without definite plot, but gripping, and conveying in a single episode a wide range of human experience.

In 1936 he published his first volume of short stories, *Semaver*. A dozen others followed, including *Lüzumsuz Adam* (1948), *Kumpanya* (1951), *Havuzbashi* (1952), and *Alem Daginda var bir Yilan* (1953). He also experimented with a novel, *Bir Takim Insanlar* (1952), and published a volume of verse. The subjects of his powerful sketches and stories are taken from the life of simple people in humble occupations; his style, though realistic, has an element of poetry. He died in Istanbul, May 11, 1954. (F. I.)

SAKA (SHAKA), a Scythian tribe identified with the Sacae of classical literature and the Sai (Sok) of the Chinese annals, who are often mentioned along with the Yavanas and Pahlavas (Parthians) in Indian literature, originated near the upper reaches of the Ili River, south of Lake Balkhash, but were forced by the Yue-chi (Yüeh-chih; *q.v.*) to move southward *c.* 160 B.C. Passing through Kashgar and crossing the Pamirs, they reached Gilgit and, in course of time, occupied the Swat Valley and Gandhara (Northwest Frontier area), after having overthrown the Indo-Greeks.

Coins and inscriptions show that the earliest king bearing a Saka name in Gandhara was Maues (Mauakes, Moga). He ruled, probably from *c.* 95 to 75 B.C., over Gandhara and contiguous areas. His coins, which consist of more than 20 types of silver and copper, with inscriptions in Greek and Kharosthi, are found in considerable numbers and portray Greek deities; *e.g.*, Zeus, Apollo, Herakles, Poseidon, Artemis, and Nike. Inscriptions dating from Maues' reign have been found in Shahdara, Mansehra, Fatehjang, and Taxila (all in West Pakistan). Soon after Maues' death the Sakas were driven eastward by the Pahlavas. Mathura (in modern Uttar Pradesh) became their new headquarters, and there the Saka kings best known from coins and inscriptions were Rajuvala and Sodasa. Some of the Rajuvala coins found in excavations at Taxila may date from a period when Rajuvala had still some control over that city. Some of the coin inscriptions again are in Greek and Kharosthi, others are in Brahmi only. Similarly, the Indian goddess Lakshmi is depicted on Rajuvala's money in addition to the Greek Pallas Athene and Herakles.

It was in Malwa, however, that the Sakas became firmly established. These Sakas often referred to as the Western Kshatrapas (*i.e.*, satraps), with their capital city at Ujjain, ruled Malwa and parts of Rajputana and Maharashtra for more than 300 years. Theirs is the only coinage series in ancient India which always gives the year of issue and the name of the father of the reigning king and his status. The founder of this house of Saka kings was Cashtana, with whose reign the Saka era, starting from A.D. 78, may be associated (but *see* CHRONOLOGY: *Hindu*). He is generally identified with Tiastenes mentioned in Ptolemy's *Guide to Geography*. The most powerful king of this dynasty was Rudradaman, whose famous Junagadh inscription, dated A.D. 150, noted for its fine Sanskrit prose, describes his military exploits and the steps taken by him to reconstruct the Sudarshana Lake, an irrigation work built by order of Chandragupta Maurya. After Rudradaman the dynasty suffered reverses, but it continued to rule until the end of the 4th century A.D. when Rudrasimha III was overthrown, probably by Chandra Gupta II Vikramaditya.

SAKAI, a city in Ōsaka urban prefecture, Japan. Pop. (1960) 339,863. Many large earthen tomb mounds around the city attest its antiquity; Emperor Nintoku's tomb (1,574 ft. long, 105 ft. high) is the largest in Japan. Sakai was celebrated in the 16th century as the leading eastern inland seaport and was noted for its rich merchants. A shift in the course of the Yamato River silted its harbour, and the city sank in obscurity with the rise of neighbouring Ōsaka to commercial and industrial greatness. Sakai has revived as an Ōsaka industrial satellite since the opening of rail service between the two cities. Machinery, bicycle and automotive parts, fertilizer, *tabi* (cotton socks), dyestuffs, and chemicals are among its chief products. The main industrial belt is located along the coast on reclaimed land, while residential areas spread inland on elevated sites. The port handles an active traffic in small native craft. (J. D. EE.)

SAKE, the national beverage of Japan, is a rice beer, often mistakenly called a wine because of its high alcoholic content, usually 17 to 18%. Brewing of sake dates back many centuries.

Production of sake begins with steamed rice or *koji*, which is mixed with *Aspergillus oryzae*, a specially cultured mold that converts the rice starch into fermentable sugars. Preparation of the *koji* takes place in warm, draft-free cellars. The next step is the mixing together of 36 litres of *koji*, 90 l. of fresh steamed rice, and 108 l. of water. The resulting mass is worked and kneaded by hand for two hours until a smooth, lump-free paste of even consistency is obtained. It is allowed to rest for 24 hours, after which it is put into a large vat containing more steamed rice and water. A wooden or enameled iron bucket 18 in. deep, with a diameter of 12 in. at the top and 8 in. at the bottom, filled with boiling water, is suspended and immersed in the mash, being moved about periodically to heat the mash evenly. A slow, free fermentation occurs over a period of four weeks, the result of which is *moto*, with an alcoholic content of 10½ to 11%. Additional quantities of *koji*, steamed rice, and water are added to the *moto* in the fermenting vat and a new fermentation takes place, lasting seven days. In order to facilitate fermentation a culture of the yeast *Saccharomyces sake* is sometimes added to the fermentation mixture. Lactic acid also may be added, to prevent bacterial contamination. The fresh sake is rested for another week, after which it is filtered and bottled.

The drinking of sake is a delicate, even poetic ceremony. It is always served warm, in tiny porcelain bowls that hold little more than an ounce. It is sipped.

Though each drink of sake is small, consumption in Japan is an important economic factor. The average annual consumption of alcoholic beverages in Japan after World War II was about 350,000,000 U.S. gal., of which sake represented 40%. (H. J. GS.)

SAKHALIN, an island of the U.S.S.R. lying off the far eastern coast between the Tatar Strait and the Sea of Okhotsk. Area 29,300 sq.mi. (76,000 sq.km.) Together with the Kuril Islands (*q.v.*) it forms Sakhalin *oblast* of the Russian Soviet Federated Socialist Republic. Area of *oblast*, 33,600 sq.mi. (87,100 sq.km.). Pop. (1959) 649,405.

Physical Features.—The island is long and narrow, orientated north–south for 589 mi. (948 km.) while the average width is 62 mi. (100 km.). At the nearest point, in the Nevelskogo Strait, the island is only 4 mi. (6.4 km.) from the mainland. The greater part of Sakhalin is mountainous. The main chain is that of the Western Sakhalin Mountains, which extend from the extreme southern tip, Cape Krilon, to approximately 51° 30′ N, although isolated hills continue to Mt. Vagis. This range rises to 4,347 ft. (1,325 m.) in Mt. Zhuravleva. To the east of the range is a tectonic trough, occupied by the south-flowing Poronay and north-flowing Tym. East of the trough is a much shorter, nearly parallel range, the Eastern Sakhalin Mountains, which rise to 5,279 ft. (1,609 m.) in Mt. Lopatin, the highest peak of the island. The northern third of Sakhalin is a hilly lowland, with an isolated group of higher hills on the Shmidta Peninsula at the northern end. The great extent of latitude (over 8°) covered by the island means there is a considerable range of climate, soil, and vegetation. The overall climatic regime is of the cold monsoon type, with onshore summer winds bringing a rainfall of 20–30 in. (510–760 mm.) a year and cool conditions (July average temperatures 15° C [59° F] in the north and 17° C [63° F] in the south). The winter

offshore monsoon brings exceptionally bitter weather for the latitude, ranging from −23° C (−9° to −10° F) January average in the north to −8° C (17° F) in the south. Snowfall is high. The maritime location causes high cloudiness all the year round and a high frequency of fogs in summer. These fogs are encouraged by the meeting of the cold Okhotsk current from the north, which also contributes to severe conditions in northern Sakhalin, and the warm Tsushima current, which modifies the climatic regime of the south. This severe and unpleasant climate brings forest-tundra conditions in the north with stunted forest of birch and willow and much peat bog. The mountains are mostly in taiga of Yeddo spruce and Sakhalin fir. In the south is mixed forest, with a rich variety of eastern deciduous species, such as Manchurian oak and elm and Korean willow. On the west coast wild bamboo is found. Soils are mostly podzolic.

History.—Sakhalin was first settled by Japanese fishermen along the southern coasts. In 1853 the first Russians entered the northern part. In 1855 an agreement with Japan shared control of the island, but in 1875 Russia acquired all Sakhalin in exchange for the Kurils. As a result of the Russo-Japanese War Japan in 1905 (Treaty of Portsmouth) gained Sakhalin south of the 50th parallel and gave this part the Japanese name of Karafuto. In 1918, after the Revolution, the Japanese occupied all Sakhalin, but they withdrew in 1924 and in the following year White Russian forces were driven out of the north by Soviet troops. The Soviet Union regained the southern half in 1945, at the end of World War II, together with the Kurils, and the entire Japanese population was repatriated. In 1932 an *oblast* subordinate to Khabarovsk *krai* had been established in the north; in 1947 the whole island was made a fully independent *oblast*.

Population.—Of the 1959 population, the exceptionally high proportion of 75% was urban, living in 19 towns and 33 urban districts. The large number of urban districts indicates a youthful stage in the development of the island's economy. The largest town is the administrative centre of Yuzhno-Sakhalinsk (formerly Toyohara) with 85,510 people. Other towns are small, the most important being the old administrative centre of Aleksandrovsk-Sakhalinskiy on the west coast, the coal-mining towns of Uglegorsk and Poronaysk, and the oil town of Okha. The overwhelming bulk of the population is formed by Russian settlers, with some Ukrainians and Belorussians. In the north are a few hundred of the indigenous tribes, the Gilyaks (Nivkhi), Evenki, and Oroke.

The Economy.—First place in the economy of Sakhalin belongs to fishing, which is carried on from all the coastal settlements. Crab, herring, cod, and salmon are caught and canned in the larger centres. The annual output exceeds 33,000,000 cans. Second in importance is timber working and many of the southern towns manufacture pulp and paper, notably Yuzhno-Sakhalinsk, Uglegorsk, and Kholmsk. In all there are eight paper mills. Third place is taken by mineral extraction. Deposits of coal are found all along the flanks of the Western Sakhalin Mountains. The main mining centres are Uglegorsk, Shakhtersk, Aleksandrovsk-Sakhalinskiy, and Poronaysk. Although the deposits are small, they form an important source of supply for the Soviet far east. In the extreme north, around Okha, petroleum is obtained and sent by pipeline under the Tatar Strait to the refineries of Komsomolsk-on-Amur and Khabarovsk. As with the coal, the deposits have an importance out of proportion to their small size, because they are the only source of petroleum in the Soviet far east. Small-scale shipbuilding and repair are carried on at Korsakov, in the far south, and Aleksandrovsk-Sakhalinskiy. The severe climate and mountainous relief have caused agriculture to be weakly developed, as the low rural population indicates. Only in the south and in the Tym Valley are limited areas of arable found. By far the greater part is under potatoes; other vegetables, oats, and fodder-maize are the only other significant crops. Pigs and cattle are kept and there are nearly 14,000 head of reindeer. Fur-bearing animals include bears, foxes, otters, and sables; rodents are numerous. Communications are few. In the south railways flank the Western Sakhalin Mountains, extending on the east side as far north as Pobedino. In the north a short line crosses the island through Okha and then runs south along the east coast to Katangli. A motor road runs from north to south through the central trough. There are airfields at Yuzhno-Sakhalinsk and Okha. (R. A. F.)

SAKJEGOZU, a village in a piedmont valley of the Anti-Taurus near Zincirli Huyuk in the Gaziantep *il* of southern Turkey. Sakjegozu first attracted the attention of archaeologists as the source of a Late Hittite slab relief depicting a royal lion hunt, which had been taken from the walls of the village chief's house and placed in the Berlin Museum. There it was noticed by the British archaeologist J. Garstang, who traced its original source to a small mound called Jobba Huyuk, adjacent to the village. Excavations undertaken on this mound between 1907 and 1911 revealed a Late Hittite palace of moderate dimensions at its summit, fortified with a practically rectangular enclosure measuring 400 × 300 ft. The gateway of the enclosure was on the lower side of the mound, while the palace occupied the opposite higher section of the walled precinct. The walls, which were nearly 12 ft. thick and rested on massive foundations, were strengthened by projecting external buttresses and, at the corners, by turrets.

The palace itself was approached through a portico containing an outstanding series of sculptures. Notable among these are the two life-size gate lions flanking the entrance to the palace and forming its cornerstones. The representations comprise sphinxes and other fabulous creatures in the Assyrian manner; likenesses of human beings and symbolic scenes, such as the "fertilizing of the sacred tree," reflect equally thoroughgoing Assyrian influence.

Since no inscriptional material was found at Sakjegozu, neither the ancient name nor the precise date of the palace settlement could be determined. To provide a stratigraphic substitute for more immediate chronological evidence, a deep sounding was made underneath the palace foundations down to virgin soil. The whole mound was found to be made up of the stratified debris of successive habitation layers, reaching back to Neolithic times; *i.e.*, the 5th and early 4th millennia B.C. Flint and obsidian implements and burnished monochrome pottery (mostly rather simple black, gray or brown bowls) characterize the early Neolithic phase. During the latter half of the period a new style of pottery using coloured paint makes its appearance.

See J. Garstang, *The Hittite Empire*, pp. 262–278 (1929); S. Lloyd, *Early Anatolia* (1956). (J. PL.)

SAKKARA: *see* SAQQARAH.

SALADIN (Arabian SALAH AL-DIN, "Honour of the Faith") (1138–1193), a successful leader of Muslim armies against the crusaders and founder of the Ayyubid dynasty (*see* AYYUBIDS) in Egypt, was born in Tikrit (Iraq). He belonged to a Kurdish family which had emigrated from Armenia in 1130. His father, Ayyub, and his uncle, Shirquh, rose to prominence in Syria, in the service of the famous anti-crusader champion Nureddin (*q.v.*). The climate of holy war (*jihad*) as well as the religious and cultural atmosphere animating the Muslim elite in Syria must have decisively influenced the young Saladin.

The struggle against the Latin-Christian states established by the First Crusade (whose European ruling caste is usually referred to as the "Franks") constituted the most important issue in the political and economic life of Syria and Egypt. Egypt's position had become vulnerable as a result of the decadence of the heterodox (Isma'ili) regime of its Fatimid caliphs. Internal struggles for power between various political and military Muslim factions had created favourable conditions for foreign intervention, and the Franks, covetous of the economic resources of Egypt, decided to turn to their own advantage the military impotence of the country. On the other hand, Nureddin was determined to prevent Egypt from falling into the hands of the Franks and to win it himself by military intervention. In the ensuing "battle of Egypt" (1164–68) Syrian troops commanded by Shirquh defeated the Franks and established their rule in the country. In the three expeditions of Shirquh's army, Saladin had played a major part. After the death of Shirquh (1169) Saladin was appointed as vizier of the Fatimid caliphate and as commander of the Syrian troops in Egypt. Fully conscious of Egypt's critical position, Saladin proceeded with various drastic measures intended to restore its

former strength. In 1171, at the strong insistence of Nureddin, Saladin abolished the Fatimid caliphate and officially proclaimed the return of Egypt to the traditional Sunni form of Islam. (*See* also FATIMIDS.)

Although nominally subject to the authority of Nureddin, Saladin was determined to conduct his own policy. Thus he was reluctant to commit his troops in the campaigns of Nureddin against the Franks. This clash of interests was brought to an end by the death of Nureddin in 1174. With his independence decisively secured, Saladin could devote his attention to the economic and military buildup of Egypt. Having organized strong land and naval forces, he carried out the internal pacification of the country and restored a zone of security around the southern and western approaches to Egypt, so essential for the normal operation of the Egyptian transit trade. A number of buildings, including colleges, a citadel, and an aqueduct, erected in Cairo during his rule, clearly indicated an improvement in the Egyptian economy.

Relying on the economic and military resources of Egypt, Saladin could proceed with an effective policy against the Franks. To strengthen the power of the Muslim front he planned to control Syria, the unity of which was shattered after the death of Nureddin. Between 1174 and 1186 Saladin, by diplomatic and military measures, succeeded in asserting his authority over many important Syrian cities, such as Damascus and Aleppo, and over Mosul and Irbil in Iraq. With strong armies under his command, he was then ready for war against the Franks. His task was facilitated by the popularity of the *jihad* against the Franks, for which he made frequent appeals. After the violation of peace by the Franks Saladin engaged their army on July 4, 1187, at Hittin (Hattin) near Tiberias in northern Palestine and after a bloody battle won a decisive victory. He then overran Palestine and, after offering generous terms to the Christian inhabitants of Jerusalem, entered the holy city on Oct. 2. Thus Jerusalem was restored to Islam after having been for 88 years in the hands of the Franks.

During his otherwise successful campaign in Palestine Saladin failed to conquer Tyre, where the remnants of the Frankish forces held him off. Ultimately they resumed the initiative by laying siege to Acre, and from June 1189 Acre became the concentration point for the land and naval forces of the crusaders arriving from Europe to reestablish their domination in the Holy Land. The European counteroffensive, known as the Third Crusade, directed all its power against Acre, whose heroic garrison, assisted from the outside by Saladin, sustained a siege of more than two years. It was only a tight naval blockade and the arrival of fresh English troops under the leadership of Richard I Coeur de Lion that forced Acre to capitulate (July 12, 1191). Yet, despite this setback, despite the superior forces of the Christians, despite heavy losses in men and armament resulting from the loss of Acre, and despite the destruction of his fleet and the straining to the utmost of the Egyptian economy, Saladin's stubborn determination in resisting the invasion of the crusaders turned the scales of victory at least partly in his favour. Most of the European contingents, worn out by the prolonged siege operations, returned home after the capitulation of Acre. Even the brilliant military exploits of Richard during his campaigns of 1191–92 did not change the overall results of that major showdown between the crusaders and the Muslims. The terms of the armistice concluded on Sept. 2, 1192, between Saladin and Richard, confirmed the ascendance of the Muslim forces. While the crusaders were given a coastal strip in Syria, Saladin remained in possession of the rest of the formerly contested territory, including Jerusalem. Thus his achievements definitely crippled the holdings of the crusaders in the Near East.

After the conclusion of the armistice Saladin returned to Damascus, where, on March 4, 1193, after a few days' illness, he died. He was buried in Damascus, his tomb becoming an object of great reverence. The regime of the Ayyubid family over Egypt and Syria, founded by Saladin, was continued by his brothers and their immediate descendants.

The character of Saladin and of his work is singularly vivid. In many ways he was a typical Muslim leader of the period of the Crusades. He was fiercely hostile toward the unbelievers who had established the crusader kingdoms, merciless toward the perjurers guilty of armistice violations, and yet tolerant of his own Christian subjects. His piety and strict observance of the rites of Islam did not affect his political judgment. To further the cause of Shirqūh, Saladin did not shrink from the assassination of Shawar, the Egyptian vizier, in 1169. To protect his own independence he obstructed the operations of Nureddin against the Franks. To strengthen the position of Egypt he did not hesitate to conclude a treaty with the Christian empire of the Byzantines. He was certainly a great personality, inspiring awe in Christendom and attracting the admiration of the Muslim world. His achievements profoundly affected the history of Egypt, as well as the destiny of the Near East. *See* also CRUSADES; EGYPT: *History;* and references under "Saladin" in the Index.

A more general study on Saladin, also contributed by H. A. R. Gibb, can be found in K. M. Setton (ed.), *A History of the Crusades,* vol. i, pp. 563–589 (1955). (A. S. Eu.)

SALADS: *see* FOOD PREPARATION.

SALAJAR (SALAYAR), the largest of a group of islands, including Bahuluang, Pulasi, and Tambulongan, lying south of Celebes (Sulawesi), Indonesia. It is more than 50 mi. (80 km.) long and 8 mi. (13 km.) at its widest point; area 259 sq.mi. (671 sq.km.). The population of the group (regency) was 87,278 in 1961, mainly a mixture of Makasars and Bugis. This is one of the most thickly populated parts of Celebes and is administered from Makasar. The islands are mountainous, but Salajar has fertile lowlands. Trepang, tortoise shell, copra, coconut oil, and salt are exported. (J. O. M. B.)

SALAMANCA, a city of west-central Spain and the capital of Salamanca Province. The adjoining provinces are Zamora and Valladolid to the north, Ávila to the east, and Cáceres to the south. Portugal lies to the west, and the northern part of the frontier is marked by the Duero River (Port., Douro). Pop. (1960) 90,498 (mun.).

The city rises to 2,631 ft. (802 m.) above sea level on the right (north) bank of the Tormes River, a tributary of the Duero. Its towers can be seen from some distance to the south. The Old Cathedral (Catedral Vieja, begun *c.* 1140) is a fine example of Romanesque, its domed clock tower rising above two circular tiers of windows and a vaulted roof. In 1512 it was described as a "very small, dark, low building"; fortunately it was not destroyed, and the New Cathedral (Catedral Nueva) was built round it on three sides, though not completed till the 18th century. The main building of the university faces the New Cathedral. It was built by 1494 and a stone medallion over the western doorway portrays Ferdinand and Isabella. The adjoining buildings include the former residence of Salamanca's most famous rector, Miguel de Unamuno (*q.v.*), with his library and personal relics.

To the south of the New Cathedral, a broad flight of steps leads up to the Neoclassical façade of the Colegio de Anaya (1760–68), designed by José Hermosilla and containing the faculties of science and of philosophy and letters. During the French occupation Gen. André Masséna made it his palace. The faculty of law adjoins the university, but the new faculty of medicine is in the valley to the west. Next to it stands the only remaining old residential college, the Colegio de Fonseca, generally known as the Colegio de los Irlandeses because it was ceded after the Peninsular War to the Irish as a seminary and so used until World War II. The property has reverted to the university but is not in use. It was built between 1527 and 1578 from funds provided by Archbishop Alonso de Fonseca. Its Renaissance quadrangle is the finest in Salamanca. Fonseca was also responsible for the Casa de las Muertes (so called from the death's heads formerly over the doorway), intended also for a university college, and for the Diputación Provincial (county hall). The former Jesuit seminary, built between 1617 and 1755 from plans by Juan Gómez de Mora, is now the Pontifical University, most of whose students are priests or seminarians. The Jesuits still officiate in its church of La Clerecía.

The Church of the Convent of the Augustinian Nuns was built

between 1636 and 1687, by order of Count Gaspar de Acevedo y Zúñiga, viceroy of Naples, for a natural daughter who became mother superior of the convent; the style is clearly Italian. It contains a famous painting of the Immaculate Conception by Jusepe de Ribera (*q.v.*, known as "Lo Spagnoletto"). The Dominican Convent, San Estéban, was mostly rebuilt under Juan de Álava from 1524 onward; older remaining portions include the cloister where Christopher Columbus was reputedly examined by the Council of Theologians in 1486. The Church of St. Thomas of Canterbury was originally built in 1175, two years after Thomas Becket's canonization, apparently under the direction of two English brothers and priests, named Richard and Randolph, who were lecturers at the university. Only the south wall of the original Romanesque building remains, the rest dating from the 15th century.

The Torre del Clavero (*c.* 1480) is almost all that remains of the town walls. The legendary Cave of Salamanca is the ruined crypt of the former Church of St. Cyprian; there, reputedly, the writer Enrique de Villena (*q.v.*) practised black magic. The walls of the 16th-century Casa de las Conchas are covered with carvings of scallop shells, the symbol of the military Order of Santiago of which its first owner, Talavera Maldonado, was chancellor. Gen. Viscount Wellington (later the duke of Wellington) in 1812 lodged in the 16th-century Palacio de San Boal, which suffered in later renovations.

The town centres round its fine arcaded Plaza Mayor, built (1729–33) by Andrés García de Quiñones, with the town hall on its west side by Alberto Churriguera. The square was originally intended to serve on occasion as a bull ring. The surrounding arcade is ornamented on two sides with medallions of the kings of Spain and Gen. Francisco Franco. During the French invasion, Masséna had his medallion put up, but it was afterward removed.

Three residential colleges for university students were built in the 1950s. North of the Plaza Mayor an avenue named the Gran Vía was still under construction in the 1960s; the arcades at the bottoms of some of the buildings recall those of the main square.

Fifteen of the 26 arches of the Roman bridge date from Roman times; a headless bull of Iberian date stands in the square at the end of it. Other bridges carry motor traffic and the railway. Rail services run direct to Madrid, Zamora, Plasencia, and Oporto, Port.; Salamanca is also on the direct line from the Spanish frontier at Irún to Lisbon. A military airfield at Matacán lies 12 mi. (19 km.) E. The town is an agricultural centre with few factories.

Hannibal ravaged the town in 220 B.C. A Roman town grew up because Salamanca (Salmantica) and its bridge were on the "Silver Road" from Astorga to Seville. It became a bishopric after the 3rd Council of Toledo in the 7th century, though during the Moorish occupation the bishop lived in Oviedo. From the 8th to the 11th centuries, the town was in the warring area between Christians and Moors. The Christian repopulation took place from 1087 to 1102. In 1178, Ferdinand II of León held his *Cortes* there and granted a special *fuero* (charter) to the city, by then the second in importance in his kingdom. The university came into existence under Alfonso IX of León in 1218, but the year of its real foundation was 1253 under Alfonso X (the Wise) of Castile and León. It was a leading centre of learning in Europe till the end of the 16th century. Francisco de Vitoria (*q.v.*) laid down the first principles of international law there in about 1526. St. Theresa or Teresa (*q.v.*) of Ávila founded a Carmelite convent in the town in 1570 and sought for other buildings there. Luis Ponce de León lectured in the university from 1561 until his death in 1591, except for the years 1572–76 when he was in an inquisition prison on a charge of unorthodoxy; a room in the university, still furnished with benches and other furniture of his day, is known as his *aula* (lecture hall). The French occupied Salamanca in 1808 until dislodged by Wellington in 1812; before leaving, they destroyed a quarter containing many university buildings. The university continued ecclesiastical until 1835, after which it was forcibly secularized. In the Civil War from 1936 to 1939 Gen. Franco took up residence in Salamanca in what is normally the episcopal palace.

SALAMANCA PROVINCE. Pop. (1960) 405,729. Area 4,763 sq.mi. (12,337 sq.km.), more than half of which is covered by typical *meseta* country. The Sierra de la Peña de Francia rises in the south, its highest point being Peña de Francia (5,653 ft. [1,723 m.]), crowned by a monastery and hostel. This part of the province is richly forested. The Sierra de Gata lies along the boundary with Cáceres Province. In spite of its dryness and relatively few trees, Salamanca is rich in vegetables, including sugar beet, and holm oaks, fruit trees, and cereals, especially wheat (Unamuno described it as "bread-bearing country"). Livestock and fighting bulls are plentiful, though Andalusian bulls are supposed to show more spirit. The town of Béjar has numerous cloth factories. Wellington won victories at the frontier village of Fuentes de Oñoro in 1811, and in 1812 at Salamanca and at the ancient walled town of Ciudad Rodrigo; for the last battle he was given the Spanish title of duke of Ciudad Rodrigo. Teresa of Ávila died in the Carmelite Convent of Alba de Tormes. (C. D. L.)

SALAMANDER, generally, any of the tailed amphibians, order Caudata, or Urodela, a group that includes eight very diverse families, most of which are exclusively North American. In a restricted sense, however, the name is applied to the European fire salamander, *Salamandra salamandra*, and its close relative *S. atra*. The family includes the cosmopolitan newts (*q.v.*) and several allied Eurasian genera. The fire salamander, with many differently coloured geographic races, ranges from Asia Minor through most of southern Europe to northwestern Africa. *S. atra* is confined to the Alps and the western Balkan Mountains.

The fire salamander, black with irregular yellow blotches, may reach a total length of 11 in. Contrary to the ancient belief that it can withstand the heat of a fire, it is ordinarily active only in the cool of the night, when it hunts insects, worms, slugs, and similar food. It winters beneath leaf litter and logs, more rarely under stones. Although it is normally solitary, aggregations are found in late autumn at favoured hibernating places. The salamander is tolerant of cold, however, and occasionally is seen on the surface on mild winter days.

The striking coloration of the fire salamander may serve more for concealment (due to the disruptive patterns) than for chromatic warning to predators. Most predators that attack a salamander are apt to leave it in distaste because of the salamander's poisonous skin glands. The glands' secretion is irritating to mucous membranes and if taken internally may be lethal, because of its adverse effect on the nervous system. The European water snake or ringed snake (*Natrix natrix*) is relatively immune to the secretion and preys frequently on *Salamandra*.

The fire salamander becomes sexually mature at four years of age. Courtship takes place in summer and fall. The breeding male noses under a receptive female and after moving about with her on his back, deposits a spermatophore that is picked up by the female's cloacal lips. Sperm overwinter in the female's reproductive tract and fertilize eggs internally the following spring. The embryos, generally about 30 in number, develop into gilled larvae by autumn but are usually not deposited until the next spring. The larvae are about one inch long when the female backs into a stream to release them. They double in size before transforming into adults and leaving the water permanently three to four months later. In *S. atra*, two young, half the length of the mother, are born fully metamorphosed. There are numerous eggs, as in *S. salamandra*, but normally only one survives in each oviduct. While growing, the embryo uses material from the other eggs, and late in development the gills effect a nutritive exchange with the oviductal walls resembling that of the mammalian placenta.

See also AMPHIBIA; and references under "Salamander" in the Index. (G. B. R.)

SALAMIS, a rocky island lying off the coasts of Megaris and Attica, Greece. Pop. (1961) 20,645; area 37 sq.mi. (95 sq.km.). Salamis encloses the wide Bay of Eleusis, which is entered from the Saronic Gulf by two narrow straits on the west and east. Neolithic and Bronze Age remains have been found, and the Late Mycenaean period is represented by many chamber tombs. The capital then lay at the narrow waist of the island and faced west to the Saronic Gulf, which was dominated by Aegina, and the Homeric poems associated Salamis and Aegina in the persons of the Salaminian princes Ajax and Teucer, sons of Telamon, who came from Aegina.

Some time after the Dorian occupation of Megaris (*c.* 1050 B.C.), Megara acquired Salamis and planted Megarian settlers (cleruchs) on the best land. Megara and Athens fought for the island at the turn of the 7th century, and Sparta, acting as arbitrator, awarded it to the Athenians, who allocated the best land to Athenian cleruchs, built a new capital on the east side at Kamatero facing Attica, and held the native Salaminians in a position of inferior status. The importance of Salamis grew with Athenian commercial expansion, since it lay close to the Piraeus and offered alternative anchorage. An Athenian magistrate was appointed annually to supervise the island.

In September 480 the Greek fleet, having withdrawn from Artemisium (*see* GRECO-PERSIAN WARS), stationed itself off Kamatero in narrow waters, while the much larger Persian fleet lay at Phaleron east of Piraeus. The Persians sent a squadron to close the narrow western strait, landed troops at night on Psyttaleia, an island in the eastern strait (probably Ayios Yeoryios), and advanced at dawn up the eastern strait. The Greeks made a withdrawal up the channel, formed their battle order, sailed out to engage the Persian fleet south of the bend in the channel (*i.e.*, off Kamatero), and proceeded to ram the Persian ships, which fell into disorder in the narrow space with reinforcements pressing up from behind. The Greek victory was decisive at sea, for the Persian navy never tried to reverse the verdict of Salamis.

The Athenians retained the island until the Macedonian period, when Cassander placed a garrison there in 318. The Athenians recovered it in 229 and planted cleruchs once more. Today there is a Greek naval base on Salamis at Arapis north of Kamatero, and a ferry service runs regularly to Attica.

Pritchett, "Toward a Restudy of the Battle of Salamis," *American Journal of Archaeology*, 63:251–262 (July 1959). (N. G. L. H.)

SALAMIS, the principal city of ancient Cyprus, situated on the east coast, north of the Pedias River and about 6 mi. (10 km.) N of Famagusta. It had a good harbour, well situated for commerce with Phoenicia, Egypt, and Cilicia, which was replaced in medieval times by Famagusta (*q.v.*) and is now wholly silted. Its trade was mainly in grain, wine, and oil from the midland plain and in salt from the neighbouring lagoons.

Traditionally, Salamis was founded after the Trojan War by Teucer, from the island of Salamis off Attica. There was certainly a Mycenaean colony at the neighbouring town of Enkomi. A king Kisu of Sillua is mentioned in a list of tributaries of Esarhaddon of Assyria in 672 B.C., and Sillua is usually identified with Salamis. Salamis seems to have been the principal Greek power in the island. The revolts against Persia *c.* 498 B.C., 386–380 B.C., and 351 B.C. were led by its kings Onesilos, Evagoras (*q.v.*), and Pnytagoras, respectively. In 306 B.C. Demetrius Poliorcetes won a great naval victory there over Ptolemy I of Egypt. Under Ptolemaic and Roman administration, Salamis flourished greatly, though the seat of the governors was at Paphos (*q.v.*). Roman remains include a gymnasium, a theatre, and an amphitheatre. Salamis was sacked in the Jewish revolt of A.D. 115–117; suffered repeatedly from earthquakes; and was wholly rebuilt by the emperor Constantius II (reigned 337–361) under the name Constantia. There was a large Jewish colony, and a Christian community was founded by Paul and Barnabas. Barnabas was himself a Cypriot, and his reputed tomb, discovered in 488, is still shown near the monastery of St. Barnabas. St. Epiphanius was bishop from 367 to 403. Salamis was the metropolitan see of Cyprus until the Latin conquest. The Greek city was destroyed by the Arabs under Mu'awiya *c.* 648; Christian survivors migrated to the neighbouring Ammochostos (Famagusta). *See* also CYPRUS: *History*.

SAL AMMONIAC (AMMONIUM CHLORIDE): *see* AMMONIA.

SALANDRA, ANTONIO (1853–1931), premier of Italy at the start of World War I, was born of a wealthy family at Troia, Puglia, on Aug. 13, 1853. He became a barrister, taught public administration at Rome University and was a conservative in politics. He became minister of agriculture in 1899 and was finance minister on two occasions, in 1906 and in 1909–10. When, in March 1914, Premier Giolitti resigned, Salandra was called upon to form the new cabinet.

Salandra was premier on the outbreak of World War I, and it was his cabinet that took the momentous decision of proclaiming Italy's neutrality, in spite of the existence of the Triple Alliance (Germany, Austria-Hungary, and Italy) because Austria-Hungary had declared war on Serbia without a previous agreement with Italy. After bargaining with both sides, in May 1915 Salandra assumed the still greater responsibility of bringing Italy into the war on the side of the Allies. This highhanded decision was taken during a parliamentary recess. Subsequently he had to resign office in June 1916, in consequence of the successful Austrian offensive in the Trentino. (*See* ITALY: *History*.)

During the disturbed period from 1919 to 1922 Salandra upheld the principles of authoritarian conservatism. He succeeded T. Tittoni as Italian delegate on the League of Nations council and in its assembly, and represented Italy in the Italo-Greek conflict of August–September 1923 (*see* CORFU). He supported the Fascist movement from the first but did not join the Fascist Party; and when he felt that Fascism was incompatible with the old Liberal tradition, especially after Mussolini's speech of Jan. 3, 1925, he modified his support. In 1928 on the proposal of Mussolini he was created a senator. He died on Dec. 9, 1931.

Salandra's war policy is covered in his books *La Neutralità italiana, 1914: ricordi e pensieri*, published in 1928, and *L'Intervento, 1915* (1930). (D. M. SH.)

SALAZAR, ANTÓNIO DE OLIVEIRA (1889–), the foremost Portuguese statesman of the 20th century, premier from 1932, was born to a peasant family at Vimieiro, near Santa Comba Dão, in Beira Alta Province, on April 28, 1889. After eight years at the seminary at Viseu, he decided against the priesthood and in 1910 entered the law school of Coimbra University, from which he graduated with high honours in 1914. He returned to Coimbra as a lecturer in economics in 1917 and was appointed to the chair of economics in 1918.

Salazar soon made a name for himself through his writings and speeches on political economy. After two previous attempts, he entered practical politics at the Army revolt of May 28, 1926, when the liberal and anticlerical parliamentary regime, which he despised, was replaced by a military dictatorship. He became finance minister on May 30 but held the post for only a few days. When the generals would not give him a free hand, he returned to Coimbra. On April 27, 1928, Salazar rejoined the cabinet under Pres. António Óscar de Fragoso Carmona (*q.v.*) in the same capacity but with control over income and expenditure.

Named premier by Carmona on July 5, 1932, Salazar became the strong man of Portugal and, with the widest power at his command, undertook to transform the Army revolt into a national revolution. The 1933 constitution of his *Estado Novo* ("New State"), which provided for an authoritarian state based on principles of social justice, incorporated ideas expounded by him since his student days. He was strongly influenced by the writings of Frédéric Le Play, Pope Leo XIII, and Charles Maurras (*qq.v.*), and of the Portuguese poet and historian António Sardinha, but his subsequent organization of the state also owed much to Fascist examples. During his period in office he also held the posts of minister of colonies (1930), minister of finance (1928–40), minister of war (1936–44), and minister of foreign affairs (1936–47).

Speaking at Braga on May 28, 1966, on the 40th anniversary of the Army revolt, Salazar claimed that the greatest achievement of his national revolution was the rehabilitation of the public finances. He had also modernized the railways, expanded the merchant marine, and carried out numerous public works projects. He increased the nation's international prestige by strengthening Portugal's ties with Brazil, Spain, Great Britain, and the United States, and a concordat in 1940 established a new *modus vivendi*

with the Vatican. He was less successful in solving Portugal's other problems. The rate of progress in education continued to be inadequate; the slow rise in the standard of living had little effect on the widespread poverty of the people; his government regulated political life to the exclusion of any effective opposition; and censorship of the press was never abolished. (*See* PORTUGAL: *History: The Republic, from 1910.*)

Salazar's private life has been one of frugal simplicity. A bachelor, he lives in a small apartment with his two adopted daughters, shunning publicity and rarely granting interviews or making public appearances and speeches. Industrious and dedicated, he has been a Catholic all his life.

Salazar's collected *Discursos e notas políticas* began to appear in 1935; a selection in English of some of his speeches, *Doctrine and Action,* appeared in 1939.

BIBLIOGRAPHY.—A. Ferro, *Salazar: Portugal and Her Leader,* Eng. trans. (1939); C. Garnier, *Salazar: an Intimate Portrait* (1954); L. Mégeban, *Le Vrai Salazar* (1958); J. Ploncard d'Assac (ed.), *Dictionnaire politique de Salazar* (1964). (M. CA.)

SALCEDO, a province in northern Dominican Republic, is the smallest province in area (191 sq.mi. [493 sq.km.]) and has the greatest density of population (1960 average, 415.5 per sq.mi. [160.4 per sq.km.]). Its many small farms produce a great quantity of cacao, coffee, corn, and some tobacco. The province is crossed by the eastern section of the low Cordillera Septentrional, which divides the drainage northward to the Atlantic from the streams that flow southward to the fertile Vega Real.

Salcedo was created in 1952 from Espaillat province. The population of Salcedo province was 79,170 in 1960.

The capital is Salcedo (pop. [1960] 6,175). (D. R. D.)

SALDANHA, JOÃO CARLOS DE SALDANHA OLIVEIRA E DAUN, DUQUE DE (1790–1876), Portuguese general and statesman whose turbulent career made him prominent for more than 50 years, was born at Azinhaga on Nov. 17, 1790, the son of the conde de Rio Maior and Maria, daughter of the marquês de Pombal. He joined the army in 1805 and fought throughout the Peninsular War (1808–14). With the rank of colonel he went to Brazil in 1815 and until 1821 fought in the Portuguese campaigns against the rebel José Artigas, attaining the rank of general. He returned to Portugal in 1823 and was appointed military governor of Oporto in 1825. After the accession in 1826 of Pedro IV (Pedro I of Brazil), Saldanha was responsible for the proclamation (July 1826) in Portugal of Pedro's constitutional charter (*see* PORTUGAL: *History*). Created a count in 1827, he emigrated to London with other liberals in October 1827, when Pedro's brother Dom Miguel became regent. After he was proclaimed King Miguel I (1828), Saldanha commanded two unsuccessful expeditions against him; to Portugal in 1828 and to the Azores in 1829.

He went to France, returning to Portugal in 1833 to fight for Pedro in the war against Miguel, which ended in the latter's abdication (May 1834). Saldanha was then created marquês. Following the accession of Maria II (September 1834), he headed the government from May to November 1835. He opposed the revolution of September 1836, and took part in the unsuccessful revolution of the marshals in 1837. Created duque in 1847 he was again head of the government in the disturbed political periods of 1847–49 and 1851–56. Ambassador to Rome (1862–65 and 1866–69) and envoy to Paris (1869), he returned to Portugal in 1865 to oppose the government; and in May 1870, in Lisbon, he made a military *pronunciamento* taking over the government. He resigned in August and became ambassador in London, where he died on Nov. 21, 1876.

See the Conde da Carnota, *Memoirs of . . . the Duke de Saldanha,* 2 vol. (1880). (DA. A. P.)

SALE, a municipal borough of Cheshire, Eng., lies 5 mi. (8 km.) SW of Manchester by road. Pop. (1961) 51,336. In 1930 the urban districts of Sale and Ashton-upon-Mersey were amalgamated. Sale was incorporated in 1935, and has since grown considerably. It is mainly residential in character but there are a few light industries. The Mersey River separates Sale from Manchester, Stretford and Urmston, and the Cheshire-Lancashire county boundary which follows the line of the Mersey also forms part of the borough boundary. The borough is situated astride the trunk road A. 56 (the Chester–Manchester road known as Watling Street), and the Bridgewater Canal (constructed 1770 by the Duke of Bridgewater) passes through the town. St. Martin's Church, founded in 1304, was rebuilt in 1714. (I. HU.)

SALÉ (Arabic SLA), an old walled town and former seaport on the Atlantic coast of Morocco, at the mouth of the Bou Regreg opposite Rabat (*q.v.*). The right bank of the river has silted up and Salé port is no longer in use. Pop. (1960) 75,799. Essentially a Muslim town, it has many mosques and tombs of saints and a *medersa* (Muslim school) built in 1333 during the Beni Marin dynasty. In the Middle Ages it was the most important merchant port and entrepôt of western Morocco. In the 17th century it became, with Rabat, a corsair republic. Several unsuccessful attempts were made by the French and British to overthrow it. Piracy organized by the "Sallee rovers" continued until 1829. (A. AM.)

SALEM, a town and district of Madras, India. The town, headquarters of the district, lies in the picturesque valley of the Tirumanimuttar between the Shevaroy Hills in the north and the Jaruguwalai Hills in the south, 206 mi. (332 km.) SW of Madras by rail. Pop. (1961) 249,145. It is well known for its handloom products, and manufactures cotton and silk dhoties (loincloths). A municipal college is affiliated with Madras University. The town is on the main road from Madurai to Bangalore.

SALEM DISTRICT (area 7,028 sq.mi. [18,203 sq.km.]; pop. [1961] 3,804,108) comprises three distinct plateaus: the first in the extreme north on the Mysore tableland (3,000 ft. [914 m.]); the second, or intermediate zone, comprising mostly the Eastern Ghats between 1,200 and 2,000 ft. (366 to 610 m.); the third in the south below the Eastern Ghats, descending from 1,200 to 300 ft. (91 m.). The northern and central parts have inferior soils, the prevailing types being red sand. About 1,500 sq.mi. (3,885 sq.km.) are under forests. The district is well known for mangoes, but the chief commercial crop is peanuts. In the Shevaroy Hills oranges, pears, and bananas are cultivated, and at Krishnagiri (north) grapes are grown. The Mettur Dam on the Cauvery, with a hydroelectric plant, lies 25 mi. (40 km.) NW of Salem. Since its completion in 1934 industrial development has been rapid, and there are chemical and textile industries at Mettur, Salem, and several other centres outside the district.

The district is sparsely dotted with thin bedded schistose gneisses which include crystalline marbles and iron ores. The iron ore deposits in the Kanjamalai and Thirthamalai hills alone are estimated to be more than 300,000,000 tons. Besides iron ore, the district has an abundance of bauxite reserves in the Shevaroy Hills. Emery powder is manufactured. With the Mettur power, the average annual output of aluminum was expected to be greatly expanded. (G. KN.)

SALEM, one of New England's most historic cities, is an old seaport in Essex county, Mass., U.S., about 15 mi. NE of Boston. Its diversified industry includes a large parlor-game plant; electronic devices and leather goods are also important products. Its principal modern interest, however, is linked with its distinguished past, particularly its remarkable early maritime achievements, its witchcraft trials and executions, and its associations with Nathaniel Hawthorne (*q.v.*).

Salem was founded in 1626 by Roger Conant, six years after the settlement of the "Old Colony" at Plymouth. In 1628 Gov. John Endecott brought a band of settlers there as an advance guard of the Massachusetts Bay colony, which was established in force at Boston in 1630. In 1629 the first Congregational church in America was organized at Salem by the Rev. Francis Higginson; Roger Williams was one of its early pastors. Several 17th-century homes are still standing, including the Pickering house (1660); the John Turner house (1668), immortalized by Hawthorne as "the house of the seven gables"; and the John Ward house (1684), preserved with 17th-century furnishings by the Essex institute. There is also the "witch house," where Judge Jonathan Corwin held some of the preliminary examinations during the witchcraft hysteria of 1692, in which 19 persons, chiefly women, were condemned and executed for supposedly practising the occult arts.

Salem's chief distinction to historical fame comes from its achievements at sea during the 50 years following the outbreak of the American Revolution. It had a very mediocre harbour and a meagre hinterland but during the "golden age" of the American merchant marine its ships and mariners voyaged with great success to distant seas, particularly beyond the Cape of Good Hope. The boom came from privateering during the American Revolution, when Salem vessels made about 445 captures. With trade routes open in 1783 after British colonial regulations were removed, some of the larger Salem privateers, especially those of Elias Haskett Derby, opened up new contacts with the Baltic, the Mediterranean, India and what Samuel E. Morison in his *Maritime History of Massachusetts* has called the Salem East Indies, with pepper from Sumatra as a specialty. Particularly high profits were made by the Derbys, the Crowninshields and others by neutral traffic during the Anglo-French wars from 1793 until the end of 1807, when the Embargo act ended virtually all commerce with foreign nations. Salem still contains much atmosphere from the heyday of that trade, particularly in the high, square brick houses, with beautiful carved woodwork, designed by Samuel McIntire (*q.v.*). Of these, the Pingree house (1804), beautifully furnished, is opened to the public by the adjacent Essex institute. The atmosphere of the great age of Salem shipping has been ably preserved by the national park service's 9-ac. Salem Maritime National historic site, established in 1938. It includes the great Derby wharf, commenced around 1760, and the adjacent, shorter Central wharf; the Derby house (1762); the McIntire-designed Hawes house (1801); and the Salem Custom house (1819), where Hawthorne, as surveyor of the port from 1846 to 1849, wrote part of *The Scarlet Letter*. Salem's commerce never regained its former volume, although after the embargo was lifted there developed a lively trade with Zanzibar and a factory was started to produce cloth for that market. Eventually, as ships became larger, the harbour could not accommodate them and Salem controlled and manned vessels operated out of Boston or New York.

Important custodians of the Salem tradition are the Essex institute, with its rich library and its quarterly *Historical Collections*, and the Peabody museum, housed in the old granite building of the East India Marine society and possessing maritime and ethnographic collections. In addition to Hawthorne, other distinguished Salem natives were Nathaniel Bowditch, pioneer in navigation; Timothy Pickering, early postmaster general and secretary of state; and William Hickling Prescott, the historian. Alexander Graham Bell did much of his significant telephone research while a resident of Salem.

For comparative population figures *see* table in MASSACHUSETTS: *Population.* (R. G. A.)

SALEM, a city of New Jersey, U.S., 38 mi. S.W. of Philadelphia, Pa., is the oldest permanent English settlement in the Delaware valley and many of its houses, as well as its Quaker meeting house, have been preserved from colonial times. It was established in 1675 on Salem creek, 2 mi. from the Delaware, by John Fenwick, an English Quaker. Fenwick took the name Salem, meaning "land of peace," from the Old Testament. In 1682 Salem received royal permission to become a port of entry. In the decade before the American Revolution, however, the collector of customs reported that smuggling, especially of rum, sugar and molasses, was prevalent. During the American Revolution, the British occupied Salem in 1778, following Anthony Wayne's foraging expedition into the area for supplies for Washington's army at Valley Forge. It was during these years that the massacre of American militia at the William Hancock house, 4 mi. from Salem, occurred. The house is now a state museum.

The railroad reached the edge of Salem in 1863 but did not come into the town itself until 1882, when a bridge was built over Salem creek. The decade of the 1860s also witnessed the establishment of a glass works and an "oil cloth" factory to make floor coverings. By the second half of the 20th century these two industries, along with canned foods, were the major sources of employment. Many inhabitants, however, commuted to work in nearby industries.

A point of historical interest is the Alexander Grant house (1721), home of the county historical society museum. The ancient oak tree under which Fenwick bartered with the Indians continues to attract visitors.

For comparative population figures *see* table in NEW JERSEY: *Population.* (H. F. Wt.)

SALEM, the capital of Oregon, U.S., and the seat of Marion County, is situated in the centre of the rich Willamette Valley, about 40 mi. from the Pacific coast and 50 mi. S of Portland. The government buildings, built along an open mall and dominated by a modern neoclassical capitol completed in 1939, are in the heart of the city. Volcanic peaks of the Cascade Mountains can be seen to the east and the forested Coast Range to the west.

In 1834 a group of Methodist missionaries came to Oregon under the leadership of Jason Lee, a native of the Canadian border, of New England parentage and education. The first site chosen for the mission, 10 mi. N of the present city of Salem, proved unhealthful, and in 1840 the mission was moved to a site known as Chemeketa, an Indian name which meant "place of peace." This they translated to the biblical name of Salem and there they erected a grist and sawmill and an Indian school.

In 1842 the missionaries decided to found a second school, for white children, called the Oregon Institute, which they hoped would become a university; the first instruction was given in 1844. To provide funds for the institute, the missionaries decided in 1846 to lay out a town and sell lots. The Willamette Valley was the focal point of the first migrations over the Oregon trail and as the population grew the mission townsite prospered. By a charter granted in 1853 the Oregon Institute became Willamette University, the oldest institution of higher learning in the western United States. It is still related to the Methodist Church and offers liberal arts training and graduate work in law, music and education.

Salem became territorial capital of Oregon in 1851 and was confirmed as state capital by popular vote in 1864. The city was chartered in 1857. As the state grew, city and government grew, the city spreading from the flood plain by the river to surrounding hills. The city has had a council-manager form of government since 1947.

An eight-month growing season, an annual rainfall of 40 in. and a variety of soils produces a diversity of more than 100 crops in the area and Salem's canneries and frozen-food plants make it an important processing centre. Strawberries, beans, blackberries, sweet corn, onions, cherries, and broccoli had the largest pack in the 1960s. As highways widened the market area, the city became a major retail centre. Wood, paper products, and metal fabrications are long standing and growing industries. The community used the Willamette River for transportation until 1933. It is served by north–south rail lines, an interstate highway and airlines.

The Salem Art Museum in the Asahel Bush house (1878) is a city cultural centre. In the city or nearby are state schools for the blind and deaf, state hospitals, Fairview Home for the Mentally Retarded, and penal institutions.

The population of Salem in 1960 was 49,142. In 1964 the U.S. Bureau of the Budget designated Marion and Polk counties as the Salem standard metropolitan statistical area. In 1960 this area had a combined population of 147,411. For comparative population figures *see* table in OREGON: *Population.*

SALE OF GOODS. The law of sale may be regarded as a branch of the law of contract, because sale is effected by contract. Thus the French jurist R. J. Pothier entitles his classical treatise on the subject *Traité du contrat de vente.* A completed contract of sale is a contract plus a transfer of property. If there be no agreement for a price, express or implied, the transaction is of the nature of a gift. If a transaction called a sale is, in fact, intended to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which attach to a mortgage. So, too, it is not always easy to distinguish a contract for the sale of an article from a contract for the supply of work and materials.

If a man orders a dental plate from a dentist, the contract is one of sale; but if he employs a dentist to fill one of his teeth with gold, the contract is for the supply of work and materials. The distinction is of practical importance because different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods—that is to say, tangible movable property.

GREAT BRITAIN

Codification in Britain: The Sale of Goods Act, 1893.—In 1847, when W. W. Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for several years the main principles had been well settled. In 1891 the subject seemed ripe for codification in Britain, and Lord Herschell introduced a bill which two years later passed into law as the Sale of Goods Act, 1893.

Sale is a consensual contract. The parties to the contract may supplement it with many stipulations or conditions they may see fit to agree to. The code of 1893 does not seek to fetter this discretion. The main object of the act is to provide clear rules for those cases in which the parties have either formed no intention or have failed to express it. When parties enter into a contract they contemplate its smooth performance, and they seldom provide for contingencies which may interrupt that performance, such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imparted by law.

When the code was in contemplation the case of Scotland gave rise to difficulty. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. The codifying bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the act applies to the whole of Great Britain. As regards England and Ireland, very little change in the law has been effected. As regards Scotland, the process of assimilation has been carried further but has not been completed. In a few cases the Scottish rule has been saved or reenacted, in a few other cases it has been modified, while on other points, where the laws were dissimilar, the English rules have been adopted.

Definition.—The act is divided into six parts, the first dealing with the formation of the contract. The first part, which may be regarded as the keystone of the act, is in the following terms:

> A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale may be absolute or conditional. When under a contract of sale the property in the goods is transferred from the seller to the buyer the contract is called a "sale," but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an "agreement to sell." An agreement to sell becomes a sale when the time elapses or the conditions are fulfilled subject to which the property in the goods is to be transferred.

This section clearly enunciates the consensual nature of the contract, and this is confirmed by sec. 55, which provides that "where any right, duty or liability would arise under a contract of sale by implication of law," it may be negatived or varied by express agreement, or by the course of dealing between the parties, or by usage, if the usage be such as to bind both parties to the contract.

The next question is who can sell and buy. The act is framed on the plan that if the law of contract were codified, this act would form a chapter in the code. The question of capacity is therefore referred to the general law, but a special provision is inserted (sec. 2) relating to the supply of necessaries to infants and other persons who are incompetent to contract. Though an infant cannot contract, he must live, and he can only get goods by paying for them. The law, therefore, provides that he is liable to pay a reasonable price for necessaries supplied to him, and it defines necessaries as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

Prevention of Fraud.—The fourth part of the act reproduced the famous 17th section of the Statute of Frauds, which was an act "for the prevention of frauds and perjuries." The object of that statute was to prevent people from setting up bogus contracts of sale by requiring material evidence of the contract, such as a written and signed agreement. It was long a much-disputed question whether this enactment brought about good or harm. It defeated many an honest claim, though it may have prevented many a dishonest one from being put forward. In 1954, in response to recommendations of the Law Revision Commission, this requirement of a writing to evidence the sale of goods was repealed (Law Reform [Enforcement of Contracts] Act, 1956, sec. 2).

As noted above, the obligation to pay a price is an essential element in a contract of sale, as distinguished from a gift. The price may be either fixed by the contract itself, or left to be determined in some manner thereby agreed upon; *e.g.*, by the award of a third party. But there are many cases in which the parties intend to effect a sale and yet say nothing about the price. Suppose that a man goes into a hotel and orders dinner without asking the price. How is it to be fixed? The law steps in and says that, in the absence of any agreement, a reasonable price must be paid (sec. 8). This prevents extortion on the part of the seller and unreasonableness or fraud on the part of the buyer.

Warranty.—The next question dealt with is the difficult one of conditions and warranties (sec. 10 and 11). The parties may insert what stipulations they like in a contract of sale, but the law has to interpret them. The term "warranty" has acquired a peculiar and technical meaning in the English law of sale. It denotes a stipulation which the law regards as collateral to the main purpose of the contract. A breach, therefore, does not entitle the buyer to reject the goods but only to claim damages. Suppose that a man buys a particular horse, which is warranted quiet to ride. If the horse turns out to be vicious, the buyer's only remedy is to claim damages, unless he has expressly reserved a right to return it. But if, instead of buying a particular horse, a man applies to a dealer to supply him with a quiet horse, and the dealer supplies him with a vicious one, the stipulation is a condition. The buyer can either return the horse, or keep it and claim damages. Of course the right of rejection must be exercised within a reasonable time.

In Scotland no distinction has been drawn between conditions and warranties, and the act preserves the Scottish rule by providing that, in Scotland, "failure by the seller to perform any material part of a contract of sale" entitles the buyer either to reject the goods within a reasonable time after delivery, or to retain them and claim compensation (sec. 11 [2]). In England it is a very common trick for the buyer to keep the goods, and then set up in reduction of the price that they are of inferior quality to what was ordered. To discourage this practice in Scotland the act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court pending a decision of the case (sec. 59).

In early English law there developed the principle that the buyer had only his carelessness to blame if the goods proved to be defective. This view, often called *caveat emptor* (let the purchaser beware), was well suited to primitive times. Men either bought their goods in the open marketplace, or from their neighbours, and buyer and seller contracted on a footing of equality. The complexity of modern commerce, the division of labour, and the increase of technical skill have altogether altered this state of affairs. The buyer is more and more driven to rely on the honesty, skill, and judgment of the seller or manufacturer. Modern law has recognized this and protects the buyer by implying various obligations in contracts of sale. The most important are imposed upon manufacturers or sellers who deal in particular classes of goods. They naturally have better means of judging their merchandise than the outside public, and the buyer is entitled within limits to rely on their skill or judgment. A tea merchant knows more about tea than his customers can, and so does a gunsmith about guns. In such cases, if the buyer makes known to the seller

the particular purpose for which the goods are required, there is an implied condition that the goods are reasonably fit for it, and if no particular purpose be indicated there is an implied condition that the goods supplied are of merchantable quality (sec. 14).

Effects of Contract.—The main object of sale is the transfer of ownership from seller to buyer, and it is often both difficult and important to determine the precise moment at which the change of ownership is effected. According to Roman law, which is still the foundation of most European systems, the property in a thing sold did not pass until delivery to the buyer. English law has adopted the principle that the property passes at such time as the parties intend it to pass. Express stipulations as to the time when the property is to pass are very rare. The intention of the parties has to be gathered from their conduct. A long train of judicial decisions has worked out a series of rules for determining the presumed intention of the parties, and these rules are embodied in sec. 16 to 20 of the act.

The first rule is negative. In the case of unascertained goods, *i.e.*, goods defined by description only, and not specifically identified, "no property in the goods is transferred to the buyer unless and until the goods are ascertained." If a man orders ten tons of scrap iron from a dealer, it is obvious that the dealer can fulfill his contract by delivering any ten tons of scrap that he may select, and that until the ten tons have been set apart, no question of change of ownership can arise. But when a specific article is bought, or when goods ordered by description are appropriated to the contract, the passing of the property is a question of intention. Delivery to the buyer is strong evidence of intention to change the ownership, but it is not conclusive. Goods may be delivered to the buyer on approval, or for sale or return. Delivery to a carrier for the buyer operates in the main as a delivery to the buyer, but the seller may deliver to the carrier and yet reserve to himself a right of disposal. On the other hand, when there is a sale of a specific article, which is in a fit state for delivery, the property in the article *prima facie* passes at once, even though delivery be delayed. When the contract is for the sale of unascertained goods, which are ordered by description, the property in the goods passes to the buyer, when, with the express or implied consent of the parties, goods of the required description are "unconditionally appropriated to the contract." It is perhaps to be regretted that the codifying act did not adopt the test of delivery, but it was thought better to adhere to the familiar phraseology of the cases.

Sec. 20 deals with the transfer of risk from seller to buyer and lays down the *prima facie* rule that "the goods remain at the seller's risk until the property therein is transferred to the buyer, but when the property therein is transferred to the buyer, the goods are at the buyer's risk whether delivery has been made or not." *Res perit domino* is therefore the maxim of English, as well as of Roman law.

Conflicting Claims to Goods.—In the vast majority of cases people sell only what they have a right to sell, but the law has to make provision for cases where a man sells goods which he is not entitled to sell. An agent may misconceive or exceed his authority. Stolen goods may be passed from buyer to buyer. Then comes the question, which of two innocent parties is to suffer? Is the original owner to be permanently deprived of his property, or is the loss to fall on the innocent purchaser? Roman law threw the loss on the buyer. French law, in deference to modern commerce, protects the innocent purchaser and throws the loss on the original owner. English law is a compromise between these opposing theories. It adopts the Roman rule as its guiding principle, but qualifies it with certain exceptions, which cover perhaps the majority of the actual cases which occur (sec. 21 to 26).

In the first place, the provisions of the Factor's Act, 1889 (extended to Scotland by 53 and 54 Vict. c. 40), are preserved. That act validates sales and other dispositions of goods by mercantile agents acting within the apparent scope of their authority, and also protects innocent purchasers who obtain goods from sellers left in possession, or from intending buyers who have got possession of the goods while negotiations are pending. In most cases a contract induced by fraud is voidable only, and not void, and the act, accordingly, protects an innocent purchaser from a seller who obtained the goods by fraud.

The ancient privilege of market overt (*i.e.*, "open market"), under which rights may be obtained even in stolen goods, is preserved virtually intact (sec. 22). The operation of this rule is fitful and capricious. For example, every shop in the City of London is within the custom, but the custom does not extend to the Greater London outside. If then a man buys a stolen watch in Fleet Street, he may get a good title to it, but he cannot do so if he buys it a few doors off in the Strand. There is, however, a qualification of the rights acquired by purchase even in market overt. When goods have been stolen and the thief is prosecuted to conviction, the property in the goods thereupon revests in the original owner, and he is entitled to get them back either by a summary order of the convicting court or by action. This rule dates back to the statute 21 Hen. VIII. c. II. It was probably intended rather to encourage prosecutions in the interests of public justice than to protect people whose goods were stolen.

Seller's and Buyer's Rights and Duties.—Having dealt with the effects of sale, first, as between seller and buyer, and, second, as between the buyer and third parties, the act proceeds to determine what, in the absence of convention, are the reciprocal rights and duties of the parties in the performance of their contract (sec. 27 to 37). "It is the duty of the seller to deliver the goods and of the buyer to accept and pay for them in accordance with the terms of the contract of sale" (sec. 27). In ordinary cases the seller's duty to deliver the goods is satisfied if he puts them at the disposal of the buyer at the place of sale. The normal contract of sale is represented by a cash sale in a shop. The buyer pays the price and takes away the goods. "Unless otherwise agreed, delivery of the goods and payment of the price are concurrent conditions" (sec. 27). But agreement, express or implied, may create infinite variations on the normal contract. It is to be noted that when goods are sent to the buyer which he is entitled to reject, and does reject, he is not bound to send them back to the seller. It is sufficient if he intimates to the seller his refusal to accept them (sec. 36).

Remedies of Buyer and Seller.—The ultimate sanction of a contract is the legal remedy for its breach. Seller and buyer each have their appropriate remedies. If the property in the goods has passed to the buyer, or if, under the contract, "the price is payable on a day certain irrespective of delivery," the seller's remedy for breach of the contract is an action for the price (sec. 49). In other cases his remedy is an action for damages for non-acceptance. In the case of ordinary goods of commerce the measure of damages is the difference between the contract price and the market or current price at the time when the goods ought to have been accepted. The convenient market-price rule is subordinate to the general principle that "the measure of damages is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer's breach of contract" (sec. 56). Similar considerations apply to the buyer's right of action for nondelivery of the goods (sec. 51). In exceptional circumstances the remedy of specific performance is available to the buyer (sec. 52). Thus the court might order the specific delivery of an autograph letter of an otherwise unrecorded signatory of the Declaration of Independence. The seller's rights are further protected by the rules as to lien and stoppage *in transitu* (sec. 38 to 48).

The Sale of Goods Act has been adopted in substance by many countries of the Commonwealth of Nations and was followed in the main by the Uniform Sales Act in the United States (see below). (M. D. C.; J. O. Ho.)

UNITED STATES

The English law, as stated above, gives in general outline a picture of the United States law as it developed in early case law and as it was codified in the Uniform Sales Act. Samuel Williston, in drafting the Uniform Sales Act for the Commissioners on Uniform State Laws, closely followed the British Sale of Goods Act both in structure and language, though making significant changes at a few points. The Uniform Sales Act, com-

pted in 1906, was adopted in over 30 states. But in 1953 the states began to adopt the thorough revision of sales law contained in the Uniform Commercial Code.

Uniform Sales Act.—*Warranty.*—The chief divergence of American sales law, as reflected in the Uniform Sales Act, from the English law described above has to do with warranties; *i.e.*, the nature of the seller's obligation with reference to the kind and quality of goods sold. The facts which will place some obligation on the seller with reference to quality are substantially the same in both countries. But in the United States, if the seller has undertaken any obligation in this respect, the buyer, in the majority of states, will be entitled not only to damages (the English "warranty") but also (at his election) to return the goods and recover the price (the English "condition").

The long controversy over the buyer's power to return defective goods indicates the extent to which the law of warranty has been a creature of mercantile law, designated to settle disputes about goods between merchants. The law of warranty, however, has been put to another striking social use: that of allocating the risks incident, in a highly industrialized society, to the use of goods manufactured by persons with whom the user has no direct contact, who may be located in a distant place, whose methods the user has neither skill nor opportunity to know, but whose efficiency he is forced by the nature of the market to rely upon. Injury in those cases results, *e.g.*, from a tack or a piece of glass concealed in a cake or a can of beans, from the explosion of an automatic water heater, or from the breaking of an automobile wheel. In such cases return of the goods is not in question, but only the allocation of the damage suffered. The device of an action for negligence (*q.v.*) has been extended for this purpose; but recovery on this ground may fail if the injured party cannot prove carelessness in manufacture, or if the jury is persuaded by the defendant's evidence of sound manufacturing methods.

On the other hand, wherever remedy in warranty is available, it requires no proof of negligence at all: the seller is held to guarantee against dangerous defects in the article. Traditionally, recovery for warranty depends on a sales transaction between the parties involved. This rule has freed manufacturers from direct liability to the injured party, who nearly always buys from a retail store or other intermediary and not directly from the manufacturer. But a very different judicial approach has developed based in part upon the need to protect consumers, especially from dangerous food—and later other commodities; this trend has been strengthened by the view that through mass advertising manufacturers establish direct contact with consumers and should be responsible directly to consumers for defective goods. The courts have moved far toward satisfying a definite social need, which the traditional legal devices based on proof of negligence can satisfy only with delay and distortion.

Documents of Title.—One feature of American law in which wide changes have been worked requires mention. The old rule that no man might convey goods which he did not own imposes on buyers either a noticeable risk (of having any goods which have been improperly sold to them recovered by their true owners) or a degree of investigation incompatible with rapid turnover. Especially dangerous and impracticable is this in the case of bankers advancing money on the security of goods in warehouse or in transit, a banker's margin of profit is too low to make losses readily compensable, and inquiry into title is in general outside his competence. A practice therefore grew up, in the case of goods in warehouse, of accepting the warehouseman's receipt for the goods, if fair on its face, as full evidence of title to the goods, and of dealing with the receipt as with the goods themselves. The same practice developed, even earlier, with reference to bills of lading; *i.e.*, carriers' receipts for goods entrusted to their care.

This mercantile custom has received full warrant at law in the United States, not only in the states which adopted the Uniform Sales Act (beginning in 1906) but also, as to bills of lading, in the more than 30 states which adopted the Uniform Bills of Lading Act (from 1909). In addition, the federal version of the latter act covers bills of lading arising from interstate shipments, and all states adopted the Uniform Warehouse Receipts Act (beginning in 1906). The Uniform Sales Act, the Uniform Bills of Lading Act, and the Uniform Warehouse Receipts Act are superseded in states adopting the Uniform Commercial Code (*see* below). All these laws distinguish sharply between straight or *nonnegotiable* documents of title and *order* or negotiable documents. The former can transfer only such rights as the transferor possesses, and, in case of fraud, the true owner can regain the property from a purchaser of the documents; on the other hand, negotiable documents carry a promise to deliver to the order of a named person, and in general give a bona fide purchaser (or pledgee) all the rights apparent on their face, even though the transferor may have lacked such rights. The English law is to the same effect, and even expressly extends the same rules to policies of marine insurance drawn in proper form. (K. N. L.; J. O. Ho.)

Uniform Commercial Code.—In 1940 the Commissioners on Uniform State Laws, later joined by the American Law Institute, undertook the revision of several fields of law relating to commercial activity, including the sale of goods. More than a decade later this project culminated in the Uniform Commercial Code, the chief reporter of which was Karl N. Llewellyn. The code was first adopted in Pennsylvania in 1953 and within a few years by a substantial majority of the states.

One of the divisions of the code, art. 2, revises the law for the sale of goods, supplanting the rules embodied in the Uniform Sales Act and, in addition, establishing statutory rules for sales of goods which had been left to traditional case law; these include rules governing offer and acceptance in the making of contracts, assignment of contracts, and the effect of "unconscionable" contract provisions.

The sales article of the code does not closely follow either the language or the approach of the Uniform Sales Act. The fewest innovations are in the field of seller's responsibility for the quality of the goods (seller's "warranties," discussed above), but even in this several difficulties in the older law are removed, such as the rule limiting seller's responsibility for goods purchased under a patent or trade name.

The most striking feature of the code is its statement of separate rules for a number of sales problems instead of referring them to the concept of "property" or "title." Under the Uniform Sales Act a wide variety of legal problems are referable to the question of who has "property" in the goods. Deciding whether property in the goods has passed may determine whether the seller may recover the full price or only damages from a buyer who has wrongfully refused to accept delivery of the goods. The same test may determine whether the buyer may replevy goods from a seller who wrongfully refuses to deliver them. The buyer may bear the risk of fire or other loss before he receives the goods if "property" has passed. In measuring the buyer's damages the point at which property passed has been employed instead of the market in which the buyer purchases substitute goods.

The code provides separate rules for these different problems. The goal of its drafters was to state the rules in terms of objective facts which could be seen and ascertained more readily than could a legal concept such as "property" or "title." Thus, the code makes risk of loss turn on events such as delivery to the carrier or, if shipment is not involved, on receipt of the goods by buyer. The seller's right to recover the full price rather than damages turns on events such as whether the buyer has accepted the goods. A buyer's right to replevy goods turns on whether they have been "identified" and on whether the buyer has been able to procure substitute goods. The code does set forth rules for the passage of "property" in goods, but since they apply only to problems for which no specific rule is provided, their impact is slight. In this manner the code has developed rules which, while more detailed, are more clearly suited to the separate practical problems at hand than the general concepts of property or title.

INTERNATIONAL UNIFICATION

Various measures have been attempted to cope with the legal problems arising from sales transactions that cross international boundaries and thus often involve legal systems with different traditions and understandings. The differences may be so great

that the obligations and understandings in the country at one end of the transaction may be unintelligible to traders and their attorneys in the other.

The most fruitful approach to unification has been a uniform contract for voluntary adoption by the traders involved. Trade organizations in the United States have formulated the Revised American Foreign Trade Definitions giving the implications of important terms, such as "c.i.f.," "f.a.s.," and "f.o.b." (*see* F.O.B.); the International Chamber of Commerce has promulgated a similar set of definitions entitled *Incoterms*. The Economic Commission for Europe has formulated detailed standard contracts designed to prevent misunderstanding in international trade in several commodities such as lumber, citrus fruit, machinery, and grain. The International Institute for the Unification of Private Law, an organization of 40 nations (including the United States), with headquarters in Rome, has sponsored the drafting of a Uniform Law for the International Sale of Goods. In 1964 a diplomatic conference at The Hague attended by 28 nations, including the United States, redrafted this Uniform Law and offered a convention implementing it to the states of the world for ratification. The conference also completed work on a Uniform Law on the Formation of Contracts for the International Sale of Goods. Each law would go into effect when ratified by five states.

SALERNO, a Tyrrhenian seaport of Campania, Italy, capital of Salerno Province and an archiepiscopal see, lies west of the mouth of the Irno River in the Gulf of Salerno, 34 mi. (54 km.) SE of Naples by rail. Pop. (1961) 123,391 (commune). The modern town, bordered seaward by a fine promenade with public gardens, skirts a hill on whose summit (the site of a Roman fortress) are the ruins of the castle of Arechi, duke of Benevento and Lombard prince. The Porta Rateprandi, or Arco di Arechi, and the remains of a palace also date from the Lombard period. The town's principal monument is the Cathedral of S. Matteo, founded in 845 and rebuilt in 1076–85 by Robert Guiscard. In the crypt beneath the apse is the sepulchre of St. Matthew, whose body, according to legend, was brought to Salerno in the 10th century. In the Chapel of the Crusades, founded by Giovanni da Procida (1210–98), hero of the Sicilian Vespers and a native of Salerno, is the tomb of Pope Gregory VII, who died at Salerno in 1085. The cathedral also contains the tomb of Margaret of Durazzo (d. 1412), wife of Charles III, king of Naples. The town has grown considerably since World War II, when it was damaged by bombardment.

Salerno is on the Naples-Paola Railway and is traversed by the main road to Calabria. The Naples-Salerno extension of the Autostrada del Sole from Milan was completed in 1962. The main industrial products and exports are foodstuffs, cement and construction materials, textiles, machinery (steam boilers), ceramics, and wrought ironwork.

The Roman colony of Salernum was founded in 197 B.C. on the site of an earlier town, possibly Etruscan, called Irnthi. From A.D. 646 it was part of the duchy of Benevento and from 839 capital of an independent Lombard principality. In 1076 it was conquered by Robert Guiscard, whose splendid capital it became. Sacked by the Swabians in 1194, it revived under Giovanni da Procida, who enlarged the port and started a great annual fair. In 1419 it passed to the Colonna and later to the Orsini and the Sanseverino. In 1799 it adhered to the Parthenopaean Republic, following the fortunes of Naples.

Much of Salerno's historic interest derives from the medical school—the earliest in Europe—which flourished there in the 11th century and to which flocked students from Europe, Asia, and Africa to qualify as doctors of medicine. (*See* also MEDICINE AND SURGERY, HISTORY OF: *Arabian Teaching and the School of Salerno.*)

Battle of Salerno.—On Sept. 9, 1943, the Allies landed on the Salerno coast and became engaged in a hard-fought battle with the Germans. Air and naval support enabled them to hold off strong counterattacks until the arrival from Calabria on Sept. 18 of the advance guard of the British 8th Army, after which the Germans were forced to withdraw.

SALERNO PROVINCE forms the southern part of Campania, bordering the Tyrrhenian Sea and the provinces of Naples (northwest), Avellino (north), and Potenza (east). Area 1,901 sq.mi. (4,923 sq.km.). Pop. (1961) 887,857. Apart from the fertile alluvial plain of the Sele and lesser coastal areas, the province is mountainous or hilly.. The highest points are Mt. Cervati (6,230 ft. [1,899 m.]) in the Cilento group and Mt. Polveracchio (5,873 ft. [1,790 m.]) in the Picentini chain. The main crops are grain, grapes, citrus fruits, olives, chestnuts, and tobacco. There are canning factories at Nocera Inferiore, Pontecagnano, and Battipaglia, and the last-named has the largest tobacco factory in southern Italy. The coastal road along the Sorrento Peninsula through Amalfi to Salerno is a noted tourist attraction. (M. T. A. N.)

SALESBURY (SALISBURY), **WILLIAM** (*c.* 1520–*c.* 1584), the greatest Welsh scholar of his time, first translator of the New Testament into Welsh, was a native of Denbighshire. He was educated at Oxford, where he accepted the Protestant faith, but he passed most of his life at Llanrwst, working at his literary undertakings. Salesbury was acquainted with nine languages, including Latin, Greek, and Hebrew, and was learned in philology and botany. About 1546 he edited a collection of Welsh proverbs (*Oll synwyr pen kembero*), probably the first book printed in Welsh, and in 1547 his *Dictionary in Englyshe and Welshe* was published (facsimile edition, 1877). In 1563 the English Parliament ordered the Welsh bishops to arrange for the translation of the Scriptures, and the Book of Common Prayer into Welsh. The New Testament was assigned to Salesbury, who had previously translated parts of it. He received assistance from Richard Davies, bishop of St. David's, and also from Thomas Huet, or Hewett (d. 1591), but he himself did the greater part of the work, basing it on the Greek version. In October 1567 the New Testament was published in Welsh for the first time. This translation, never popular, served as the basis for the new one made by Bishop William Morgan (*c.* 1547–1604).

Salesbury and Davies continued to work together, translating various writings into Welsh, until about 1576 when the literary partnership was broken. After this, Salesbury produced nothing of importance.

SALESIANS (SOCIETY OF ST. FRANCIS DE SALES OR SALESIANS OF DON BOSCO; SOCIETAS S. FRANCISCI SALESII; S.D.B.), a Roman Catholic religious congregation of men founded at Turin, northern Italy, in 1859, by St. John Bosco. It was the spirit of meekness and charity of St. Francis de Sales that the founder sought to incorporate into his religious society, which he created for the purpose of educating poor boys (especially for the priesthood) and combating the irreligion widespread in Italy at that time. His congregation was approved in 1874. The Salesians continue to be dedicated to the Christian education of youth, using the practical educational method of St. John Bosco, which they call the "preventive system," a method based on reason, religion, and kindness. The Salesian Sisters (Daughters of Our Lady of Help of Christians) was founded in 1872 by Don Bosco and St. Mary Mazzarello (1837–81), the first mother general, to do for girls what the Salesians do for boys. The Salesian Cooperators, a third order consisting of lay people, was also started by Don Bosco, in 1875.

The Salesians' growth has been extraordinary; among Catholic orders it is exceeded in membership only by the Jesuits and the Franciscans. Its works of charity for the social, economic, and professional welfare of youth include recreational centres in large cities, youth clubs, trade and agricultural schools, academic schools, parishes, summer camps, seminaries, foreign missions, etc. Though not a missionary organization, it also ranks third among all Catholic

foreign missionary societies. The motherhouse is at Rome.

(F. J. Pe.)

SALFORD, a city and a municipal, county and parliamentary borough, Lancashire, Eng., 2 mi. W of Manchester. Pop. (1961) 155,090. Area 8.1 sq.mi. The parliamentary borough returns two members, for Salford East and Salford West. Salford is a quarter sessions borough.

The borough, composed of three townships identical with the ancient manors of Salford, Pendleton and Broughton, is for the most part separated from Manchester by the River Irwell. The main railway station is Exchange station which is connected with Victoria station, Manchester, by one of the longest railway platforms in the world. Salford town hall was built in 1825 and Pendleton town hall in 1866. St. John's Roman Catholic cathedral was opened in 1848. Peel Park, formerly Lark Hill but renamed after Sir Robert Peel, contains the art gallery and museum and the Royal Technical College (1896). In Buile Hill Park is the natural history museum.

The only old building remaining in Salford is Ordsall Hall, the ancient seat of the Radcliffe family, which dates from 1350. Kersal Cell, the site of a 12th-century Cluniac monastery, was the birthplace of John Byrom (1692–1763). James Joule (1818–89), the physicist, was born in Salford.

The Flemish weavers settled first in Salford in about 1360, and from that date it has been one of the foremost cotton towns. To the opening of the Manchester Ship Canal (*q.v.*) in 1894 is due its great commercial importance, for it contains the largest docks on this canal. Raw cotton is imported and among many exports are manufactured cotton and woolen goods, machinery and locomotives. Salford is an important centre for importing timber and also a great distributing centre. It has more than 1,000 factories which include cotton spinning, bleaching and dyeing, brewing, the making of rubber goods and waterproofed fabrics, paper mills, and engineering.

Neolithic implements, British urns and Roman coins have been found within the borough. Domesday Book mentions the Great Hundred of Salford (of which Manchester formed a part) as held by Edward the Confessor and covering some 400 sq.mi. At the Conquest it was part of the domain granted to Roger le Poitevin. In 1228 Henry III granted the town an annual fair and market and a weekly market; in 1825 George IV granted two annual fairs and a weekly market. When the corporation bought the market rights they built a new market, on the site of the old cattle market, which was opened in 1939.

In 1230 Ranulf de Blundeville, earl of Chester, granted a charter constituting Salford a free borough and it was administered according to this charter until 1791. In 1267 Salford was granted by Henry III, with all the crown demesne, to his son Edmund, earl of Lancaster.

When the house of Lancaster succeeded to the throne its Lancashire possessions were kept separate and Salford remained part of the duchy of Lancaster thereafter. The borough was incorporated as a municipal borough in 1844; Broughton and Pendleton were amalgamated with it in 1853; in 1888 it became a county borough. It was raised to the status of a city in 1926.

SALICACEAE, the willow family of woody plants, consists of two genera, *Populus* (poplars) and *Salix* (willows). The members are typically catkin bearing, with simple deciduous leaves. Male and female flowers are borne on different individuals, are subtended by bracts, and are each provided with a nectar gland; the seeds are circled by tufts of hairs. Salicaceae are indigenous in most parts of the world, especially in the temperate and subarctic zone of the Northern Hemisphere. Hybridization occurs freely. The main economic importance lies in their fast growth and easy propagation by cuttings. Many species of *Salix* have flexible twigs used for making baskets. *See* Willow; Poplar; Osier.

(K. H. R.)

SALICETO (Guglielmo Saliceti) (*c.* 1210–1277), Italian physician who did much to initiate the early renaissance of surgery, was born in the village of Saliceto, in Piacenza, a province of Lombardy. He had a university education and extensive military and hospital experience. He taught surgery at the University of Bologna (*c.* 1268) and later became city physician of Verona. Saliceto wrote books on both medicine and surgery, and insisted (against the practice of his time) on the close relationship of these arts. His most important work, the *Cyrurgia* (first printed in 1476), is the earliest complete treatise on surgery. The book contains many acute clinical observations but is most remarkable for its section on anatomy for the surgeon, and for the author's insistence that surgical practice be based on careful case histories, of which he provides examples. His most influential pupil was Lanfranchi of Milan, who taught in Paris; from there the doctrines of Saliceto spread to England and the Low Countries.

(L. M. Z.)

SALIC LAW, the code of laws of the Salian Franks (*see* Franks) who conquered Gaul in the 5th century A.D., is the most important, although not the oldest, of all the early Teutonic laws (*leges Germanorum*). The code was issued late (*c.* 507–511) in the reign of Clovis, the founder of Merovingian power in Western Europe. It was twice reissued and enlarged under the descendants of Clovis, and under the Carolingians it was repeatedly altered and systematized and was translated into Old High German.

In its original form the code is structurally of the pre-Christian era, the only one of the kind that exists. The laws of the Visigoths and the Burgundians, which are earlier in date than the Salic Law (*see* Germanic Laws, Early), as well as the laws of the Lombards and the Anglo-Saxons, which are later, all show appreciable Christian influence; the Scandinavian codes, although archaic in other respects, all begin with a section on ecclesiastical law. Despite the fact that it was first written down in Latin, the Salic Law was very little influenced by Roman law. The Frankish legal terms used in it are sometimes latinized, but remained in Frankish in the so-called Malberg glosses surviving in some manuscripts. These are not glosses in the normal sense, but Frankish words and sentences which remained in the text and which were probably those in common use in the Frankish *mallus* or *mallobergus,* the court of law. The Salic Law is preeminently a penal code, giving a long list of fines (*compositio*) for various offenses and crimes. But it also contains some civil-law enactments. Among these is the chapter *de alode* which declares that daughters cannot inherit land. Under the later Valois, lawyers incorrectly attributed to this chapter the existing assumption that women should not succeed to the crown, though it had not been invoked to exclude the daughters of Louis X, Philip V, and Charles IV (*see* Salic Law of Succession).

In addition to the Salic Law, a few other Frankish laws are known. The *Lex Ribuaria* was the law of the Ripuarian Franks, whose centre was Cologne. Surviving manuscripts all date from Carolingian times, but historians are agreed that there must have been two previous codifications. The first was begun under the Merovingian king Clotaire II after his acquisition of Austrasia (613), so that the duchy of the Ripuarians, part of the Austrasian kingdom, might be assimilated in law to the remainder of his possessions; it was finally promulgated by Clotaire's son Dagobert I, probably *c.* 623–625. The second codification was made when the powerful Grimoald was mayor of the palace (*see* Mayor of the Palace) in Austrasia (643–662); it borrowed extensively from the Salic Law and was intended to expand the *Lex Ribuaria* into a general code of laws for all Austrasian Franks.

Finally, there is a judicial text in 48 titles, headed *Notitia vel commemoratio de illa ewa* [law] *quae se ad Amorem habet* and also called *Lex Francorum Chamavorum.* The duchy within whose frontiers it was followed comprised probably the whole Frankish part of the diocese of Utrecht, between the Rhine and IJssel rivers. As the law was written down by a royal *missus* (an official regularly used by the Carolingians to supervise provincial administration), this must have been done in the Carolingian period, probably in 802–803.

Beyerle and R. Buchner (eds.), *The Lex Ribuaria* (1954), and R. Sohm (ed.), *Lex Francorum Chamavorum* (1883), are also in the *Monumenta Germaniae historica*. (K. A. ECK.)

SALIC LAW OF SUCCESSION, the rule by which in certain sovereign dynasties women and also males whose descent from a former sovereign is traced only through a woman are excluded from succession to the throne. Gradually formulated in France, the rule takes its name, somewhat misleadingly, from the *lex Salica* or law of the Salian Franks (*see* SALIC LAW).

From Hugh Capet, who died in 996, to Philip IV, who died in 1314, Capetian kings of the direct line were not faced with any problem about the succession to the throne of France because each one had a son who could take his place (*see* FRANCE: *History*). Even so, it was the custom down to Louis VII's reign for the king during his own lifetime to associate his son with him in the exercise of power—partly out of loyalty to Carolingian tradition, partly from a vague sentiment of the elective character of the monarchy. From the reign of Philip II Augustus onward, however, it came to be regularly accepted that the eldest son should succeed to the crown of his own right on his father's death, even though no document was ever produced to sanction this tradition. At the same time there was likewise no document prescribing how the succession should be settled if a king were to die without leaving any male descendants. When Louis X died, on June 5, 1316, his queen, Clémence of Hungary, was pregnant; but his posthumous son, John I, died on Nov. 19, only five days old.

It was between 1316 and 1328 that the principle whereby women were excluded from succession to the French throne was established; and between 1328, when Philip of Valois became king as Philip VI, and 1437, when Charles VII made his royal entry into Paris, the corollary principle came to be accepted, namely that descent from the daughters of French kings could not be admitted as constituting a claim to the royal succession. It is important meanwhile to note that on Louis X's death the Salic law was never invoked as a ground for excluding Joan, his daughter by an earlier marriage, from the succession; and that his brother, the future Philip V, promptly convened an assembly of barons and prelates which invested him with the government of the kingdom and simply proclaimed, without adducing any proof, that women did not succeed in France: *Hoc tamen probari non poterat evidenter* ("this nevertheless could not be proved evidently"), as Jean de Saint-Victor wrote at the time. Consecrated as king on Jan. 9, 1317, Philip immediately convened a new assembly of prelates, barons and Parisian bourgeois, as it were an "assembly of notables," which ratified his accession without any contradictory discussion; and a year later, on March 27, 1318, Eudes, duke of Burgundy, Joan's uncle and guardian, renounced in her name all rights that she might have to the kingdoms of France and Navarre.

Neither Philip V, who died in 1322, nor his younger brother and successor, Charles IV, who died in 1328, left any sons; and in each case their daughters were tacitly excluded from the succession, no protest being made on their behalf. Charles IV, however, was the last male of the direct line of the Capetians; and on his death the question of the succession appeared in an entirely new light, since it had now to be determined whether the son of a French king's daughter who had herself been excluded from the succession by virtue of her sex could advance any claim to it on his own account. The claims of Edward III of England, grandson of Philip IV of France through the latter's daughter Isabella, and those of Charles II of Navarre, son of Louis X's daughter Joan, can be seen from the genealogical table in the article HUNDRED YEARS' WAR. What is certain is that there was still no reference to the Salic law when a new assembly of prelates, barons, and bourgeois designated Philip of Valois, representative of a junior line of the Capetians, to be king in succession to Charles IV. Two points, however, should be borne in mind as symptomatic of the confused state of the issue at that time: on the one hand, the *Grandes Chroniques de France* make it clear that the assembly's preference for Philip over Edward was founded on its abhorrence at the idea of France's passing under the rule of an English king, and that there was also an objection on the ground of feudal law, since the king of England was the French king's vassal for the duchy of Guienne and one could not be lord and vassal for a fief at one and the same time; on the other hand, the fact that Philip VI's accession had been determined by an assembly does not seem to have been used by any contemporary as an argument for calling in question the hereditary character of the French monarchy, which the Capetians had taken so long to promote.

Attempts to provide juridical grounds for the exclusion of women from the royal succession in France were made under Charles V—notably by the anonymous author of the *Somnium viridarii*—and in the last years of Charles VI's reign, when Jean de Terre-Vermeille began writing; but these writers derive their arguments in the first place from custom, in the second place from Roman law and from the priestly character of the kingship. It is noteworthy that when the first mention of the Salic law in connection with the exclusion of women occurs, namely in the memorandum submitted by the chronicler Jean Lescot to King John II and to his son the regent Charles in 1358, the writer declares that the legal experts whom he had consulted did not seem to know anything in it relevant to the question; and though the Salic law is again mentioned in Jean de Montreuil's polemical *Traité contre les Anglois* (1416), in an anonymous treatise of 1422, and by Jean Jouvenel des Ursins (1435), nevertheless the writers in each case resort finally to custom as the justification for excluding women.

At last, as late as 1464, there appeared an anonymous work entitled *La Loy salicque, premiere loy des François faicte par le roy Pharamon par laquelle est démonstré comme les femmes ne peuvent estre héritières de la couronne de France* ("The Salick Law, first law of the Franks, made by King Pharamond, whereby is shown how women cannot be heiresses to the crown of France"). First printed in 1488, this work was republished many times in the first six décades of the 16th century, notably as an appendix to editions of Claude de Seyssel's famous treatise *La Grant Monarchie de France* in 1541 and 1558. Yet here the anonymous writer, though he mentions the chapter "De alode" ("On Allodial Property") in the law of the Salian Franks, which declares that women could not inherit Salian land, nevertheless spends very little time on that chapter and is more concerned with the law of the Salians in general: his main purpose is to show how the *lex Salica*, as promulgated by Pharamond, was the first expression of the royal will, and how Charlemagne, who gave it its definitive form, conferred on it his own unrivaled prestige, and made it binding on succeeding French kings no less than on the kingdom of France as a whole. The author notes that since Pharamond's time no woman had succeeded to the throne of France, but the reasons which he adduces for this are in fact quite external to the text of the *lex Salica;* he gives more weight to the argument (already advanced by Jean de Terre-Vermeille) about the priestly character of the king, anointed as he was with the oil from the Sainte Ampoule on the day of his consecration (*see* CORONATION), and to the king's duty, which a woman could not perform, of defending the Oriflamme or sacred banner by force of arms.

The text of the Salic law, however, was taken up by statesmen and by expositors of the theory of the royal power in the 16th century and advanced as a fundamental law of the kingdom, with the exclusion of women from succession to the throne as one of its provisions. Thus when Francis I, on his return from captivity in 1526, declared that he was not obliged to execute the terms of the Treaty of Madrid, he was fully upheld by the Paris *parlement*, whose premier president, Jean de Selve, maintained that "by the Salic law, the rights of the crown are inalienable." In the same year Jacques Bonnaud de Sauset, in his edition of Jean de Terre-Vermeille's works, presented the Salic law as the basis of absolute monarchy and, in particular, of the absolute power of the kings of France. The same idea was later taken up by Guillaume Postel in his commentaries on the Salic law in *La Loy salique, livret de la première humaine vérité* (1552), in which he went so far as to assert that the word "Salic" must be the result of a misreading and that one ought really to speak of "the Gallic law." At the estates-general of the League, convened by the duc de Mayenne in Paris in June 1593, the authority of the Salic law was

expressly invoked to set aside the candidature of the infanta Isabella, granddaughter of Henry II of France by his daughter Elizabeth's marriage to Philip II of Spain, for the French throne—despite the strongly pro-Spanish attitude of the dominant faction in Paris at the time. Thenceforward the Salic law was invariably accepted as a fundamental law of the kingdom.

Yet the Salic law was not invariably cited, even in France, as the ground for excluding women from succession to the crown. Jean Bodin, in his *Methodus ad facilem historiarum cognitionem* (1566), remarks that, while the law might be supposed to be the most ancient constitutional law of the kingdom, the interpretation of it with regard to the succession was due to an error of the jurist Baldus de Ubaldis and others "who have confused the law of succession with sovereignty"; and Jean du Tillet, in his *Recueil des roys de France* (1580) insists that, if women are excluded from the succession in France, it is not because of any provision of the Salic law, which was written "for subjects only" or, in other words, was a code of private, not of public or constitutional law. This latter argument, however, overlooks the fact that in Merovingian times there was not yet any distinction between public and private law and that the rules for succession to the kingdom were not different from those for succession to private property. Moreover, for the Merovingians all male heirs had equal rights, whereas the later interpretation of the Salic law with regard to the royal succession was bound up with primogeniture.

The commentators on the Salic law insist on its being a law peculiar to the kingdom of France. However, the French allegation of the Salic law to justify the exclusion of women led to the loose but convenient use of the term Salic law to designate rules excluding women in other dynasties' systems of succession. In Germany, where the kingship was elective, there could in theory be no question of regulating a hereditary succession to the royal crown; and in theory too the Holy Roman emperor's monarchy was not hereditary. In other German principalities, however, the hereditary principle came to be established. Insofar as these principalities were based mainly on fiefs of the empire, the general rule under feudal law (*Lehnrecht*) excluded women at least in the so-called "masculine" fiefs, though in a few cases there were "feminine" fiefs to which a woman could succeed; but for allodial property the local law of the land (*Landrecht*) might allow female succession. Moreover, when a masculine fief fell vacant, the king would usually invest the husband of the heiress rather than anyone else with it. With the decline of feudalism and the consolidation of the sovereign status of the princes, family laws or *Hausgesetze* fixed the system of succession to the German principalities. These *Hausgesetze* generally either excluded women altogether or only allowed them to succeed if the entire male line of the dynasty should become extinct. For the Hohenzollerns of Brandenburg-Prussia, for instance, the succession was expressly confined to the male line: what should happen if the male line died out was uncertain. For the Habsburgs, female succession if the male line should have died out was carefully arranged under Charles VI's Pragmatic Sanction. It is this overriding preference for the male line that is meant by Salic law in German connections. When Victoria of Great Britain was excluded from the succession to the kingdom of Hanover on her uncle William IV's death, the "Salic law" involved was the *Hausgesetze* that preferred any male of the whole house of Brunswick-Lüneburg to any female for the Hanoverian succession, but would have allowed female succession if all such males had been extinct.

In England, in Scandinavia, and in Angevin Naples there was no principle against succession by daughters in default of sons. In Spain likewise there was no such principle until Philip V, the first Spanish king of the French Bourbon dynasty, introduced the Salic law by his *Auto acordado* of 1713. It was Ferdinand VII's final revocation of the *Auto acordado* by a codicil to his will of 1832 that provoked the Carlist Wars, as it set aside the claims of his brother Don Carlos by reverting to the old principle whereby his daughter Isabella could succeed. For the kingdom of Italy under the House of Savoy the Salic principle was accepted.

SALICYLIC ACID, a white, crystalline solid, is used, with its derivatives, in medicines and flavouring agents and in the manufacture of dyes. The largest single use is in the preparation of aspirin (*q.v.*).

Salicylic acid occurs naturally in small amounts in the roots, leaves, blossoms and fruits of many plants, particularly in the oils from various species of *Spiraea*. The methyl ester is widely distributed in nature in the roots, bark and leaves of plants and is the principal constituent of oil of wintergreen from the wintergreen shrub, *Gaultheria procumbens*.

Chemically, salicylic acid is orthohydroxybenzoic acid, $C_6H_4(OH)(COOH)$. It crystallizes from hot water in the form of white needles which melt at 159° C, and sublimes without decomposition at temperatures up to 155° C. It is very soluble in alcohol and ether, but soluble in water to the extent of only 1.8 g. per litre at 20° C and 20.5 g. per litre at 80° C. Salicylic acid decomposes at about 200° C into phenol and carbon dioxide. It develops a violet colour in aqueous solution with ferric chloride. In its chemical behaviour it undergoes the typical reactions of an aromatic carboxylic acid as well as a phenol. Salts, esters, ethers and acyl derivatives are readily prepared.

Preparation.—Salicylic acid was first prepared by R. Piria in 1838 by treating salicylaldehyde with potassium hydroxide. Until 1874 the only commercial source was the hydrolysis of the methyl salicylate obtained from the bark of sweet birch (*Betula lenta*) or the leaves of the wintergreen shrub. Large-scale manufacture was made possible by a synthesis discovered in 1859 by H. Kolbe in which phenol was treated with carbon dioxide in the presence of metallic sodium. In 1874 the method was modified to the treatment of dry sodium phenate with carbon dioxide at elevated temperature and pressure.

Commercial Preparation.—Phenol and a hot concentrated solution of sodium hydroxide in water are mixed in an autoclave and the solution heated to about 130° C. The resulting sodium phenate is dried by heating and stirring in the autoclave, initially at atmospheric pressure and then under reduced pressure. The dry pulverized sodium phenate is cooled to about 100° C, and continuously stirred while carbon dioxide is admitted to the autoclave under a pressure of approximately 100 lbs. per square inch. After the desired amount of carbon dioxide has been absorbed, the autoclave is heated at about 150° C for several hours and then cooled. The resulting sodium salicylate is dissolved in water and the solution acidified with mineral acid to precipitate crude salicylic acid, which is recovered by centrifuging and drying. The crude acid thus obtained is purified by recrystallization and sublimation.

Uses of Salicylic Acid and Derivatives.—Salicylic acid finds some use as a preservative in nonfood products, but its use in food is objectionable and is unlawful in many countries. Lotions, ointments and powders containing from 2% to 10% of the acid are used in the treatment of skin diseases.

Salicylic acid applied to unbroken skin causes a softening of the horny layer of the epidermis and hence is used as a wart, corn and callus remover.

Large quantities of crude salicylic acid are used in the manufacture of dyes such as monoazo mordant dyes, direct diazo and triazo dyes and mordant-type dyes of the triphenylmethane series.

The sodium salt of salicylic acid, sodium salicylate, is used medicinally as an antipyretic (an agent that relieves fever) and as an analgesic (an agent that alleviates pain), particularly in the treatment of rheumatic fever.

The largest use of salicylic acid is in the preparation of its acetyl derivative, aspirin, which is made by treating the acid with acetic anhydride. Aspirin is widely used both as an analgesic in the treatment of headache, neuralgia, etc., and as an antipyretic in the treatment of colds, flu, etc. The annual world-wide production

of acetylsalicylic acid is in the many millions of pounds.

The second largest use of salicylic acid is in the preparation of its methyl ester (synthetic oil of wintergreen). It is made by esterifying the acid with methyl alcohol, sulfuric acid being used as a catalyst. Methyl salicylate is widely used as a flavouring agent in confectionery, beverages, dentifrices, etc. Medicinally it is used externally as a counterirritant in ointments and lotions.

Phenyl salicylate, since it absorbs ultraviolet light, has been used in antisunburn creams. It is also used for enteric-coated (protected from absorption until reaching the intestine) pills. Salicylanilide is a fungicide and finds use as a mildewproofing agent for cotton articles.

SALIENTIA, the scientific term for the amphibian superorder that includes living frogs and toads (order Anura), and ancestral types (order Proanura). Some zoologists relegate Salientia to the rank of order, placing all forms in this group. In such a scheme Salientia becomes practically synonymous with Anura. *See* AMPHIBIA.

SALIERI, ANTONIO (1750–1825), Italian composer whose gifts are apparent both in his operas and in his sacred music, but whose memory has suffered at the hands of posterity, was born at Legnano on Aug. 18, 1750. In 1766 he was taken to Vienna by F. L. Gassmann, the imperial court composer and music director, who introduced him to the emperor Joseph II. His first opera, *Le donne letterate,* was produced at the Burgtheater in 1770. This was followed by a succession of operas, among them *Armida* (1771) which was enthusiastically received. On Gassmann's death in 1774 Salieri became *Kapellmeister,* and on G. Bonno's death in 1788 he was appointed *Hofkapellmeister.* He held court office for 50 years, during which time he made frequent visits to Italy and France and composed music for many European theatres, one such work being *Les Danaïdes* (Paris, 1784), commissioned by the Académie de Musique on Gluck's recommendation. His most important work was the opera *Tarare* (1787), later called *Axur, re d'Ormus,* which the Viennese public preferred to Mozart's *Don Giovanni.* Salieri's last opera was *Die Negersclaven.* After its production in 1804 he devoted himself to the composition of sacred music. In 1824 he retired from court office on full salary, and died in Vienna on May 7, 1825.

Throughout his life he remained on friendly terms with Haydn and with Beethoven, whom he had given lessons in counterpoint and who dedicated the three violin sonatas, Op. 12, to him. Salieri was distrusted by Mozart; there is, however, no foundation for Mozart's belief that Salieri had tried to poison him—a legend that formed the basis of Rimski-Korsakov's opera *Mozart and Salieri* and of Cedric Glover's novel, *The Mysterious Barricades* (1964).

See G. Magnani, *Antonio Salieri* (1934). (Cs. CH.)

SALII ("the dancers"), an age-old priesthood found in classical antiquity in a group of central Italian towns (Alba, Anagnia, Aricia, Lavinium, Tibur, Tusculum) and at Rome. They are normally associated with the worship of Mars, the god of war, though at Tibur they celebrated Hercules, the dominant deity. At Rome the Salii consisted of two groups of 12, with separate sodality houses, the Palatini, who worshiped Mars, and the Collini (or Agonenses), who originally worshiped Quirinus. They had to be of patrician birth, with both father and mother living. They were normally young men, and resignation from the priesthood was common on assuming high political office, which might conflict with the punctilious discharge of priestly duties. Vacancies were filled by co-option. The priests wore a distinctive costume, including a short military cloak of vivid red with bronze breastplate beneath a conical helmet, and carried the ancile (a shield in the shape of a figure-of-eight) and the old-fashioned long spear. This is the archaic Roman war dress, and there is little doubt that the Salii represented a section of the early Roman army.

The priesthood was most active in March (Mars's month and the beginning of the campaigning season) and in October (when summer campaigns were wound up). Their chief festivals were the Quinquatrus on March 19 and the Armilustrium on Oct. 19. The Salii moved in procession through the city along a traditional route, stopping for the night at appointed stations, where they stored their arms and feasted, the luxury of their banquets becoming proverbial. At specified points they paused to perform ritual dances in triple time under their leader (*praesul*), beating their shields with their spears and singing their traditional song transmitted from an antiquity so remote that its formulas and languages were largely unintelligible in classical times. There still survive a few fragments of their *Carmen Saliare,* a primitive war chant meant to enlist Mars's support and ensure victory.

In later times the character of these ceremonies changed. The ancilia came to be regarded as magical relics and the *Carmen Saliare* as a community prayer on behalf of the Roman state, so that the names of members of the imperial house could be inserted. Existence of Salii is attested in several towns of Cisalpine Gaul and at Saguntum, where they were almost certainly instituted in imitation of the Roman priesthood.

SALINA, a city of central Kansas, U.S., 75 mi. NW of Wichita, is located on the Smoky Hill River near its confluence with the Saline; the seat of Saline County. Salina is a distribution and trade centre for the great central Kansas wheat-growing area; grain milling is the chief industry and there are extensive facilities for the storage and processing of wheat. The city was founded in 1858 by Col. William A. Phillips; much of its early trade was with Indians and settlers and with soldiers from nearby Ft. Riley. By 1862, however, only about 12 families lived there; the first real growth of the community came with the arrival of the Kansas Pacific (part of the Union Pacific) railway in 1867. The city was chartered in 1870. It has a council-manager form of government, in effect since 1921. Kansas Wesleyan University (Methodist, established 1885), Marymount College (Roman Catholic, 1922), and St. John's Military School (Episcopal, 1887, a private preparatory school for boys) are among the educational institutions in Salina. Schilling Air Force Base (formerly Smoky Hill Air Base) is near the city. For comparative population figures *see* table in KANSAS: *Population.* (D. P. G.)

SALINAS (Y SERRANO), PEDRO (1891–1951), Spanish poet, scholar, playwright, and essayist, one of the outstanding writers of a famous generation, was born in Madrid on Nov. 27, 1891. After studying and lecturing in Paris, in 1918 he became professor of Spanish at Seville. He there became known both as poet and scholar, publishing two volumes of poetry, *Presagios* (1923) and *Seguro azar* (1929); a critical edition of Juan Meléndez Valdés (1925); and a modern rendering of the *Poema del Cid* (1925). The appearance of *La voz a ti debida* (1934), perhaps the greatest modern Spanish love poem, established him as one of the leading poets in Spanish of the first half of the 20th century. Meanwhile, he had become professor at Madrid (1930), and received various honours from the government. In 1936, on the outbreak of the Spanish Civil War, he went to the United States, where he lectured at Wellesley College, Mass., and, after 1940, at the Johns Hopkins University, Maryland. He died at Boston, Mass., on Dec. 4, 1951. The works published in America reveal his many-sided talents. In the poems in *El Contemplado* (1946; Eng. trans. *Sea of San Juan: a Contemplation,* 1950) and *Todo más claro* (1949), he primarily expresses the exile's longing for his native country; and in *El Defensor* (1948), a volume of essays, and in his literary studies, *Jorge Manrique o tradición y originalidad* (1947) and *La poesía de Rubén Darío* (1948), he shows a profound human concern and personal anguish at the experiences of a tragic age.

Translations include *Lost Angel and Other Poems* (1938), *Truth of Two* (1940), and *Zero* (1947). (Ju. MA.)

SALINAS, a city in western California, U.S., the seat of Monterey County, is situated near the Pacific Ocean, about 10 mi. from Monterey Bay and less than 100 mi. S of San Francisco. The city lies on a broad plain which is just above sea level and which extends southward for 50 mi. along the Salinas River, so named because of the salt pools along its lower course. This area is protected by the Coast range and the Gabilans on the east and the Santa Lucias on the west. The original site of Salinas and its growth were determined by the route of the Southern Pacific Railroad. Settlement on El Camino Real, now a U.S. highway, began in the 1850s and the town was incorporated in 1874. It adopted the city-manager form of government in 1936. The economy is mostly agricultural, the valley being under irrigation except for the foothills which are used for grazing and dry-land farming. Salinas is the shipping centre for vegetables, including beets, lettuce, celery, broccoli, cauliflower, spinach, artichokes, peas, and onions. Some fruits are grown, especially strawberries. The production of sugar beets, once the primary crop, centres around the largest sugar beet factory in the United States. Many beets are still grown in the valley and tons are also shipped in from adjacent and remote valleys, thereby keeping the factory at high-level production for several months each year. Salinas is the centre of a bulb and seed industry, with experimentation and production possible all year because of the excellent climate and fertility of the soil. It is the home of Hartnell College (1920), a public junior college. Salinas is widely known as the home of the annual California rodeo. For comparative population figures *see* table in CALIFORNIA: *Population.* (B. L. B.)

SALINGER, JEROME DAVID (1919–), U.S. writer, whose novel *The Catcher in the Rye* was a major influence on the post-World War II generation and its novelists, was born in New York City on Jan. 1, 1919. After brief periods at New York and Columbia universities, he devoted himself entirely to writing, except for service in the U.S. Army (1942–44). His popular, somewhat sentimental stories began to appear in periodicals in 1940; those written after the war frequently exploited his army experiences. "For Esmé—with Love and Squalor" (1950), set in England, tells the poignant tale of an encounter of an American soldier and two British children; "A Perfect Day for Bananafish" (1948) describes the suicide of the sensitive, despairing veteran, Seymour Glass. But Salinger's major work was *The Catcher in the Rye* (1951), in which the central character, Holden Caulfield, relates in an authentic, teen-age idiom his flight from the hypocrisies of the adult world, his search for innocence and truth, and his final collapse on a psychiatrist's couch. The novel's language and humour placed it in the native tradition of Mark Twain's *Huckleberry Finn.* From the beginning it attracted devoted admirers and serious critics. *Nine Stories* (1953), a selection of Salinger's best work, added to his reputation. After 1953 his work declined in quality and quantity. *Franny and Zooey* (1961) reprinted two *New Yorker* stories of 1955 and 1957; both deal with the Glass family, as do the two stories in *Raise High the Roof Beam, Carpenters; and, Seymour: an Introduction* (1963). Salinger appears at his best in his dramatization of children; all of his work seems haunted with the lost innocence of childhood. (J. E. MR.)

SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF (1861–1947), British statesman and extreme right-wing Conservative politician, was born in London on Oct. 23, 1861, the eldest son of Lord Robert Cecil. Styled Viscount Cranborne from 1868 when his father became the 3rd marquess of Salisbury, he was educated at Eton and at University College, Oxford. As a member of the House of Commons (1885–92 and 1893–1903), he won a reputation as a zealous defender of the Established Church. He served with distinction in the South African War (1899–1902), but was recalled in 1900 to become undersecretary for foreign affairs. Succeeding as the 4th marquess of Salisbury in August 1903, he entered A. J. Balfour's cabinet in October as lord privy seal, and became president of the board of trade in March 1905. Deeply conservative, he was a natural "diehard" in the crisis over the budget of 1909 and the Parliament Bill of 1911 (*see* ENGLISH HISTORY), voting against both to the end. During World War I he did not join either of the coalition governments and remained critical of both.

After 1918 he gradually assumed the informal leadership of the Conservative opposition, first in the House of Lords and afterward in the party generally. In a speech on Oct. 17, 1922, he demanded that the Conservative party free itself from supporting the coalition government. Two days later his policy was accepted at the Carlton Club meeting. In the cabinet of Andrew Bonar Law, which replaced the coalition in November 1922, Salisbury was lord president of the council and chancellor of the duchy of Lancaster. He was appointed in March 1923 chairman of a subcommittee to consider the coordination of home and imperial defense, and his valuable recommendations became the basis of the British military organization until after World War II.

In Stanley Baldwin's second cabinet (1924–29) he was lord privy seal and from 1925 to 1929 was leader of the House of Lords. Gradually alienated, however, by Baldwin's "liberalism," he resigned his leadership of the Conservative peers in June 1931, stayed out of the National government formed in August, and devoted his energies to vain endeavours to reform (*i.e.,* strengthen) the House of Lords and to oppose self-government for India. He was more successful in his efforts, in company with Winston Churchill, to organize British defenses against Hitler. From 1942 to 1945 he was president of the National Union of Conservative and Unionist Associations. Salisbury died in London on April 4, 1947.

(H. G. N.)

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUESS OF (1830–1903), British statesman and prime minister (1885–86, 1886–92, 1895–1902), who also acted as foreign secretary at a time when the British Empire was rapidly expanding, was born at Hatfield House, Hertfordshire, on Feb. 3, 1830, the third son of James, 2nd marquess, by his first wife, Frances Mary Gascoyne. Lord Robert Cecil, as he was then styled, was educated at Eton and Christ Church, Oxford. His scholastic career was cut short by ill health and in July 1851 he was sent on a journey round the world. He returned to England in May 1853 and in August was elected unopposed to Parliament for Stamford, in Lincolnshire. In his early years, however, he was more active as a writer than as a politician, and he contributed to the *Quarterly Review* a total of 32 unsigned articles, the most notable of which dealt with foreign affairs or were biographical sketches. In 1864 Cecil began to take an active part in parliamentary life, as an uncompromising Conservative. In the next year his elder brother James died and he took the courtesy title of Viscount Cranborne as heir to his father. In July 1866 he was appointed secretary of state for India, but in the following year he quarreled with the prime minister, Lord Derby, and with Disraeli over the second Reform Bill, and resigned in March 1867.

RADIO TIMES HULTON PICTURE LIBRARY

THE 3RD MARQUESS OF SALISBURY

His father died in 1868 and he succeeded as the 3rd marquess of Salisbury; all but the first 15 years of his political career were therefore spent in the House of Lords, where until 1874 he was in opposition during Gladstone's first ministry. When Disraeli became prime minister (1874) his first care was to secure the services of Salisbury, who was reluctant to work under a man whom he distrusted; but he was persuaded to resume his post of secretary of state for India. He took drastic measures to fight a serious famine in that country. Two years later a crisis arose in southeast Europe, and Salisbury began the close association with foreign policy which was to last for the rest of his life.

The Eastern Question.—The Bulgars rebelled in 1876 against

of acetylsalicylic acid is in the many millions of pounds.

The second largest use of salicylic acid is in the preparation of its methyl ester (synthetic oil of wintergreen). It is made by esterifying the acid with methyl alcohol, sulfuric acid being used as a catalyst. Methyl salicylate is widely used as a flavouring agent in confectionery, beverages, dentifrices, etc. Medicinally it is used externally as a counterirritant in ointments and lotions.

Phenyl salicylate, since it absorbs ultraviolet light, has been used in antisunburn creams. It is also used for enteric-coated (protected from absorption until reaching the intestine) pills. Salicylanilide is a fungicide and finds use as a mildewproofing agent for cotton articles.

SALIENTIA, the scientific term for the amphibian superorder that includes living frogs and toads (order Anura), and ancestral types (order Proanura). Some zoologists relegate Salientia to the rank of order, placing all forms in this group. In such a scheme Salientia becomes practically synonymous with Anura. *See* AMPHIBIA.

SALIERI, ANTONIO (1750–1825), Italian composer whose gifts are apparent both in his operas and in his sacred music, but whose memory has suffered at the hands of posterity, was born at Legnano on Aug. 18, 1750. In 1766 he was taken to Vienna by F. L. Gassmann, the imperial court composer and music director, who introduced him to the emperor Joseph II. His first opera, *Le donne letterate,* was produced at the Burgtheater in 1770. This was followed by a succession of operas, among them *Armida* (1771) which was enthusiastically received. On Gassmann's death in 1774 Salieri became *Kapellmeister,* and on G. Bonno's death in 1788 he was appointed *Hofkapellmeister.* He held court office for 50 years, during which time he made frequent visits to Italy and France and composed music for many European theatres, one such work being *Les Danaïdes* (Paris, 1784), commissioned by the Académie de Musique on Gluck's recommendation. His most important work was the opera *Tarare* (1787), later called *Axur, re d'Ormus,* which the Viennese public preferred to Mozart's *Don Giovanni.* Salieri's last opera was *Die Negersclaven.* After its production in 1804 he devoted himself to the composition of sacred music. In 1824 he retired from court office on full salary, and died in Vienna on May 7, 1825.

Throughout his life he remained on friendly terms with Haydn and with Beethoven, whom he had given lessons in counterpoint and who dedicated the three violin sonatas, Op. 12, to him. Salieri was distrusted by Mozart; there is, however, no foundation for Mozart's belief that Salieri had tried to poison him—a legend that formed the basis of Rimski-Korsakov's opera *Mozart and Salieri* and of Cedric Glover's novel, *The Mysterious Barricades* (1964).

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUESS OF (1830–1903), British statesman and prime minister (1885–86, 1886–92, 1895–1902), who also acted as foreign secretary at a time when the British Empire was rapidly expanding, was born at Hatfield House, Hertfordshire, on Feb. 3, 1830, the third son of James, 2nd marquess, by his first wife, Frances Mary Gascoyne. Lord Robert Cecil, as he was then styled, was educated at Eton and Christ Church, Oxford. His scholastic career was cut short by ill health and in July 1851 he was sent on a journey round the world. He returned to England in May 1853 and in August was elected unopposed to Parliament for Stamford, in Lincolnshire. In his early years, however, he was more active as a writer than as a politician, and he contributed to the *Quarterly Review* a total of 32 unsigned articles, the most notable of which dealt with foreign affairs or were biographical sketches. In 1864 Cecil began to take an active part in parliamentary life, as an uncompromising Conservative. In the next year his elder brother James died and he took the courtesy title of Viscount Cranborne as heir to his father. In July 1866 he was appointed secretary of state for India, but in the following year he quarreled with the prime minister, Lord Derby, and with Disraeli over the second Reform Bill, and resigned in March 1867.

THE 3RD MARQUESS OF SALISBURY

His father died in 1868 and he succeeded as the 3rd marquess of Salisbury; all but the first 15 years of his political career were therefore spent in the House of Lords, where until 1874 he was in opposition during Gladstone's first ministry. When Disraeli became prime minister (1874) his first care was to secure the services of Salisbury, who was reluctant to work under a man whom he distrusted; but he was persuaded to resume his post of secretary of state for India. He took drastic measures to fight a serious [illegible] in that country. Two years later a crisis arose in southeast [illegible] and Salisbury began the close association with foreign [illegible]ich was to last for the rest of his life.

[illegible]stern Question.—The Bulgars rebel[illegible]

the suzerainty of Turkey and the rising was suppressed with great cruelty. Gladstone advocated the expulsion of the Turks from Europe "bag and baggage," and Russian volunteers poured into the Balkans to help the insurgents. After Turkey had rejected (January 1877) proposals made at a conference of the great powers of Constantinople (at which Salisbury was the British representative), Russia declared war and invaded Turkey (*see* EASTERN QUESTION). By the Treaty of San Stefano (March 3, 1878) the Russians forced the Turks to place their Balkan territories under Russian suzerainty. The British cabinet refused to admit the treaty's validity. The army reserves in England were called out and Indian troops were ordered to proceed to Malta. The 15th earl of Derby disapproved of these measures and resigned the foreign office. Disraeli (now earl of Beaconsfield) thereupon appointed Salisbury to take his place, and the very next day (April 1, 1878), before he had been formally gazetted as foreign secretary, he telegraphed to all the great powers a dispatch, which came to be known as the Salisbury Circular, and which insisted that the position of Turkey in Europe was a matter of concern to all the powers and could not be determined by Russia alone. Despite the Turkish atrocities Salisbury held that the independence of Turkey must be maintained. His Liberal rival, the earl of Rosebery, called the dispatch "one of the historic state papers of the English language." It rallied the major powers to the British view that the future of the Balkans could only be decided at a European congress. The German chancellor, Prince von Bismarck, thereupon proposed that the congress should be held in Berlin. It met there on June 13 with Bismarck presiding. Prince A. M. Gorchakov represented Russia, and Beaconsfield and Salisbury attended for Britain (*see* BERLIN, CONGRESS OF).

Salisbury had carefully prepared the ground by negotiating secret treaties first with Russia (May) and then with Turkey (June), Turkey agreeing to lease Cyprus to Britain as a base for military or naval action in its own support. Most of the points made in Salisbury's Circular note were approved at the congress, and on their return to London after the signing of the Treaty of Berlin (July 13, 1878), the two British delegates were greeted with enthusiasm and Beaconsfield's claim that they had brought back "peace with honour" was heartily accepted. Two unhappy minor wars, however, in Afghanistan (1878–80) and Zululand (1879) now dimmed the earlier successes of the government, and at the general election in 1880 Gladstone gained a substantial majority.

First Ministry (1885–86).—The Liberal success had been furthered by Gladstone's brilliant Midlothian campaign (1879–80) denouncing the Turkish atrocities in Bulgaria. Gladstone's domestic measures proved popular, but his foreign policy lost Britain her friends abroad and his colonial policy was disastrous, culminating in the loss of the Anglo-Egyptian Sudan and the murder of Gen. C. G. Gordon at Khartoum (Jan. 26, 1885). In a snap division on the budget in June 1885 Gladstone was defeated, and Queen Victoria summoned Salisbury. He accepted the premiership unwillingly, knowing that he would be dependent for a majority on the supporters of Home Rule for Ireland (*see* PARNELL, CHARLES STEWART). He kept the foreign office in his own hands, and again won success for his country. The two states, Bulgaria and Eastern Rumelia, into which the old Bulgaria had been divided by the Treaty of Berlin, united in September 1885 to call Prince Alexander of Battenberg, the head of the new, reduced Bulgaria, to be ruler of a united Bulgaria. While Russia and the other signatories of the treaty wished to re-enforce the arrangement made at Berlin, Salisbury accepted the Bulgars' desire for unification and persuaded the other powers to do the same. But his government was defeated in Parliament on Jan. 26, 1886, Gladstone having secured the Irish vote by his promise of Home Rule. In Gladstone's third ministry (February–July 1886) his Home Rule bill was rejected on June 8 when 93 of his Liberal followers announced themselves to be Unionists and voted with the Conservatives. Parliament was dissolved, and the general election gave Salisbury a majority dependent upon the Liberal Unionists. Salisbury first suggested to their leader, the marquess of Hartington (later 8th duke of Devonshire), that he should take the premiership; on his refusal, Salisbury himself took office on July 25, 1886, and formed his second government, which was to remain in office for six years. The Liberal Unionists followed Hartington in refusing to join the cabinet.

Second Ministry (1886–92).—The earlier months of Salisbury's new ministry were inauspicious. Apart from Irish obstruction of business in the House of Commons, difficulty was caused in the cabinet by the tempestuous personality of Lord Randolph Churchill, whom Salisbury had appointed chancellor of the exchequer. Churchill soon came into collision with the more sedate service ministers, William Henry Smith and Lord George Hamilton, over their departmental estimates which he wanted to reduce. The prime minister supported Smith and Hamilton, and Churchill resigned in December 1886. The loss of this brilliant leader of the House, who was popular in the country and was also the link between the Conservatives and the Liberal Unionists, seemed to shake the ministry to its foundations. Salisbury, however, was unperturbed; he appointed one of the former Liberals, George Joachim (later Viscount) Goschen, to be chancellor, and himself took over the foreign office (Jan. 14, 1887), which he had first entrusted to the earl of Iddesleigh. There his immediate care was to reestablish good personal relations with Bismarck, the outstanding statesman of Europe, an eminence to which Salisbury succeeded when the latter was arbitrarily dismissed by William II (March 1890).

Bismarck had more than once urged the British government to join the Triple Alliance (Germany, Austria-Hungary, and Italy), and his disappearance made it easier for Salisbury to maintain an independent position in European affairs, following a policy which later came to be known by the phrase "splendid isolation," although he himself never employed the term. During the whole of this second ministry foreign policy was largely dictated by colonial questions. The race among the European nations to obtain territory in Africa caused Salisbury to find himself at loggerheads sometimes with the Germans or with the Portuguese, and all the time with the French. Behind the rush of explorers, missionaries, and traders stood the governments of their respective countries. Salisbury's policy was to establish agreed and separate spheres of influence. The British part in colonization was carried out by chartered companies, directed by such pioneers as Cecil Rhodes, and usually supported by regular or irregular forces. Salisbury was at first a reluctant imperialist, but by the end of his career he had added enormous stretches of territory to the British Empire; and he was the less loath to colonize because he made it an absolute rule that the slave trade should be prohibited in any territory administered by Great Britain. Since Germany was less fastidious in this respect, negotiations were complicated and long-drawn-out; in Southwest Africa also, for different reasons, settlement was hard to reach. Finally, on July 1, 1890, Great Britain agreed to cede the island of Heligoland and some territory in Southwest Africa to Germany, in exchange for the explicit recognition of British sovereignty over territories in East Africa which gave control of the upper waters of the Nile.

Negotiations with Portugal over central Africa (1889–91) were even sharper. Salisbury endowed Cecil Rhodes's British South Africa Company with a royal charter in 1889, and when Rhodes's forces south of Lake Nyasa came into contact with those of Portugal, which sought to establish a Portuguese belt from West to East Africa, Salisbury dispatched what amounted to an ultimatum to Lisbon (January 1890), demanding the withdrawal of the Portuguese forces. Portugal yielded and a treaty signed on June 11, 1891, secured for Rhodes the territory later known as Rhodesia, with Salisbury (founded in 1890 and named after the prime minister) as its capital. Colonial rivalry with France in West Africa was less severe. In the agreements of 1889 and 1890 between Britain and France the respective boundaries of the colonial territories were regularized, leaving Gambia, Sierra Leone, and the Gold Coast to Britain, and a vast area covering part of the Congo basin and the western Sahara to France.

As usual when Salisbury was prime minister the output of domestic legislation was small, and during the whole of his second premiership parliamentary business was impeded by the obstructive tactics of the Irish members, who were goaded by the repressive measures taken by the government against the frequent Fenian

outrages in Ireland. Time was found, however, for the important Local Government Act (1888), which established county councils throughout England and Wales (including notably the London County Council), and also for a Free Education Act (1891), Salisbury considering that since the previous Liberal government had made education compulsory it was for the government to take over from the parents the payment of the fees. His outlook on the "working man" had been succinctly expressed in the general election of 1885. "The Conservative," he said, "points the working man forward to obtain wealth which is as yet uncreated: the Radical, on the contrary, does not tell him to create new sources of wealth, but says that the wealth which has already been obtained is badly divided." Nevertheless he drew large audiences when he spoke in industrial centres like Manchester or Glasgow, and became noted for his unexpected homeliness of speech. When Salisbury's second ministry had almost run its course, the general election of 1892 gave the Liberals a working majority, with first Gladstone and then the earl of Rosebery as prime minister. But Gladstone's bill for the disestablishment of the Welsh Church and his second Home Rule bill (1893) were not popular and were rejected by the House of Lords. After Rosebery resigned (June 1895), Salisbury was returned to power in the election that immediately followed.

Third Ministry (1895–1902).—The Liberal Unionists now abandoned their independent position and the new cabinet was strengthened by the inclusion of the duke of Devonshire as lord president of the council and of Joseph Chamberlain as colonial secretary. Combining once more the foreign office with the premiership, Salisbury was able to give almost undivided attention to foreign affairs. He was faced at once with a violent outbreak of Turkish cruelty in Armenia and was now hampered by the pro-Turkish policy of Germany under William II, who was scheming for German expansion in the Persian Gulf. Salisbury, however, persuaded the great powers in 1896 that reforms should be enforced on Turkey (though no action was in fact taken); and he recreated the idea of the "Concert of Europe," the cooperation of the great powers to maintain peace.

Although the powers did intervene in 1897 in a quarrel over Crete, claimed by Greece from Turkey, the existence of the "Concert" was short-lived. The competition for predominance in Egypt still separated England and France; and in the winter of 1897–98 Russia seized two Chinese ports, Port Arthur (Lü-shun) and Talien (Dairen). Salisbury, however, refused to become embroiled in the Far East, for along with his other commitments there had arisen since 1895 a sharp and unexpected quarrel with the United States over a frontier dispute between Venezuela and British Guiana, the only British colony on the South American mainland. Pres. Grover Cleveland claimed the right of the United States to apply the Monroe Doctrine (*q.v.*). Salisbury, when it suited him, was a master of "do-nothing" diplomacy and in spite of angry speeches and press articles on both sides of the Atlantic he remained inactive in public while closely studying the details of the disputed boundary. He composed at leisure a long dispatch which he sent in November 1895 to the American secretary of state, Richard Olney, maintaining that the Monroe Doctrine was not applicable in this case. President Cleveland responded in a fierce speech to Congress (Dec. 17). The prince of Wales (later Edward VII) wrote an appeasing letter to Joseph Pulitzer, owner of the *New York World*, whom he knew; Chamberlain, with his American wife, Mary, paid a "private" visit to the United States; Pulitzer described the Cleveland policy as "jingo bugaboo," and American public opinion came round to Salisbury's view when he suggested a joint Anglo-American commission with a neutral chairman (February 1897). The committee finally presented its report in October 1899 and the chosen frontier differed little from that proposed by Salisbury.

In the meantime Salisbury had to deal with the hostility of European opinion after the buccaneering raid of L. S. Jameson (*q.v.*) in South Africa (December 1895), which was followed by the South African War (1899–1902); and he had come to the verge of war with France owing to the collision of the two countries' interests on the upper waters of the Nile. A French secret expedition under Comdt. J. B. Marchand had set out from West Africa to march eastward and establish French hegemony on the upper Nile (1896–98). Britain had agreed with the khedive of Egypt, Abbas II, to redeem the Sudan from the chaos and misgovernment it had suffered after the death of General Gordon, and to link the fate of the Sudan with that of Egypt. The aims of the two European governments were incompatible. Gen. Sir Herbert (later Earl) Kitchener was sirdar (commander in chief) of the Egyptian army, and with an Anglo-Egyptian force he marched up the Nile, defeated the dervish Khalifa 'Abdullahi at Omdurman (Sept. 2, 1898), and on the secret instruction of Salisbury then proceeded up the White Nile as far as Fashoda (now Kodok), where he met Marchand. After a cold, polite exchange of words it was agreed to leave negotiations to London and Paris. It was the age of jingoism in both capitals. But the French foreign minister, Théophile Delcassé, was as determined as Salisbury that there should be no war. It was agreed to regard Marchand only as an explorer and in November he was given facilities to retire from the Sudan via Abyssinia. An Anglo-Egyptian condominium was established over the Sudan in January 1899.

The sum of home legislation was again small during Salisbury's third ministry. A Merchant Shipping Act (1897), which fixed the loading line for ships, was its chief item. But it is noticeable that a private member's women's suffrage bill received a second reading in the House of Commons, and Salisbury, considered old-fashioned in his outlook, was by no means unfavourable to its proposals. In 1898 the Local Government Act for Ireland found its way to the statute book, as well as one or two minor measures.

During this last period of office Salisbury was, as usual, more concerned with foreign than with home affairs. In 1898 he had serious trouble with his own followers, A. J. Balfour and Chamberlain. He was in the habit of taking two holidays abroad every year, and on this occasion he left Balfour in charge of the foreign office. Chamberlain, however, was the dominant member of the cabinet, and persuaded Balfour to make an agreement and to sign a secret treaty (August 1898) with Germany according to which, if Portugal could not maintain the integrity of her colonies, these were to pass to Britain and Germany in exchange for financial support. Hearing of this proposition on his return from the south of France, Salisbury was very angry. He summoned the Portuguese ambassador, the popular marquês de Soveral, and denounced the pact concluded by his subordinates. In the so-called Windsor Treaty (Oct. 14, 1899), he re-engaged Britain to defend and protect all colonies and conquests belonging to the crown of Portugal against all its enemies. In appeasement of Germany he agreed (December 1899) to cede Britain's rights in the Samoa Islands in part to Germany and in part to the United States, the two countries with which Britain had shared a virtual protectorate over the islands since 1889. In return, British rights in Tonga and the Solomon Islands were specifically recognized. He also agreed not to impede Germany in her project of constructing a railway across Asia Minor from Constantinople to Baghdad. But he would not allow Russia to have a "sphere of influence" there; and he concluded with the sheikh of Kuwait, who ruled at the head of the Persian Gulf, a secret agreement (1899) by which the sheikh agreed not to cede any part of his territory. In the following year, after the murder of the German minister in Peking, Salisbury added a British contingent to the European force under the command of a German field marshal, Graf Waldersee, which marched to Peking to avenge the outrage and to crush the so-called Boxers who had risen against the European settlers in China.

On Oct. 11, 1899, the South African War broke out between Great Britain and the two Boer republics, the Transvaal and the Orange Free State. For the first few months the meagre British forces were defeated in one engagement after another; Britain's unpopularity on the continent of Europe was manifested by the united hostility of its governments and press. The two leading British generals, Frederick S. (later Earl) Roberts and Kitchener, were sent to South Africa in December 1899 to direct the campaign with the help of reinforcements, and thereafter it became only a matter of time before the Boers were defeated (*see* SOUTH AFRICAN WAR).

Salisbury's government was returned to power in the "khaki

election" (October 1900), and in November, aged 70, Salisbury handed over the foreign office to the marquess of Lansdowne. The latter, convinced that the days of "isolation" were past, was at first inclined to further Chamberlain's policy of alliance with Germany, but was dissuaded by a long and forcible state paper from Salisbury (May 29, 1901). Salisbury, however, warmly supported Lansdowne when the latter proposed a treaty of alliance with Japan, which was signed in January 1902; he was willing to oppose Russia in the Far East and the Middle East, but was all his life unwilling to sign a treaty which might involve him in a European war. These were his last decisions. After a peace treaty had been signed with the Boers (May 1902), by which the two republics were incorporated into the British Empire, he resigned on July 11, 1902, and surrendered the premiership to his nephew, A. J. Balfour. Worn out, he retired to Hatfield, where he died on Aug. 22, 1903. He was buried in Hatfield churchyard.

Character.—Salisbury was the last British statesman to govern Britain from the House of Lords, and the last (except for J. Ramsay MacDonald during a brief period) to combine the foreign office with the premiership. His death marked, politically, the end of the Victorian Age (though Queen Victoria had predeceased him, in January 1901). He stood for a paternal form of government which had become outmoded; and at the next general election (1905), the Liberals gained an overwhelming majority. Salisbury was a singular compound of hard common sense and idiosyncrasy. He suffered miserably at Eton, which he left prematurely and only once visited in later life. Nor was he much happier at Oxford, where his ill health, brought about by a nervous disorder, was a constant worry. All this changed in 1857 when he married Georgina, the eldest daughter of Sir Edward Alderson, a baron of the exchequer, and his ultimate success must largely be credited to his wife's understanding and loving care. She first encouraged him to make politics his career and was an immense help to him both as a counselor and as the dispenser of hospitality at Hatfield, to which most of the distinguished men of the day went for a weekend or garden party at one time or another. Much of Salisbury's spare time was spent with his family at Hatfield, where he also did a great deal of his official work, enjoying the isolation from public affairs. He was a big man, 6 ft. 4 in. in height, and felt the need for regular exercise; he often played tennis in the hard court at Hatfield and took long walks in the grounds. In later life his favourite exercise was tricycling, for which purpose he tarred most of the paths near the house.

Deeply interested in science, he spent many hours in the laboratory he built in the basement of Hatfield. There he carried out his experiments and indulged in his hobby of photography. He also experimented with electricity and through his enterprise Hatfield could claim to be the first private house in Great Britain to be equipped with electric lighting. His laboratory work was regarded seriously by eminent scientists of the day, and a well-earned tribute to his scholarship, and one which he valued above all others, was his appointment as chancellor of Oxford University in 1869. He combined his love of science with a devout religious belief, and his humility forbade him to take any credit for the successes he achieved in the course of his career. In diplomacy he could be very subtle, or very direct, as circumstance demanded. In both home and colonial affairs his statesmanship had a negative character. He did not originate. He was the pilot of the ship of state and not its engine; yet while he was in charge some 6,000,000 sq.mi. (15,540,000 sq.km.) were added to the British Empire and its population increased by approximately 100,000,000. Queen Elizabeth I had called his ancestor, the great Lord Burghley, her "spirit"; Salisbury might equally be called the "spirit" of the Victorian Age.

Salisbury had three daughters, Beatrix Maud (whose husband was the 2nd earl of Selborne), Gwendolen and Fanny Georgina (who died in infancy), and five sons, all of whom gained distinction in public life: James Edward Hubert Gascoyne-Cecil, 4th marquess of Salisbury, Edgar Algernon Robert Cecil, 1st Viscount Cecil of Chelwood (*qq.v.*), Hugh Richard Heathcote Gascoyne-Cecil, Baron Quickswood, Edward Herbert Gascoyne-Cecil, who served in the governments of Egypt and the Sudan, and William Rupert Ernest Gascoyne-Cecil, bishop of Exeter. Salisbury's *Speeches*, edited by H. W. Lucy, were published in 1885 and his *Essays*, reprinted from the *Quarterly Review*, in two volumes in 1905.

(A. L. KE.)

SALISBURY, ROBERT CECIL, 1ST EARL OF (1563–1612), English statesman, secretary of state from 1596 to 1612 and lord high treasurer from 1608 to 1612, was born in London on June 1, 1563, the second surviving son of William Cecil, Baron Burghley. His mother was Burghley's second wife, Mildred, daughter of Sir Anthony Cooke, tutor to Edward VI, and sister to Ann, Sir Francis Bacon's mother. Robert Cecil was educated at home and at St. John's College, Cambridge, for an unknown period around 1581. He was given his M.A. degree in 1605, although he had been steward of the university from 1591 and was chancellor from 1601 until his death. He was admitted to Gray's Inn in 1580. He went to the Spanish Netherlands in 1588 with the 4th earl of Derby's mission which tried to negotiate a peace with the duke of Parma. He was married on Aug. 31, 1589, to Elizabeth Brooke, daughter of William, Lord Cobham. After Sir Francis Walsingham's death in 1590, Cecil gradually took over the work of the secretaryship of state, although not formally appointed to that office until July 5, 1596. He had been knighted and sworn of the privy council in 1591. He was elected to Parliament for Westminster in 1584 and 1586, and for Hertfordshire in 1588, 1592, 1597, and 1601, and was the official exponent of government policy in the House of Commons from 1593 until 1603, when he was created Baron Cecil of Essendine, in Rutland, and then in the House of Lords. Early in 1598 he headed a mission to Henry IV of France to try to prevent the inclusion of anything prejudicial to the English or Dutch in the Treaty of Vervins (May) between France and Spain. After his father's death in 1598 he became and remained the chief minister of the crown until his own death.

His chief rival for the favour of Elizabeth I was Robert Devereux, 2nd earl of Essex. He had already had a tussle with the earl over the appointment of the attorney general in 1594 when his candidate, Sir Edward Coke, was preferred to Bacon, whom Essex supported. When Essex was on trial for rebellion in 1601 he alleged that Cecil had once said that only the Spanish infanta had any claim to succeed Elizabeth. Cecil's denial was supported by the witness Essex named. The incident had an important bearing upon his future because he could now disprove the false rumours which had reached James VI of Scotland that the secretary was hostile to his claims to the English throne. In 1601 Cecil began a secret correspondence with the king and gave him the excellent advice not to plague Elizabeth formally to recognize him as her successor, but to be careful to cultivate her good will. James succeeded Elizabeth unopposed as James I of Great Britain and Ireland in March 1603 and retained Cecil as his chief minister.

Sir Walter Ralegh was accused of a conspiracy, on behalf of Arabella Stuart, a cousin of James and next to him in the line of succession, on whose behalf Spanish assistance was being sought, and was tried (November 1603) and condemned to death, but his sentence was commuted to imprisonment in the Tower. Cecil was held responsible for Ralegh's prolonged incarceration, but as it continued for four years after his death he was probably not blameworthy. He was one of the chief examiners of the conspirators in the Gunpowder Plot (November 1605) to blow up the two houses of Parliament, but the suggestion that he fabricated it to enhance his position has been decisively refuted. He was a persecutor of those Catholics who upheld the papal claims to depose heretical monarchs and release subjects from their allegiance. The test of loyalty for Catholics in the oath of allegiance of 1606 was willingness or refusal to denounce those claims. His tract, entitled *An Answere to Certaine Scandalous Papers* (1606), denied that he intended to exterminate all English Catholics. A Calvinist in doctrine but not in church organization, he felt that the "turbulent humours" of the Puritans necessitated their coercion. He was not,

like the king, an enthusiastic advocate of the union of England and Scotland, but he supported the plantation of Ulster and accepted the barony of Clogher in Tyrone, Ireland, of 12,500 ac.

Cecil was created Viscount Cranborne in 1604 and the next year earl of Salisbury. In 1608 he became lord high treasurer, and found that the king was £1,400,000 in debt. By new impositions on merchandise and other measures he reduced the debt to £300,000 but could not balance expenditures and revenue. He failed, however, to persuade the king to accept the Great Contract of 1610 by which the Commons were willing to grant £200,000 a year in return for the abolition of feudal dues worth £115,000. He was equally unsuccessful in curbing James's extravagances. In foreign affairs he negotiated peace with Spain in 1604, but sympathized with the Dutch in their war of independence. When the 12-year truce between Spain and the United Provinces was arranged in 1609, England joined France in guaranteeing the Dutch against any infringement of it by Spain. One of his last services was the betrothal of James's daughter Elizabeth to the Protestant Frederick V, elector palatine.

Salisbury died at Marlborough, Wiltshire, on May 24, 1612, worn out by his labours, and was buried in Hatfield Church, Hertfordshire. James gave him the nickname of "little beagle" because of his diminutive body. It is uncertain whether he ever occupied the new house he built at Hatfield, an estate he acquired by exchange with James for Theobalds, Hertfordshire. He was a good administrator but not a great statesman because of his lack of originality. He saw that the crown revenue was inadequate and that Parliament should supply the deficit, but failed to see that frequent applications to Parliament must change its relations to the monarchy. He tried to prolong the Elizabethan system after it had outgrown its usefulness but cannot be held responsible for James's attempts to magnify the royal prerogative.

BIBLIOGRAPHY.—The Salisbury papers at Hatfield have been calendared from 1306 to 1606, parts i–xviii (1883–1940), later material in progress, by the Historical Manuscripts Commission. Other letters are in *Correspondence of King James VI of Scotland with Sir Robert Cecil,* ed. by J. Bruce (1861); *The Secret Correspondence of Sir Robert Cecil with James VI,* ed. by Sir D. Dalrymple, Lord Hailes (1766); *Illustrations of British History,* 2nd ed. by E. Lodge, 3 vol. (1838); R. Winwood, *Memorials of Affairs of State,* ed. by E. Sawyer, 3 vol. (1725). A small tract, *The State and Dignitie of a Secretarie of Estates Place* (1642), reprinted in the *Harleian Miscellany,* vol. ii (1808) is ascribed to Salisbury. *See* also A. Cecil, *A Life of Robert Cecil, First Earl of Salisbury* (1915); P. M. Handover, *The Second Cecil: the Rise to Power, 1563–1604* (1959). (G. Ds.; X.)

SALISBURY, ROLLIN D. (1858–1922), U.S. geologist, was born at Spring Prairie, Wis., Aug. 17, 1858, graduated from Beloit College in 1881, and later spent a year in graduate study at the University of Heidelberg, Ger. He taught successively at Beloit College, at the University of Wisconsin, and, from 1892, at the new University of Chicago. From 1899 until his death Aug. 15, 1922, he was dean of Chicago's Ogden Graduate School of Science. Salisbury's chief researches were in glacial geology. His early studies made famous the "driftless area" of the upper Mississippi Valley. In 1895, as a member of the Peary Relief Expedition, he studied glaciers in Greenland. His most systematic field work was on the Pleistocene formations of New Jersey. In 1904–06 appeared the three volumes of *Geology,* written jointly with T. C. Chamberlin. (R. T. CN.)

SALISBURY, THOMAS DE MONTAGU, 4TH EARL OF (1388–1428), was son of John, the third Montagu earl, who was beheaded and attainted of treason (1400) for revolt against Henry IV. Summoned to Parliament as earl of Salisbury in 1409, Thomas was not formally restored to his father's dignities until 1421. He continued his family's distinguished record in the war against France. His first expedition was in 1412, and from the Agincourt campaign in 1415 until his death, he was in France almost continuously. He took part in the naval engagement off Harfleur (1416), and in 1417 sailed again to France with Henry V, distinguishing himself in the attack on Rouen (1418) and in other sieges in Normandy. In 1419 he was rewarded by the grant of the *comté* of Perche, and he was appointed lieutenant general of Normandy. In 1421 he accompanied Thomas, duke of Clarence, into Maine, but did not reach Baugé with the infantry in time to assist the duke, who had prematurely engaged the enemy there and was defeated and killed (March 22, 1421). Salisbury then led a successful raid into Anjou.

When Henry V died (1422) the earl became an active lieutenant of John, duke of Bedford, the regent of France. He daringly led an Anglo-Burgundian force from Burgundy across the River Yonne to defeat a French army besieging Cravant (July 30, 1423), and his "judgement and valour" were vital to Bedford's victory at Verneuil (Aug. 17, 1424). Appointed governor of Champagne in 1423, Salisbury gradually gained control of that province. Operations in Champagne and Maine and the defense of the Norman border engaged him until he left for England late in 1426. He returned to France with reinforcements in July 1428. It is likely that he began his last campaign with instructions to attack Angers, but instead he chose to besiege Orléans. On Oct. 27 he was wounded by a cannonball which struck the window in Tourelles, a nearby fortification, from which he was surveying the city; he died at Meung-sur-Loire on Nov. 3, 1428. By his first wife, Eleanor Holand, daughter of Thomas, earl of Kent, Salisbury had an only daughter, Alice, through whom the earldom of Salisbury passed to her husband, Richard Neville (*see* NEVILLE; MONTAGU). His second wife, Alice, daughter of Thomas Chaucer and granddaughter of the poet, subsequently married William de la Pole, earl (later duke) of Suffolk.

See J. H. Ramsay, *Lancaster and York* (1892); A. H. Burne, *The Agincourt War* (1956). (J. W. SE.)

SALISBURY, WILLIAM LONGSWORD (LONGESPÉE), 3RD EARL OF (d. 1226), an illegitimate son of Henry II of England, and a prominent baron, soldier, and administrator under John and Henry III. He acquired his lands and title from Richard I who in 1196 gave him the hand of the heiress Ela, or Isabel, daughter of William, earl of Salisbury. He held numerous official positions in England under John.

He was sent on missions to France (1202) and to Germany (1209). In 1213–14 he organized John's Flemish allies, taking part in the destruction (1213) of the French fleet at Damme, then the port of Bruges, and leading the right wing of the allied army at Bouvines (July 27, 1214), where he was captured. He was exchanged and was back in England by May 1215, when he was employed by John in inspecting the defenses of royal castles and fighting the rebels in the southwest. He is among the loyal barons listed in the preamble of Magna Carta, but his presence at Runnymede is not certain.

During John's war against the barons Salisbury deserted the king after the landing of Louis of France (May 1216), but returned to royal allegiance by March 1217, fought at Lincoln (May) and Sandwich (August), and attested the Treaty of Kingston (September 1217). He held various posts during the minority of Henry III and served against the Welsh in 1223 and in Gascony in 1225. He died at Salisbury on March 7, 1226. He and his wife were benefactors of Salisbury Cathedral and laid foundation stones of the new cathedral in 1220. William was buried there and his effigy, a splendid early example, still survives.

See S. Painter, *The Reign of King John* (1949); F. M. Powicke, *King Henry III and the Lord Edward,* 2 vol. (1947). (J. C. Ho.)

SALISBURY, a city and municipal borough of Wiltshire, Eng., is situated in the southeast of the county at the junction of the Avon and Wylye rivers, 24 mi. (38.6 km.) W of Winchester by road. It is officially known as the City of New Sarum and is an Anglican bishopric and a parliamentary constituency. Historically it is the principal town of Wiltshire, although Trowbridge is the centre of local government. Pop. (1961) 35,492.

The centre of the city remains much as it was in the Middle Ages, divided into square blocks of houses by streets at right angles to each other. Through most of these streets watercourses ran until 1852. The architecture is small-scale and friendly, most of the houses having warm tiled roofs. A large number of timber-framed buildings survive, some of them behind Georgian fronts, but serious inroads have been made into this pattern by undiscriminating development.

The cathedral stands in the spacious walled Close, containing medieval canonical and other houses, on the south side of the

town. The Close is entered on the north from the High Street, the principal shopping street, and there are three other ancient gates. The graceful cathedral was built between 1220 and 1258 in the Early English style throughout; the tower and spire (404 ft. [123 m.], the highest church spire in England), both in the Decorated style, were added in the 14th century. The architect James Wyatt, under Bishop Shute Barrington, carried out extensive interior alterations at the end of the 18th century.

A general market is held in the Market Square. The October Fair also held there is probably the fair granted on St. Remigius' Day (Oct. 1) by a charter of 1269. In the Guildhall, a severely classical building of 1795 in the southeastern corner of the square, the assize courts and magistrates' courts are held. The Council House on Bourne Hill is on the site of the 13th-century College of St. Edmund for secular canons. The Salisbury, South Wilts and Blackmore Museum (1860) in St. Ann Street holds important archaeological and historical collections of south Wiltshire material. Two merchants' halls survive, that of John Halle (*c.* 1470) in the New Canal, and that of the Webb family in Crane Street, now a part of the Church House. Surviving guildhalls include the Joiners' Hall and the Cordwainers' Hall. There are two ancient hospitals, Trinity Hospital and St. Nicholas's, now old people's homes. The 15th-century Poultry Cross has been greatly restored. The medieval parish churches are St. Thomas's, St. Martin's (both mainly 15th century), and St. Edmund's. There are several Roman Catholic and Nonconformist places of worship. The road approaches to Salisbury have been considerably disfigured by unsightly commercial building, but the ancient entity of the central part, bounded on the south and west by the Avon and formerly by an earth rampart on the other two sides, has not been lost.

Salisbury is a shopping and a tourist centre, being within easy reach of Stonehenge (*q.v.*), Old Sarum (*see* below), and many fine country houses. The main occupations are cattle and poultry marketing, engineering, brewing, leatherwork, typesetting and printing, the manufacture of visual colour-measuring instruments (tintometers) and fireworks, and the production of farm seeds. Schools include the Godolphin School and the South Wilts Grammar School, for girls, Bishop Wordsworth's School for boys, and the cathedral choristers' school. There are teachers' training and theological colleges and colleges of art and further education.

History.—The origins of Salisbury lie in Old Sarum, 1½ mi. (2.4 km.) to the north of the present town. This was an Early Iron Age hill fort which was taken over by the Romans. Under the Saxons it became an important town, and by the 11th century it possessed a mint. The Normans built a castle on the mound and Old Sarum became a bishopric when the see was transferred from Sherborne in 1075.

The first cathedral, a small basilica, was completed by St. Osmund (the second bishop) in 1092 and was immediately wrecked in a storm. Osmund began the introduction of new customs and ceremonies which later became widely known as the Sarum Use (*q.v.*). The cathedral was rebuilt by Bishop Roger (1107–39), but friction increased between the castellan of the castle and the bishop and Pope Honorius III gave permission for the removal of the see. In 1220 the present cathedral was founded in the valley and the new city quickly grew up round it, receiving a charter from Henry III in 1227. The bishop as lord of the manor of Milford was overlord of the city which was within the manor, and the history of Salisbury is largely the struggle of the citizens to be free of the bishop's control. The charter of James I (1612) put an end to the temporal authority of the bishop.

In 1228 Bishop Bingham built Ayleswade Bridge over the Avon at Harnham, thus deflecting trade from the older town of Wilton. The first mayor was appointed in 1261, and in the same year Bishop Bridport founded the College of St. Nicholas de Vaux, the first university college in England, which was attended by students from Oxford. Two friaries, Black and Grey, were founded in the 13th century. In 1302 the citizens refused to pay tallage to the bishop but capitulated in order to secure a new charter in 1306. An earthen rampart was built round the city in 1310, and soon afterward gates were added to the rampart.

At this time the wool and cloth trades flourished and wealthy merchants such as John Halle and William Swayne enriched the city and its churches. Another industry, that of cutlery, became prominent and Nell Gwyn paid 100 guineas for a pair of Salisbury scissors. In post-Reformation times tobacco pipes and pins were made and in modern times automobiles and motorcycles.

John of Salisbury, bishop of Chartres, the 12th-century scholar, was a native of Old Sarum. John Jewel and Gilbert Burnet are among the bishops of Salisbury who have enriched English literature. George Herbert, Henry Fielding, and Anthony Trollope had close associations with the city, and Rowlandson, Constable, and Turner found in Salisbury inspiration for their painting.

(H. DE S. S.)

SALISBURY, the capital of Southern Rhodesia and formerly of the Federation of Rhodesia and Nyasaland, lies in the north-eastern part of Southern Rhodesia, at an altitude of 4,865 ft. (1,483 m.) above sea level.

The climate is temperate, the average mean annual temperature being 65° F (18° C), and the average annual rainfall 31.92 in. (811 mm.). Greater Salisbury comprises the city and numerous adjoining satellite towns. The non-African population in 1961 was 94,550. African population, enumerated in 1962, was 215,810.

Salisbury was founded on Sept. 12, 1890, and named after the British prime minister, Lord Salisbury. Chartered in 1935, it is well laid out, with tree-lined avenues and, in the business and governmental centre, many multistoried buildings. Pearl Assurance House and Robinson House, standing 205 ft. (62 m.) and 163 ft. (50 m.) high respectively, are the tallest. The main streets run from north to south and from east to west. Notable buildings include the Anglican and Roman Catholic cathedrals, the Dutch Reformed Church, the Queen Victoria Memorial Library, and the town house. Adequate educational, medical, recreational, and cultural facilities have been established. The Central African Archives, the multiracial University of Rhodesia and Nyasaland, opened in 1957, and the National Art Galleries are in the city. The Salisbury Gardens and Cecil Square are the chief parks. Salisbury is on the main rail, road and air routes of Africa. The international airport is situated at Kentucky, close to the city. The city is the centre for the agricultural industry of Southern Rhodesia, of which Virginia tobacco is the main crop. A gold-mining area also surrounds it. Secondary industries range from clothing factories to steel foundries.

(F. J. LT.)

SALISBURY, a city of North Carolina, U.S., the seat of Rowan County, is located 120 mi. WSW of Raleigh in the rolling countryside of the industrial piedmont section midway between Charlotte and Greensboro. The town's tree-lined streets dotted with ante-bellum homes are reminiscent of colonial times when Salisbury was one of the six largest boroughs in the colony. Settled by Scotch-Irish and Germans in the mid-18th century and named for Salisbury, Eng., it was laid out in 1753 as the county seat. It was incorporated in 1755 and chartered in 1770. It has had a council-manager government since 1927.

Daniel Boone lived with his parents nearby from 1755 until 1767, and Andrew Jackson received his licence to practise law there in 1787 after studying for a year under Judge Spruce Macay. The British general Cornwallis pursued Gen. Nathanael Greene through Salisbury in February 1781, just prior to the Battle of Guilford Courthouse, and a small action occurred at Trading Ford 6 mi. E. During the American Civil War a large Confederate prison was established in an old cotton mill which housed, in the latter months of the war, 10,000 Federal prisoners of which about 6,000 died of starvation and disease. A national cemetery now marks the place where these unknown soldiers were buried in long trenches.

Salisbury has been sustained historically by the textile industry and, during the first half of the 20th century, by major repair shops of the Southern Railway, since abandoned. There has been marked diversification in small industries, and remarkable growth of livestock, small grain farming, and dairying activity in the immediate area. A 1,000-bed veterans hospital was completed there in 1953. Catawba College (1851) and Livingstone College (founded as Zion Wesley Institute in 1879) bulwark the town's cultural life. For comparative population figures *see* table in NORTH CAROLINA: *Population.*

(JA. S. B.)

SALISHAN, the linguistic stock of a large number of North American Indian tribes of southern British Columbia, western and northern Washington State, northern Idaho, and northwestern Montana. Distribution was continuous except for the west coast of Vancouver Island (Nootka [*q.v.*] tribe, Wakashan stock) and three tribal areas just south of Juan de Fuca Strait (Makah tribe, Wakashan; Quileute and Chemakum tribes, Chimakuan stock). One Salishan tribe, the Bella Coola (*q.v.*), resided north of the area and another south (Tillamook). Grammatical and lexical differences of a major order characterized the two principal divisions of the stock, coastal and interior, on the two sides of the Cascade-Coast Range. The many dialects of each often were mutually unintelligible. Tribes of the coastal division were of Northwest Coast culture; the interior division, Plateau culture. *See* also CENTRAL AND NORTH AMERICAN LANGUAGES; FLATHEAD; INDIANS, NORTHWEST COAST.

See W. W. Elmendorf, "Lexical Relation Models as a Possible Check on Lexicostatic Inferences," *Amer. Anthrop.,* vol. 64 (August 1962). (V. F. R.)

SALIS-SEEWIS, JOHANN GAUDENZ VON (1762–1834), Swiss poet whose work, influenced by Salomon Gessner, Klopstock, and L. H. C. Hölty, as well as by Rousseau's ideas, is tender and sometimes elegiac, celebrating friendship, humanity, and the serenity of nature. Some of his poems, such as "Lied eines Landmanns in der Fremde," became anthology pieces. He was born on Dec. 26, 1762, in Schloss Bothmar, near Malans in the Grisons, a member of an ancient Grison family. In 1779 he became an officer in the Swiss guards in Paris but he supported the ideas of the French Revolution and voluntarily remained in Paris until 1793. In 1799 he became chief of staff of the Swiss militia, taking part in the Battle of Zürich, and later filled several public offices. He died at Malans on Jan. 29, 1834.

G. von Salis-Seewis* (1934); A. Rufer, *Salis-Seewis als bündnerischer Patriot und helvetischer Generalstabschef* (1938). (M. We.)

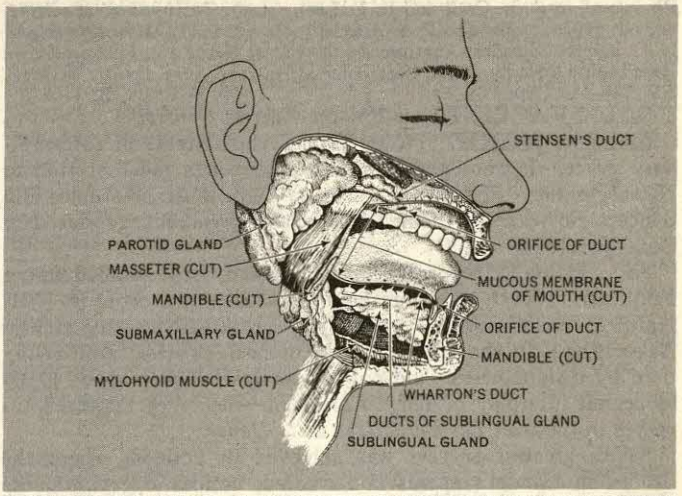
SÁLIVA, a tribe of South American Indians who lived near the Orinoco River in eastern Colombia (*q.v.*). Manioc was the major crop, supplemented with fish and game. Villages of one or more large communal houses were sometimes palisaded, giving evidence of warlike neighbours. The Sáliva had such tropical-forest traits as hammocks, dugout canoes, and signal drums; each village seems to have had a men's house. An ancestor cult is suggested by the exhumation and burning of bones of the dead, the ashes being drunk commemoratively in manioc beer. Religious leaders undertook curing and divination under the influence of a narcotic snuff. In the 1960s the Sáliva were largely acculturated to Colombian society.

See G. H. de Alba, "The Achagua and Their Neighbors," in *Handbook of South American Indians,* ed. by J. H. Steward, vol. 4 (1948). (SE. L.)

SALIVARY GLANDS are certain glands, located in the mouth, that secrete saliva, a substance whose chief functions are to moisten and soften food and to keep the mouth moist. Saliva also contains a digestive enzyme and thus takes part in the chemical as well as the mechanical digestion of food. Numerous glands in the walls of the oral cavity pour their secretions into the mouth (*q.v.*); they are lodged in the submucosal tissue of the lips, cheeks, gums, tongue and palate. They are numerous in the lips, less so in the cheeks; the lingual glands are richly distributed at the base and lateral margin of the tongue and on the undersurface on each side of the frenulum. The glands of the roof of the mouth make up a large portion of the palatal mucosa and submucosa.

In addition to the above-described glands, which are intrinsic to the mouth cavity, there are three larger pairs: the salivary glands proper. They are the parotid, the submaxillary and the sublingual.

Anatomy.—*Parotid.*—The parotid gland is the largest of the salivary glands and is situated between the ear and the ascending branch of the lower jaw. In cross section it is roughly triangular. The parotid is molded into the shape of a prism or wedge by the structures that bound the pit in which it is lodged. In front, the



ADAPTED FROM A. BIRMINGHAM, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

THE SALIVARY GLANDS AND THEIR DUCTS, WITH THE GREATER PORTION OF THE BODY OF THE MANDIBLE REMOVED TO SHOW THE SUBLINGUAL GLAND

gland embraces the ascending branch of the lower jaw; behind, it is delimited by the external opening of the ear, the styloid process of the temporal bone and the sternocleidomastoid muscle; on the deep (internal) aspect it approaches the wall of the pharynx; on the superficial (external) aspect it is covered by fascia prolonged upward from the platysma muscle of the neck. The gland is disposed in two partly overlapping leaves that are continuous behind at a so-called isthmus. The branches of the facial nerves course forward between these leaves, as do also branches of the external maxillary artery and tributaries of the external jugular vein. Accessory glandular masses are fairly common. They are likely to be situated above the parotid duct, sometimes partly overlapping it. The parotid duct terminates in a minute orifice, opposite the second molar tooth of the upper jaw. The parotid duct (Stensen's duct) crosses the upper part of the masseter muscle and then pierces the buccinator muscle on its way to the mouth; it is about two inches long.

Submaxillary.—The submaxillary gland lies deep to the posterior half of the body of the lower jaw; it is about the size of a walnut. The facial artery is embedded in the upper part of the gland. The submaxillary duct (Wharton's duct) runs forward to the sublingual papilla.

Sublingual.—The sublingual gland is placed farther forward than the submaxillary; it is like an almond in shape though larger; its outer flattened surface rests against the lower jaw; its ducts are small and numerous. Certain of the sublingual ducts unite to form Bartholin's duct, which empties into the submaxillary duct.

Embryology.—The submaxillary and sublingual salivary glands develop embryologically as solid outgrowths of the buccal epithelium that are canalized later, while the parotid appears first as a groove. The parotid is ectodermal in origin, all the others entodermal.

Diseases.—Among the diseases of the salivary glands is xerostomia. This rare condition, the result of arrested or diminished secretion of saliva (aptyalism), is of nervous origin. It probably is allied to the deficient secretion of saliva actuated by fear in ancient trials by ordeal. Dryness of the mouth in fever and in belladonna poisoning, though equally due to deficient secretion of saliva, is not included under the term.

Excessive salivation results from the action of certain poisons (*e.g.,* mercury, potassium iodide) and accompanies many diseased conditions of the mouth. In cancer of the tongue, floor of mouth, cheek or gingival border, salivation is one of the most distressing symptoms. Mercurial salivation disappeared largely after modern methods of treating syphilis were introduced, and at present is mainly the result of industrial conditions.

For the functions of saliva in digestion, *see* DIGESTION. *See* also ENZYMES; MOUTH.

SALK VACCINE: *see* POLIOMYELITIS: *Control.*

SALLÉ, MARIE (1707–1756), French dancer of extraordinary grace, elegance and dramatic power, was the first woman choreographer. She was also first to unify music, costumes and dance style with the theme of a ballet (*Pygmalion,* produced in London, 1734).

After childhood appearances in England, Sallé studied under Françoise Prévost, who sponsored her Paris opera debut in 1721. Never a virtuosa, Sallé was noted for her sensitive acting ability. As early as 1729, she had her partner discard the mask traditionally used by male dancers (and only formally abolished about 1770) to permit interplay of facial expression when they appeared together in the duet *Les Caractères de la Danse.*

Sallé's greatest success was achieved in London, where she danced in Handel's operas and created, besides *Pygmalion,* the brilliant solo *Les Caractères de l'Amour* and a ballet, *Bacchus and Ariadne,* which revealed her power as a tragic actress.

Returning to Paris, she danced the rose in J. P. Rameau's *Les Indes Galantes,* and attained great distinction as Hébé in *Castor et Pollux.* In 1740 Sallé retired from the opera, but continued to appear at French court performances until 1752. She was painted by Nicolas Lancret.

See Émile Dacier, *Mlle. Sallé* (1909). (LN. ME.)

SALLUST (GAIUS SALLUSTIUS CRISPUS) (86–*c.* 34 B.C.), Roman historian and one of the great Roman literary stylists. He came of a plebeian family from the Sabine town of Amiternum. After a gay youth in Roman society he took up public life to obtain the quaestorship and enter the senate. His intellectual energy and personal ambition brought him into conflict with Pompey and the nobles. As tribune of the people (52) he was among those who bitterly attacked Cicero during the trial of the political agitator Milo. A freedman of Pompey, Lenaeus, satirized him for his criticism of the great man. It was doubtless for political reasons as well as on grounds of vice that in 50 he was removed from the senate. Caesar made him quaestor again in 49 so that he regained senatorial standing. In the Civil War he commanded a legion in 48, without distinction, and failed to control mutinous troops in Campania in 47, but as praetor in 46 he rendered Caesar valuable service in Africa and fought at Thapsus. For this he was rewarded with the proconsular governorship of Africa Nova. His administration of the province laid him under prosecution for extortion. Although he escaped conviction, he had become wealthy enough to build a magnificent mansion and gardens in Rome—the *horti Sallustiani*—and to retire from public life and devote himself to history.

The *Catilinae Coniuratio* (or *Bellum Catilinae*), a study of Catiline's attempt at revolution (63), appeared in 44, and was followed by the *Bellum Iugurthinum,* which treated the war with Jugurtha in 111–106; both monographs survive complete. Then the *Historiae* in five books took up the events of 78–67, as a sequel to the work of L. Cornelius Sisenna; but only fragments (including speeches) remain. Sallust conceived the history of his age in terms of political degeneracy, which set in after the destruction of Carthage in 146. The war with Jugurtha, in his view, revealed the corruptness of the nobles, successfully challenged by popular leadership under Marius, despite his faults; Sulla intensified the troubles of the state, and after him both the nobles and Pompey proved unworthy to govern; the subsequent moral chaos threw up Catiline. His judgment involved an ideal of public morality, which declined through ambition, avarice and luxury, and this he expounds in his prefaces. Some critics have considered him a mere party propagandist who chose to write about Catiline in order to create an opportunity to exonerate Caesar from charges of complicity in the plot and who chose his ground in the other works so as to attack the senatorial regime; but his real scope is wider, and he castigates not only the nobles but their rivals. His prefaces are not merely platitudinous; they provide the key to his selection of material. His conception, in fact, represents the political issue between the nobles, who regarded birth as the qualification for leadership, and the popular leaders, who—as Marius states in the *Jugurtha*—held that ability established the right to rule. He applies this test of "Roman virtue" against the nobles, stressing it by his very praise of Cato, but equally against their unscrupulous rivals, apart from Q. Sertorius and Caesar. His analysis is too penetrating to be merely partisan —whatever secondary motives he had—but it is historically rigid. Rome was more unsettled before 146, less venal in 111, than he admits. His setting of Catiline's conspiracy may exaggerate its significance, just as it reduces the part of Cicero. His pattern of generalization led to chronological errors in detail.

As a stylist and in his generalizations about events Sallust shows the influence of Thucydides—with a Roman interest in typical personalities. What he grasps politically, he depicts dramatically, with an eye for a historical scene. In applying traditional standards he had recourse to the elder Cato, whose robust archaic style he consciously imitated. But he has a mordant, aggressive power of expression, which is his own. His style is an artificial creation —he took professional advice over it—and he fuses archaism with rhetoric, common speech with conventional vocabulary, under the pressure of a syntactical technique that used asymmetry and antithesis to point his distinctive analysis. The form of his language represents the character of his thought, as he conceived his theme. Occasional obscurity is the price for a powerful severity: his reward was to inspire Tacitus.

Doubtful Attributions.—Certain anonymous pieces in Sallust's historical style, which appear alongside his work in the manuscripts, have been dubiously attributed to him. An attack on Cicero (*Invectiva in Ciceronem*) in terms of the year 54 seems certainly spurious. Of two letters addressed to Caesar (*Epistulae ad Caesarem senem de re publica*) the first reflects conditions in 46, the second those in 49 (if not in 51 or 50). Both appear well-informed, but standard histories could have provided the material; and the second letter contains anachronisms that mark it as a later work. Stylistic comparisons may be deceptive, because Sallust was a likely object for imitation. In an age of literary conventions he would hardly have composed an "open letter" in his archaic historical style. In any event he had probably not evolved it before 45, and so even the first letter falls under suspicion.

SALMAN AL-FARISI, a Companion of the Prophet Mohammed, a popular figure in Muslim legend, and the national hero of Muslim Persia, was, as the name indicates, a Persian ("Solomon the Persian"). While still a boy he became a Christian, left his father's house, and embarked on a long religious quest. Salman first contacted Mohammed about the time of the Prophet's hegira (emigration) to Medina (A.D. 622). Legend recounts that Salman, living in Syria, had heard of the new Arabian prophet and set out to find him. Bedouin guides hired for the journey betrayed him, however, and sold him into slavery. Eventually Salman reached Medina, became a Muslim, and with the miraculous help of Mohammed purchased his freedom.

The most important event connected with Salman is the "Battle of the Ditch." In the year A.H. 5 (A.D. 627) the Meccans mounted a massive attack upon Mohammed's stronghold in Medina. Mohammed's vigorous harassment of Meccan caravans had neces-

sitated a decisive blow if the commercial life of Mecca were to survive. To protect Medina against cavalry charges, Mohammed caused a ditch or trench to be dug across the approaches to the town. This device had never been seen in Arabian warfare previously, and it so baffled the Meccans that they withdrew without pressing their attack. (*See* also MOHAMMED.) Salman is traditionally credited with suggesting the ditch, though some modern scholars question the role thus assigned to him.

Salman has also been important in Muslim religious thought. The moderate Shi'ah give him a special respect because of his nearness to the family of Mohammed, and the extreme Shi'ah count him one of the divine emanations recognized by their theology. Several Muslim mystical orders make him an important link in their chains of spiritual authority. (C. J. A.)

SALMASIUS, CLAUDIUS (CLAUDE DE SAUMAISE) (1588–1653), French classical scholar, best remembered for his least worthy work (a defense of Charles I), who, by his scholarship and judgment, acquired great contemporary influence. Born at Semur-en-Auxois, Burgundy, on April 15, 1588, he studied at Paris (1604–06), where he turned Calvinist, and at Heidelberg (1606–09), where he discovered the Palatine manuscript of the Greek Anthology (*see* ANTHOLOGY). In 1610 he became *avocat* of the Dijon *parlement*, but in 1629, as a Protestant, was not allowed to succeed his father as *conseiller*. In this year, his monumental commentary on Solinus' *Polyhistor* appeared. His erudition, especially in philology—he knew Hebrew, Arabic, Syriac, Persian, and Coptic, as well as Greek and Latin—led to invitations from several universities, and in 1631 he became professor at Leiden. There, despite jealousy, ill-health aggravated by the climate, and numerous incitements to return to France, he remained, except for a year (1650–51) at the Swedish court, until his death at Spa, on Sept. 3, 1653. His independence is also shown by his refusal, between 1640, when his *De primatu papae* (with an edition of two 14th-century anti-papal tracts) was announced, and 1645, when it was published, of several offers in exchange for a promise to withdraw it.

During the English Civil War, Salmasius was regarded as an ally by Presbyterians and parliamentarians, and at the time of Charles I's execution he was preparing, at the Scots' request, an attack on the Independent sects. At whose instigation he wrote a *Defensio regia pro Carolo I* (published anonymously November 1649) is not clear, but it seems certain that Charles II paid for the printing. It contains an attack on Independency, and, in contradiction of Salmasius' earlier views, a defense of prelacy as well as of the absolute monarchy. It provoked a *Defensio pro populo anglicano* (1651) from John Milton (*q.v.*). Also controversial were Salmasius' defenses of usury, *De usuris liber* (1638) and *De modo usurarum* (1639), which persuaded the Dutch church to admit moneylenders to the sacrament.

BIBLIOGRAPHY.—Salmasius' *Epistolae* were edited by A. Clément (1656), with biography; a manuscript life by Philibert de la Mare was used by P. Papillon, in his *Bibliothèque des auteurs de Bourgogne*, vol. 2 (1747), with list of works. *See* also G. Cohen, *Écrivains français en Hollande* (1920); R. Pintard, *Le Libertinage érudit* (1943).

SALMON, in the broadest sense, the common name of the fish family Salmonidae, which includes salmons proper, trouts, and chars. Commonly, the term is used for the Atlantic salmon (*Salmo salar*) and the six species of Pacific salmons (*Oncorhynchus*). These latter are *O. masu*, the "cherry" salmon found off Japan; *O. gorbuscha*, the pink or humpback salmon, ranging from the Arctic to Japan and the Klamath River; *O. nerka*, the sockeye or red salmon, ranging from northern Bering Sea to Japan and the Columbia River; *O. kisutch*, the coho or silver salmon, ranging from the Bering Sea to Japan and the Salinas River of Monterey Bay; *O. keta*, the chum or dog salmon, ranging from the Mackenzie and Lena rivers in the Arctic south to Japan and the Rogue River; and *O. tshawytscha*, the king, spring, or chinook salmon (earlier called also quinnat and tyee), ranging from the Yukon River to China and the Sacramento River. The Atlantic salmon ranges from the European Arctic to northern Portugal, Iceland, Greenland, the Ungava Peninsula of Quebec, and formerly south to Connecticut. Lake populations of Atlantic salmon are called ouananiche, landlocked salmon, or sebago salmon.

average about 23 lb., but individuals of 50 to 80 lb. are not uncommon. Chum salmon average about 10–12 lb.; coho salmon, 7–10 lb.; sockeye, 4–7 lb.; and pink salmon 3–6 lb.

Pacific salmon are anadromous; *i.e.*, they live most of their life in the ocean, but as adults they return to the stream where they hatched in order to spawn. To spawn, the female digs a pit in the stream gravel into which she and a male spawn simultaneously; she then covers the eggs with gravel. Adult Pacific salmon die soon after spawning, but many Atlantic salmon return to the sea and after one or two years in open waters may spawn again, some up to three or four times. Most spawning takes place in late summer or fall, when temperatures are dropping, and the eggs usually hatch in late winter. Incubation rates depend on temperature, taking about 60 up to 200 days. After hatching, the fry consume the yolk in the attached sac before wriggling up through the gravel to seek food. Young pink salmon descend immediately to the sea, other anadromous young remain longer. Chum salmon leave in a few weeks; coho salmon remain a whole year in the streams. Young of king salmon and Atlantic salmon may remain feeding in streams from one to three or more years. Young sockeye salmon dwell one to five years in lakes before migrating seaward. A race of sockeyes that matures in lakes and spawns in tributary streams is called kokanee.

Spawning grounds may be close to the sea, but the king and the chum salmons swim more than 2,000 mi. up the Yukon to spawn in its headwaters. Sockeye ascend the Fraser River for more than 700 mi. to spawn east of the Alaska panhandle. The migrating hordes of salmon, compelled by instinct, fight rapids and leap high falls until they reach their natal stream. Many pink salmon spawn on tidal flats where the water becomes salty on every tide.

Atlantic salmon, although fished commercially in certain areas such as Iceland, Newfoundland, and the Gulf of St. Lawrence, are valued chiefly as a sport fish. Fishing rights are leased for large sums along rivers in Europe and Canada. The king and coho

salmons are prized sport fish in the larger rivers of the Pacific coast. The commercial fishery of Atlantic salmon nets only a few million pounds annually, but that of the Pacific salmon is close to 2,000,000,000 lb., of which nearly half is pink salmon, one-third chum salmon, and all but about 5% of the remainder sockeye. *See* also FISH and FISHING; and references under "Salmon" in the Index.

SALOME, the name of several women in Jewish history.

SALOME ALEXANDRA (d. 67 B.C.), wife of the Maccabean king Aristobulus I (104–103 B.C.) and possibly the same Salome as the wife of his brother and successor Alexander Jannaeus, who as sole ruler (76–67) favoured the Pharisees. (*See* MACCABEES; JEWS: *Earliest Times to* A.D. *135: Greek and Roman Conquests.*)

SALOME (d. A.D. 10), sister of Herod the Great.

SALOME (fl. 1st century A.D.), granddaughter of Herod the Great, and according to Josephus the daughter of Herod Antipas and Herodias. She was twice married (again according to Josephus), first to her uncle Philip the Tetrarch, and second to Aristobulus, king of Lesser Armenia. This Salome has been traditionally identified with the young daughter of Herodias (presumably by her first husband, Philip, Herod Antipas' brother) who according to the Gospels of Mark (6:14–29) and Matthew (14:1–12), where she is unnamed, was the immediate cause of the death of John the Baptist. Herod Antipas had imprisoned John for condemning his marriage with his deceased brother's wife, but was afraid to execute him. However, when Herodias' daughter danced before him and his guests at a festival, he promised to give her whatever she asked. Prompted by her mother, Herodias, the girl demanded the head of John the Baptist on a platter, and the unwilling Herod was forced by his oath to have John beheaded.

This story, which is quite likely true, proved popular in Christian art from an early period. Oscar Wilde's *Salome* (1893) was translated by Hedwig Lachmann as the libretto for Richard Strauss's opera of the same name (1905).

SALOME (1st century A.D.), wife of Zebedee and mother of the apostles James and John; she should perhaps be identified with the sister of Mary the mother of Jesus (John 19:25).

SALOMON, ALICE (1872–1948), German social worker and founder of one of the earliest schools of social work, was born April 19, 1872, in Berlin. She was one of the first women granted a Ph.D. from the University of Berlin (1906), where her doctoral thesis concerned the inequality of pay between men and women doing equivalent work.

Convinced of the need for special training for social workers, in 1899 Miss Salomon organized regular training courses which soon evolved into the first German social work school, of which she was president until 1928 and which was named the Alice Salomon School in her honour in 1932. As president also of the federation of German schools of social work, her ideas and influence spread throughout that nation and to other countries. Miss Salomon was active in international feminist work and wrote on problems of public health and on the position of women and children in industry. In 1937, exiled from Nazi Germany, Miss Salomon went to the United States where she continued her work as a lecturer on social work administration. She died Aug. 30, 1948, in New York City.

(M. C. E.)

SALOMON, HAYM (1740–1785), early American financier and patriot, was born in Lissa, Pol., in 1740. He moved to America following revolutionary activities in defense of Polish liberty.

When he arrived in New York, he established himself as a commission merchant, and his personality and keen discernment soon made him a successful financier. During the American Revolution, Salomon was with the patriotic party known as Sons of Liberty. Within a short time he was made financial agent of the French government, for which services he accepted no commission. His ability and patriotic activities brought him to the attention of Robert Morris, the financier of the Revolution, who assigned him to the office of the superintendent of finance, where he handled bills of exchange.

Among his many other contributions to the colonies, Salomon subscribed heavily to government loans, endorsed notes, gave generously to soldiers and statesmen, and equipped several military units with his own money. He was made interpreter during the war, and was permitted to go into the British lines, but on two occasions was thrown into prison. He escaped, but suffered ill-health from exposure, which later led to his death.
